GLANVILL, or **GLANVIL, JOSEPH**, was born at Plyouth in 1636. He received his education in the unirsity of Oxford, and, in 1666, obtained the cure of bey-church at Bath; in 1678, he became prebend of e church of Worcester, and died at Bath on the 16th of ovember 1680, in the forty-fourth year of his age. This iter, the first who, in England, presented philosophical epticism under a systematic form, deserves more marked tention than has hitherto been accorded to him; nor can e observe without surprise that Brucker has not given m any place in his *Critical History of Philosophy.* There e two kinds of scepticism, essentially distinct; one which, professing absolute doubt, tends to condemn human ason to a mortal lethargy; and another which, produng only a relative doubt, serves rather to excite reason, a wise distrust of itself, to more severe and rigid examination. The first is only an arm of destruction; the cond is an instrument of censure and probation. It was is latter kind of scepticism to which Glanvil wished to ve systematic preparation, by tracing out an intermeate path between that dogmatism which blindly affirms ery thing, and Pyrrhonism, which denies every thing a manner equally blind. Two parties then existed in ngland; one of which abused the name of philosophy, order to accredit atheism, and the other abused the me of religion, in order to justify superstition. Glan- deplored this double aberration; he felt that philosoy itself required a reform, and he laboured to prepare ther than to produce it himself. It is in this light, and om this point of view, that his writings should be studied and judged. Of these, the two principal, both in English, are, first, *The Vanity of Dogmatising*, or Confidence in Opinions, manifested in a Discourse of the shortness and uncertainty of our knowledge of its principles, with Reflections on Peripateticism, and an Apology for Philosophy, 1661, in 8vo; and, secondly, *Scepsis Scientifica*, or confessed Ignorance the way to Science, an essay on the vanity of dogmatising, and confident opinion, London, 1665, in 4to. The latter of these works procured him the honour of being admitted a member of the Royal Society of London. Montaigne and Charron appear to have served as his guides, and he has borrowed much from both; he reviewed the principal objects of human knowledge, and endeavoured to show, in regard to each of these, the weakness and impotence of reason. The peripatetic doctrine, and the system of Descartes, which he appears to have especially had it in view to combat, themselves furnished him with arms; and in the rapid advancement of physical science at this period, he also endeavours to discover grounds for rendering more sensible our ignorance in the study of nature. Hobbes is the frequent object of his criticism. In general he seeks to prevent the abuse of rational speculations; and it is only in the observations to which they have led that he seeks for considerations fitted to inspire the distrust which he inculcates. His views respecting the sources of human error are presented with much perspicuity and method, often with striking novelty. The manner in which he treats the great question of causation is the more remarkable, because it appears to have opened the way to Hume in an investigation which has produced one of the greatest revolutions which philosophy has experienced in our time. According to him, we know only that things occur, and succeed one another, not how they are produced; we see their relation of coincidence, but not the tie which connects them; and hence the relation of the effect to the cause is, as far as we are concerned, a fact, and not a veritable law. Glanvil compares dogmatism to a narrow prison, in which the human mind is confined, and beyond the walls of which it cannot extend its view. The offspring of ignorance and of pride, dogmatism is, according to him, the father of errors; and scepticism is called in to apply a remedy, not by employing negations as arbitrary, but by weighing with impartiality the proofs. Doctrine like this was, however, liable to be mistaken or misrepresented; and we need not wonder, therefore, that, at the period when Glanvil wrote, he was considered by the greater number of readers as an absolute sceptic, and treated as such. The partisans of the prevailing systems regarded with more aversion the men who provoked discussion, than they did those persons who rejected their doctrines without examination. Hence Glanvil was very warmly attacked; but he justified himself in his answer to one of his opponents, which is subjoined to his *Scepsis Scientifica;* and he also undertook the defence of philosophy, conceiving that this belonged of right to those who desired to bring her back to her proper and legitimate sphere. It is singular enough, however, though by no means without example, that this writer, who had not only shown, but even exaggerated, the infirmity of human reason, paid himself a strange tribute to its weakness; for, after having combated scientific dogmatism, he not only yielded to vulgar superstitions, but actually endeavoured to accredit them in his Philosophical Considerations concerning the existence of Sorcerers and Sorcery, published in 1666, in 4to. The story of the pretended drum, which was said to have been heard every night in the house of an inhabitant of Wiltshire (Mr Mumpesson), a story which made much noise in the year 1663, and which is supposed to have furnished Addison with the idea of his comedy of the *Drum*, appears to have given occasion to this work. It might have been imagined that such a tale would have been treated with derision by Glanvil, and that the philosopher could have had no other object than to turn into ridicule the credulity of his country. For such a supposition, however, there seems to be little or no room, and, in point of fact, this production gave rise to a controversy, which only terminated with the life of Glanvil. At his death he left a piece entitled *Sadducismus Triumphans*, which was printed in 1681, 8vo, reprinted with some additions in 1682, and translated into German in 1701. He had there collected twenty-six relations or stories of the same description as that of the Drum, in order to establish, by a series of facts, the opinion which he had expressed in his Philosophical Considerations. Glanvil supported a much more honourable cause when he undertook the defence of the Royal Society of London, under the title of *Plus ultra*, or the Progress and Advancement of Science since the time of Aristotle, 1658, in 12mo. His object was to refute a foolish ecclesiastic who had alleged that Aristotle possessed individually more knowledge than could be found in the Royal Society, or even in all the men of the seventeenth century. By this production he drew upon himself a violent antagonist in the person of one Stubbe, a physician at Warwick; but, after an animated dispute, the doctor, by some mischance, lost his life, and his generous antagonist, in a funeral sermon which he preached on the occasion, pronounced an eulogium on his memory. Besides the works already noticed, Glanvil wrote, 1. Lux Orientalis, 1662; 2. Philosophia Pia, or Discourse on the Religious Character, and the Tendency of Experimental Philosophy; 3. Essays on several important subjects in Philosophy and Religion, 1676, in 4to; 4. An Essay concerning Preaching; and 5. Sermons. After his death in 1681, there were published sermons and other posthumous works in one volume 4to. The style of Glanvil is clear, easy, and animated; and to the student of the philosophy of the human mind his works are full of instruction. (A.)

GLARUS, one of the Swiss cantons, is bounded on the north and on the east by St Gall, on the south by the canton of Gray Bunden, and on the west by those of Uri and Schwytz. It extends over 467 square miles, and contains 26,570 inhabitants. The canton consists of two valleys between the snow-covered mountains Todi, 11,037, and Kistenberg, 10,690, feet in height, towards the south; and towards the north the mountains of less elevation, viz. the Garn, the Hausstoch, the Martinsloch, the Plattenburg, and the Schilt, which vary from 6300 to 8800 feet in height. Although the valleys are narrow, they are moderately fertile; but the chief supply for subsistence is derived from the pasture on the mountains, on which, during the summer season, more than 10,000 cows and 5000 sheep are fed. Though the small portion of arable land is well cultivated, it does not produce sufficient corn for the consumption of the inhabitants; but the deficiency is made up partly by potatoes and fruit, and partly by the exchange of Schabzuger cheese and wood, for what is wanted. A part of the inhabitants find employment in manufactures of woollen and cotton, of hosiery and caps, and in what was formerly of greater consumption than at present, namely, making slates for writing, which are sent by the Rhine to Holland. The government is a pure democracy, in which all the inhabitants who possess property have an equal share of political power, and equally assist in defending their country. The executive magistrate is the landamman. The religion is partly Protestant reformed, and partly Catholic. Those of the former sect are the majority, and choose all the magistracy for five years, and the latter for three years. When the Catholics are chosen to offices, they are selected by the Protestants; and when the Protestants' turn comes, the individuals are nominated by the Catholics. The two sects have their separate tribunals in civil and criminal matters. This canton contributes to the general confederacy 1615 francs yearly, and provides a contingent of 482 men for the common defence of the states.

GLARUS, a town, the capital of the Swiss canton of that name, is situated under the mountain Garnish, which is nearly 9000 feet in height. It contains about 3000 inhabitants, who are employed in various manufactures. The general assembly of the cantons is held in a meadow near the town. Long. 8. 57. 50. E. Lat. 47. 2. 43. N.

GLASGOW,

A GREAT commercial and manufacturing city of Lanarkshire, in Scotland, situated on the northern bank of the river Clyde. According to the determination of Dr Wilson, formerly professor of astronomy in the university of Glasgow, the latitude and longitude of the Macfarlane Observatory, in the College Garden of Glasgow, are, 55° 51′ 32″ north, and 4° 17′ 54″ west. Glasgow is therefore nearly eight miles farther south than Edinburgh, and 1° 1′ farther west. The difference between the clocks in Edinburgh and Glasgow is 4′ 27″·4.

See of Glasgow.—There is no authentic record of the origin of Glasgow. Its name in the Gaelic language is interpreted by some as signifying a grey smith, whilst others think it means a dark glen, in allusion to the ravine near the cathedral, where a primary settlement appears to have been made. Although Glasgow was an early seat of the church, historians do not agree as to the time when the see was founded. That it was next to St Andrews in point of antiquity is beyond all doubt. With regard to its founder, Kennet, in his *Parochial Antiquities*, says, it was instituted by Kentigern or St Mungo, in the year 560. Dr Kelyn, speaking of the see of St Asaph in Wales, observes that "the see was founded by St Kentigern, a Scot, in 583," and that "St Kentigern was then Bishop of Glasgow." From these authorities it may be inferred that St Mungo founded the see of Glasgow, and became the first bishop; and that when a cathedral of sufficient grandeur was finished, it would be dedicated to St Mungo. Baldrade, St Mungo's disciple, who founded a religious house at Inchinnan, is said to have succeeded him in the bishopric. There is no record of the town or of the see for more than five hundred years after this period. This great blank cannot be accounted for with any degree of certainty. Amongst other conjectures, there is one, that the church had been destroyed by the ravages of the Danes, who murdered or drove off the religious persons who had settled in Glasgow.

In the year 1115, David prince of Cumberland refounded the see; and having in the year 1124 succeeded his brother Alexander I. on the throne of Scotland, he promoted his chaplain, John Achaius, to the bishopric in 1129. In 1133 the cathedral was solemnly consecrated in presence of the king, who endowed it with the lands of Partick. In 1165 Pope Alexander III. issued a bull commanding the faithful to visit the cathedral of Glasgow. In 1176 Bishop Joceline enlarged the cathedral, and rebuilt a part of it in a style more magnificent than formerly. In 1300 Edward I. of England, assuming authority in Scotland, appointed Anthony Beik to the see of Glasgow; and at the same period Earl Percy took possession of the episcopal palace. This had no sooner taken place than Sir William Wallace, with his friend James Cleland, and a few chosen followers, indignant at the usurpers, gave them battle in the High

Seet, when Lord Percy was killed, and the English route In the year 1426 Bishop Cameron established the cnmissary court, and increased the number of prebendies of the cathedral to thirty-two. In 1450 Bishop Turnbl obtained a charter from James II. erecting the town a patrimony of the bishopric into a regality. In 1488, tt is, in Bishop Blackadder's time, the see of Glasgow ws made archiepiscopal. This bishop, along with the Earl o Bothwell, negotiated a marriage between King James I. of Scotland, and the Lady Margaret, eldest daughter o King Henry VII. of England, which they brought about, tthe mutual satisfaction of both kingdoms. This union ll the foundation of the title of the Scottish kings to the Eglish throne, to which in right of proximity of blood Kg James VI. of Scotland succeeded upon the demise o Queen Elizabeth.

The revenues which had been granted from time to time i support of the splendour of the see of Glasgow were vy considerable. The archbishops were lords of the lordsps of the royalty and baronies of Glasgow ; besides, there wre eighteen baronies of land which belonged to them whin the sheriffdoms of Lanark, Dumbarton, Ayr, Renfw, Peebles, Selkirk, Roxburgh, Dumfries, and the Stewary of Annandale, including 240 parishes. There was a a large estate in Cumberland within their jurisdiction, wich was named of old the spiritual dukedom. When the s was made archiepiscopal, jurisdiction was given over t bishops of Galloway, Argyle, and the Isles. At the l formation in 1560 Archbishop Beaton retired to France, ting with him all the relics, documents, and plate which ptained to the see and the archbishopric. Since the renation of the see there have been twenty-six Roman Catlic bishops; the first, John Achaius, elected in 1129, al the last, George Carmichael, in 1483: and four Rorn Catholic archbishops; the first, Robert Blackadder, i 1488, and the last, James Beaton, in 1551. From the l formation till the Revolution the church in Glasgow vs governed by fourteen Protestant archbishops; the ft, James Boyd, elected in 1572, and the last, John Patson, in 1687.

Corporation of Glasgow.—Glasgow was governed by a povost and bailies as early as the year 1268. In 1605 t constitution of the burgh was settled in three distinct ldies, viz. the town council, the merchants', and the trades' luses. The town council consisted of certain persons from t ranks of the merchants and trades. In 1801 some altation was made in the constitution; and from that perd till 1832 the corporation consisted of a provost, five llies, twelve councillors from the merchants and eleven tm the trades, a master of work, and a treasurer; the rbal and water bailie were chosen from the council, who cted themselves. One third went out of the council ery year, and could not return for three years. The rchants' house sent a list of three persons to the coun, from which they elected one to be dean of guild; and i the same manner the trades' house, when one of the tree was elected convener.

In 1832, after the passing of the burgh reform bill, the vn council was chosen by the parliamentary constituency, nsisting of upwards of 7000 persons who paid an yearly nt of L.10 and upwards. The city is divided into five rds, each ward electing six councillors. The dean of ild and convener are elected by their respective houses. hen added to the councillors, they elect a provost, five ilies, a treasurer, and master of work; one third of the uncillors go out of office every year, but may be immeately re-elected. The revenue of the city varies from 15,000 to L.16,000.

Previously to the passing of the reform bill the burghs Glasgow, Renfrew, Dumbarton, and Rutherglen elected e individual to represent them in parliament; but since that bill has been in operation, the above-mentioned constituency for Glasgow returns two members to parliament.

Progressive Population.—There is no enumeration of the inhabitants of Glasgow that can be relied on before the year 1610 ; but there are grounds for supposing that about the time of the Reformation, in 1560, the population amounted to 4500. In 1610 when the episcopal form of government was resumed in the church, Archbishop Spottiswood directed the population to be ascertained, upon which it was found to amount to 7644. In 1660, at the restoration of Charles II., it amounted to 14,678. In 1688, at the Revolution, the population had decreased to 11,948. This diminution has been accounted for by the civil war, during which a number of the inhabitants were driven into exile. In 1708, immediately after the union with England, it amounted to 12,766. In 1712 the convention of royal burghs directed a census of the population to be taken, when it amounted to 13,832. In 1740 the magistrates ascertained it to be 17,034. In 1755 the population was 23,546 ; this was ascertained for the Reverend Dr Webster, then preparing his scheme for the Widows' Fund of the Church of Scotland. In 1763 Mr John Woodburn, the city surveyor, found it to be 28,300. In 1780 it had increased to 42,832 ; but in this enumeration all the suburbs were for the first time included. In 1785, soon after the American war, the population amounted to 45,889. In 1791 the population having been ascertained for Sir John Sinclair's national statistical work, amounted to 66,578, including 4633, a part of the suburbs which had been omitted in the return. Previously to 1801 the general results only were preserved, but in that year government for the first time caused a census to be taken, and the population was found to be 77,385, viz. males 35,007, females 42,378. In this enumeration a part of the population of the suburbs was not included; but if it had been added, the amount would have been 83,769. In 1811 there was another government enumeration, according to which the population amounted to 100,749, viz. males 45,275, females 55,474. In 1819 Dr Cleland drew up the first classified enumeration of the inhabitants of Glasgow, according to which the population amounted to 147,197, viz. males 68,994, females 78,203. In 1821 there was another government enumeration, when the population amounted to 147,043, viz. males 68,119, females 78,924. In 1831, at the last government census, the population was 202,426, viz. males 93,724, females 108,702. The population of Glasgow and its suburbs may now, after three years increase, be taken at about 220,000.

Glasgow Bills of Mortality.—As the Glasgow bills of mortality, from which the probability of human life in large towns, and other important results, may be deduced, have met with unprecedented celebrity, we think it right to give a detailed account of the manner in which these bills have been prepared. Bills of mortality are understood to contain a list of births, marriages, and deaths, taken from parochial registers at stated periods, in connection with the population. The parochial register of births in Glasgow being so defective that no reliance could be placed on it, Dr Cleland, to whom the country is indebted for the Glasgow bills, obtained the necessary information in the following manner.

On the 6th of December 1829, he addressed a letter to each of the seventy-five clergymen and lay pastors in the city and suburbs who baptize children, requesting to be favoured with returns of the numbers they might baptize from the 14th of December 1829 to the 15th of December 1830, both days inclusive, being the year previous to the last government census. The letter was accompanied by a book, in which the sexes, and the particular parishes in which the parents resided, were to be inserted. He also requested the various societies of Baptists, the Society of

Friends, and Jews and others, who do not dispense the ordinance of baptism to infants, to favour him with the above particulars relative to children born to members of their societies; and at maturity he had the satisfaction of receiving returns from the whole; as also an account of the children of parents who, whilst disapproving of infant baptism, did not belong to any religious society. It appeared, that in the city and suburbs there were 6397 children baptized, or born to Baptists, &c. and of that number there were only 3225 inserted in the parochial registers, leaving unregistered 3172.

Although in Scotland there is no marriage act, as in England, restricting the solemnization of marriages to clergymen of the established church, this ordinance can only be regularly celebrated by persons duly called to the pastoral office, and not until a certificate of the proclamation of banns has been produced. Persons irregularly married are deprived of the privileges of the church till they appear before the kirk-session, acknowledge their fault, and be reponed or restored. From this circumstance, in connection with the solicitude of the female and her friends to have the marriage registered, the marriage-register of Glasgow and its suburbs may be held as correct for all statistical purposes.

The deaths are ascertained by the number of burials. The burying-grounds in the city and suburbs are placed under the management of fourteen wardens. These officers, who attend every funeral, enter in a memorandum book, at the grave, the name, age, and designation of the person buried, along with the amount of fee received, and the name of the undertaker. Having taken these and other particulars, the wardens afterwards enter the whole in a book, classified conformably to a printed schedule drawn up by Dr Cleland. At the end of the year they furnish him with an abstract from their books; and it is from a combination of these abstracts that he ascertains the number of deaths at the various ages. The abstract includes still-born children, and the deaths of Jews and members of the Society of Friends who have separate burying-places.

Dr Cleland having been appointed to take the sole charge of conducting the enumeration and classification of the inhabitants of the city of Glasgow and suburbs for the government census of 1831, he employed twelve parochial beadles, nineteen mercantile clerks, and one superintendent of police, to take the lists. Before the books were prepared, however, an advertisement was inserted in the Glasgow newspapers, requesting the inhabitants to favour him with their suggestions as to classification; and before the list-takers commenced their operations, bills were posted upon the public places and dwelling-houses of the city, informing the inhabitants of the nature of the inquiries, and that they had no reference to taxes, and, moreover, that non-compliance, or giving a false return, subjected them to a fine. When the books were returned to him, the public, through the medium of the press, were requested to call at an office appointed for the purpose, and to correct any omission or error which might have been made in their returns. The list-takers having made oath before the lord provost, that the name of every householder in the district assigned to them, his or her age, profession, religion, country, &c. had been faithfully entered in a book, and a similar description of his or her family taken down, he proceeded to classification, and formed tables and abstracts for each parish, containing numerous details not required for the government digest.

Glasgow Bill of Mortality for 1830.

A General List of Births, Baptisms, Marriages, and Burials, within the ten Parishes of the Royalty, and the Suburban Parishes of Barony and Gorbals

Births and Baptisms.	Males.	Females.	Total.
Returns from Clergymen and Lay Pastors	3281	3116	6397
Add still-born, from do.	246	225	471
Total	3527	3341	6868
Of this number there were registered only	1678	1547	3225
Number unregistered, exclusive of still-born	1603	1569	3172

The children were baptized as follows, viz.

By clergymen of the Church of Scotland	3123
By ditto of the Secession Church	664
By ditto of the Relief Church	671
By ditto of the Roman Catholic Church	915
By ditto of the Scotch Episcopal Church, Independents, Methodists, and other denominations, including births among Baptists, Society of Friends, Jews, &c.	1024
Total	6397

Marriages engrossed in the registers of the city, Barony, and Gorbals:—In the city, 857; Barony, 691; Gorbals, 371; total, 1919.

Burials engrossed in the Registers of the City, Barony, and Gorbals Burying Grounds.

Before exhibiting results, it may be right to mention, at about twenty years ago the causes of death were an-unced yearly in a periodical, along with the gross number burials; but as no confidence could be placed in such atements, Dr Cleland has, since that period, declined to blish a list of diseases; but being aware, that if a correct t could be obtained at the census of 1831, when the po-lation, births, marriages, and deaths, were ascertained, would be very beneficial in a medical point of view, he dressed letters to upwards of 130 medical gentlemen in e city and suburbs, requesting that they would favour m with a return of the diseases of which their patients ed during the period in which he had requested the clergy-en to give him a note of baptisms. As he only succeed-l with a small portion of the members of faculty, how-er, the attempt became fruitless; and in all probability y future attempt will be unsuccessful, till a compulsory t of the legislature regarding parochial registers be ob-ined. Dr Cleland having been intrusted with drawing and classifying the government population returns for 21, he took the same precautions as to births, marriages, rials, and population, as in 1831, in the view of being le to ascertain the ages of the population, and the periods life at which death ensued, at particular epochs when e population could be accurately ascertained.

That Glasgow is a place of average health for statistical rposes may be inferred from the daily state of the wea-er, which Dr Cleland published in 1831, by which it ap-eared that the average quantity of rain which fell yearly ring thirty years preceding that period amounted to ra-er less that twenty-three inches. But, more particular-, the degree of health may be known, and tables formed r ascertaining the probability of human life, from a series of the mortality bills, where the ages of the living and those of persons who have died are stated in connection with the population, and a table of longevity for Scotland, which he prepared in 1821, by which it appeared that on an average of all the counties of Scotland, there was one person eighty years of age for every $143\frac{92}{100}$ of the population, whilst in the county of Lanark, with a population of 316,790, including 263,046 who live in towns, viz. in Glasgow 202,426, and in other towns 60,620, there was one such person for every $169\frac{71}{100}$, showing a degree of health in the population of Glasgow nearly equal to that of the whole of Scotland.

The following results have reference to Glasgow and its suburbs, which partake of a mercantile and manufacturing population, or something between Liverpool and Manchester, the town population being 198,518, and the rural 3908: In 1831 the population was found to be 202,426, the burials 5185, and the rate of mortality consequently $39\frac{4}{100}$. The births being 6868, there is one birth for every $29\frac{47}{100}$ persons. The number of marriages being 1919, there is $3\frac{57}{100}$ births to each marriage, and one marriage for every $105\frac{48}{100}$ persons. The number of families being 41,965, there are $4\frac{82}{100}$ persons to each family. It is very satisfactory to know, that with the same machinery in 1821, the population being 147,043, the burials 3686, the rate of mortality was $39\frac{89}{100}$, or, in other words, as near as may be to the mortality in 1831. By reference to the bills of mortality between the years 1821 and 1831, similar results will be obtained. Dr Cleland states, that in all the authentic bills of mortality he had ever seen, there were more males born than females; but taking the population above fifteen years, the number of females preponderates. The following results for Glasgow are derived from the census of 1831.

Births—Males....................3,527	Females.............3,341	Excess of males.............186
Males under five years........15,422	Females...........14,855	Excess of males.............567
Males under ten years.........28,549	Females...........27,435	Excess of males...........1,114
Males under fifteen years.....39,040	Females...........38,155	Excess of males.............885
Males under twenty years...47,529	Females...........50,411	Excess of females.........2,882
Males under thirty years......62,706	Females...........73,419	Excess of females.......10,713
Males—entire population.....93,724	Females..........108,702	Excess of females.......14,978
Burials—Males...................2,701	Females.............2,484	Excess of males.............217

Description of householders:—Married men, 30,032; idowers, 1790; bachelors, 1437; male householders, 3,259: Widows, 6824; spinsters, 1882; female house-lders, 8706: Total families, 41,965. Country to which e population belongs: Scotch, 163,600; English, 2919; ish, 35,554; foreigners, 353; total, 202,426. Religion f the population: Established, 104,162; Dissenters, Epis-palians, and Jews, 71,299; Roman Catholics, 26,965; tal, 202,426.

It appears from a recent report of a committee of the House of Commons, on the evidence of persons distinguished by their knowledge in political science, such as Dr Bowring, Dr Burrows, Mr Grimaldi, and others, that the public registers in this country are so inefficient as to render it impossible to determine the law of mortality among the working classes of the empire, either generally or locally. Mr Wheeler, clerk to the company of parish clerks, stated that in London the returns for the mortality bill are made up in each parish by two *old pauper women*, who are utterly incompetent to give correct information, and frequently receive most fallacious reports; and Mr Finlaison, the government actuary, stated that no faith whatever could be put in bills of mortality as they are now prepared. In order to procure an approximation of the rate of mortality which prevails among the working classes in this country, that distinguished political inquirer resorted to the public registers at Ostend in Flanders, where he made an observation on the mortality of that town for a period of twenty-six years ending in 1832. The result of his investigations was, that in a population consisting of about 11,000 souls, the rate of mortality was as one in thirty-six and one eighth. Mr Finlaison stated, in evidence, that "he was enabled to determine that Ostend is (notwithstanding the opinion that prevails in England) a very healthy situation, and no doubt is equal to the average of England; at least the only knowledge of the law of mortality as prevailing among the lower orders in England, on which he was able to depend, is derived from that which he obtained in Flanders." Thus it appears that the law of mortality in England is derived from data of about 11,000 souls in a foreign country, whilst the mortality of Glasgow is ascertained from a population of upwards of 200,000 souls; and as to the principles upon which the amount of mortality is ascertained, Mr Milne, the celebrated political inquirer, and actuary to the Sun Life Office, London, stated as his opinion, in reference to the Glasgow bills published by Dr Cleland in 1831, that "the law of mortality in a large manufacturing town may now be determined, though it could not heretofore, for want of the necessary data." Glasgow may, therefore, fairly claim precedence in whatever relates to the probability of human life in large manufacturing towns.

University.—The University of Glasgow is a corporate body, consisting of a chancellor, rector, dean, and principal, with professors and students. It was originally founded, like most other establishments of the same nature, by authority of the see of Rome. Pope Nicolas V. by a bull dated the 7th of January 1451, erected and established it.

The university at this time had received no endowments, and was for years possessed of no property except the university purse, into which were put some small perquisites on conferring degrees, and the patronages of two or three small chaplainaries. At first the university had no buildings of its own. It held its meetings in the chapter-house of the Blackfriars, or in the cathedral. But these defects were in some measure supplied by the liberality of James, first Lord Hamilton, an ancestor of the noble house of Hamilton, who, in the year 1459, gave to the principal and other regents of the College of Arts, for their use and accommodation, a tenement, with its pertinents, in the High Street of Glasgow, to the north of the Blackfriars, together with four acres of land in the Dow-hill. In the deed the noble donor required the principal and regents, on their first admission, to declare on oath that they would commemorate James Lord Hamilton, and Lady Euphemia, his spouse, the Countess of Douglas, as the founders of the college. Amongst other benefactors of the college distinguished by their donations chiefly for the support of poor students, were Ann duchess of Hamilton, Robina countess of Forfar, William earl of Dundonnell, the Duke of Chandos, the Duke of Montrose, Leighton archbishop of Glasgow, Boulter bishop of Armagh, Mr Snell, Dr Williams, Dr Walton, Mr Zachary Boyd, and Dr William Hunter.

The Reformation produced great disorder in the university, its members being clergymen of the Catholic persuasion, and its chief support being derived from the church. In 1577 James VI. prescribed particular rules with regard to the college, and the formation of its government, and made a considerable addition to its funds. The charter by which the king made these regulations, and gave that property, still continues to be the magna charta of the college, and is known by the name of *Nova Erectio*.

The business of the university is transacted in three distinct meetings, viz. those of the senate, the *comitia*, and the faculty. The meeting of senate consists of the rector, the dean, the members of faculty, and the other professors. The rector presides in this meeting, except when affairs are managed for which the dean is competent. Meetings of the senate are held for the election and admission of the chancellor and dean of faculty, for the admission of the vice-chancellor and vice-rector, for electing a representative to the general assembly, for conferring degrees, and for the management of the libraries and other matters belonging to the university. The constituent members of the *comitia* are the rector, the dean, the principal, the professors, and the matriculated students of the university. The rector or vice-rector presides in this meeting. Meetings of the comitia are held for the election and admission of the rector, for hearing public disputations in any of the faculties previously to the conferring of degrees, for hearing the inaugural discourses of the principal and professors previously to their admission to their respective offices, and for promulgating the laws of the university, and other acts of the university and college courts. The meeting of faculty, or college meeting, consists of the principal, the professors of divinity, church history, oriental languages, natural philosophy, moral philosophy, mathematics, logic, Greek, humanity, civil law, medicine, anatomy, and practical astronomy. The principal presides in this meeting, and has a *casting*, but not a *deliberative* vote. The members of faculty have the administration of the whole revenue and property of the college, consisting of heritage, feus, teinds, and bequests, with the exception of a few particular bequests, in which the rector and other officers of the university are specially named. They have likewise the right of exercising the patronage of eight professorships vested in the college. They present a minister to the parish of Govan, and have the gift of various bursaries. In the exercise however of one of their privileges, viz. the election of professors, the rector and dean of faculty have a vote.

The officer of highest dignity in the university is the *chancellor*, who is elected by the members of senate. He is the head of the university, and by himself or his deputy has the sole privilege of conferring academical degrees upon persons found qualified by the Senatus Academicus. The office of chancellor is held during life. The *rector* is annually elected by the dean, the principal, the professors, and the matriculated students. The electors are divided, according to their respective birthplaces, into four nations; Glottianna, Transforthana, Loudoniana, and Rothseana. As the majority of the members of each nation constitutes one vote, in case of an equality, the rector going out of office has the casting vote; and, in his absence, the rector immediately preceding. The election is always held on the 15th of November, except when it falls upon Sunday, and then the election is held on the following day, and the same person is generally re-elected for a second year. It is the duty of the rector to preserve the rights and privileges of the university, to convoke those meetings in which he presides, and, with his assessors, whom he himself appoints, to exercise that academical jurisdiction amongst the students themselves, or between the students and citizens, which is bestowed upon most of the universities of Europe. The *dean of faculties* is elected by the senate. This office is held for two years, and by virtue of it he is entitled to give directions with regard to the course of study, and to judge, together with the rector, principal, and professors, of the qualifications of those who desire to be created masters of arts, doctors of divinity, &c. The foundation of the office of *principal*, almost coeval with that of the university, was onfirmed by James VI. in 1577. It is in the appointment the king. The principal has the ordinary superinten- nce of the deportment of all members of the university, d is *primarius* professor of divinity. The *professors* of e university of Glasgow may be distributed, according to e departments of knowledge to which they are respec- vely assigned, into four distinct faculties, those of arts, eology, law, and medicine.

The faculty of arts comprehends the professors of Latin humanity, Greek, logic, ethics, natural philosophy, ma- ematics, practical astronomy, and natural history. To is faculty may be added the professors of mathematics, tronomy, and natural history. The faculty of theology cludes, besides the principal, who in right of his office first professor of divinity, three other professorships, ose of divinity, church history, and oriental languages. he faculty of law consists of a single professorship, that of vil law. The faculty of medicine comprehends the pro- ssorships of anatomy, medicine, materia medica, surgery, idwifery, chemistry, and botany. The professors of Greek, gic, ethics, and natural philosophy, whose chairs were the rliest endowed in the university, are denominated regents, nd enjoy, in right of their regency, certain trifling privi- ges beyond their brother professors. The regius pro- ssors are those whose chairs have been recently founded, dowed, and nominated by the crown, and they are mem- rs of senate only, not of the faculty of college, viz. natu- l history, surgery, midwifery, chemistry, botany, and ma- ria medica.

The university library was founded in the fifteenth cen- ry. It contains an extensive and valuable collection of oks, amongst which are many beautiful editions of the assics. It is always increasing by donations of copies every new work published in this country, as well as by oks purchased by the fees received at matriculation, as- sted by fees received from graduates, and by an annual yment from all students, who are entitled to the use of e library under certain limitations.

A small botanic garden adjoining the college was prepar- d for the use of the lecturer in botany in 1753; but hav- ng from various causes become unfit for its purposes, a ery valuable botanical garden, consisting of eight acres, as formed in the neighbourhood of the city by the citi- ens of Glasgow. The university subscribed L.2000 to- ards its erection, for the privilege of their professor of otany lecturing in the hall in the garden, and government as subsequently given a similar sum in support of it. This garden, which was opened in the spring of 1818, for e variety of rare plants from almost every part of the orld, is not exceeded by any botanical garden in the ingdom.

The founder of the Hunterian museum was the celebrat- d William Hunter, who was born in the parish of East Kil- ride, in the neighbourhood of Glasgow, in 1710. By his ill in 1781, he bequeathed to the principal and professors f the college his splendid collection of books, coins, paint- ngs, anatomical preparations, &c. and appropriated L.8000 r the erection of a building for their reception. The col- ection is valued at L.65,000, viz. medals L.30,000, books .15,000, pictures L.10,000, miscellaneous L.10,000. The ollection has been considerably increased of late years. The public are admitted every lawful day, on payment of ne shilling.

There are twenty-seven bursaries connected with the ollege, varying from L.5 to L.40. They are held from our to six years. Besides these there are two very valu- ble exhibitions. In the year 1688, Mr John Snell, with view to support episcopacy in Scotland, devised to trus- ees a considerable estate near Leamington, in Warwick- hire, for educating Scotch students at Baliol College, Ox- ord. By the rise in the value of land, and the improvements which have from time to time been made on that estate, the fund now affords about L.130 per annum to each of ten exhibitioners. Another foundation by John Warner, bishop of Rochester, of L.20 per annum to each of four Scotch students of the same college during their residence at Oxford, is generally given to the Glasgow exhibitioners, so that four of them have a stipend of L.150 per annum. The exhibitions are tenable for ten years, but vacated by marriage, or on receiving preferment of a certain amount. The right of nomination belongs to the principal and professors of the faculty.

Candidates to be eligible to Snell's exhibitions must, first, be natives of Scotland, which the master of Baliol requires to be proved by the production of an extract from the parish register of births; secondly, they must have attended as public students at least two sessions at the university of Glasgow, or one session there and two at some other Scottish university; and, thirdly, they must not be graduates of any university. Warner's exhibitions are in the gift of the Archbishop of Canterbury and Bishop of Rochester, who usually nominate on the recommendation of the master of Baliol College. Amongst the distinguished persons of several professions who have been educated on Mr Snell's foundation, may be mentioned, Dr John Douglas, bishop of Salisbury, Dr Adam Smith, and Dr Matthew Baillie.

This university has had from its origin men of the highest talent and literary eminence among its professors and office bearers. The names of Melville, Baillie, Leishman, Burnet, Simpson, Hutchison, Black, Cullen, Adam Smith, Reid, Miller, and Richardson, are conspicuous; and the names of Henry Dundas, Edmund Burke, and other distinguished individuals, are to be found in the list of rectors.

Grammar-School.—This seminary is of remote antiquity, but, like some similar institutions of long standing, little is known of its early history. There was a grammar-school at Glasgow in the early part of the fourteenth century. It depended immediately on the cathedral church, and the chancellor of the diocese had not only the appointment of the masters, but also the superintendence of whatever related to education in the city. The grammar-school continued to be a distinct establishment after the erection of the university, and considerable care appears to have been taken to supply it with good teachers. In 1494 Mr Martin Wan, chancellor of the metropolitan church of Glasgow, brought a complaint before Bishop Blackadder against one Dwne, a priest of the diocese, for teaching scholars in grammar, and children in inferior branches, by himself apart, openly and publicly in the said city, without the allowance and in opposition to the will of the chancellor. The bishop, having heard parties, and examined witnesses, decided, with the advice of his chapter, and of the rector and clerks of the university, in favour of the chancellor. In the sixteenth century the situation of the master of the grammar-school was highly respectable; he was to be found among the *non-regentes* nominated to elect the rector and to examine the graduates. On the 28th of October 1595 the presbytery directed the regents in the college "to try the Irish scholars in the grammar school, twitching the heads of religion." At that period the school met at five o'clock in the morning. On 26th March 1601 the session decided that the school-house in the Greyfriars Wynd was in a ruinous state, and directed it to be rebuilt. Mr John Blackburn, who was master of the grammar-school and lord rector of the university in 1592–1593, resigned his mastership in 1615, on being appointed minister of the Barony Church.

The records of the town council have been searched in vain for the plan or system by which the school was conducted prior to the year 1707. Since that period it has undergone various changes in the management and system of education. Sometimes the school was under the control of a rector, and at other times the office was laid aside. Sometimes the office during the course consisted of five, and at others of only four years. In 1830 the office of rector was abolished, and each of the four masters had the entire charge of finishing his own scholars during the four years. But in 1834 this seminary underwent a material alteration. From being a grammar-school, it may now be considered as an academy. Two of the masterships for Latin and Greek have been suppressed, and in lieu of these, teachers of English grammar, elocution, French, Italian, German, writing, arithmetic, geography, and mathematics, have been introduced, and the name of the seminary has been changed to that of the High School. The school is under the immediate management of a committee of the town council, aided by the advice and assistance of the clergy of the city, and by the professors of the university.

Anderson's University.—This establishment, founded by Mr John Anderson, professor of natural philosophy in the university of Glasgow, on the 7th of May 1795, and endowed by him with a valuable philosophical apparatus, museum, and library, was incorporated by a seal of cause from the magistrates and council of this city on the 9th of June 1796. The university is subject to the inspection of the Lord Provost, and other official persons, as ordinary visitors, and is placed under the immediate superintendence of eighty-one trustees, who are elected by ballot, and remain in office for life, unless disqualified by non-attendance. The trustees consist of nine classes of citizens, viz. tradesmen, agriculturists, artists, manufacturers, physicians and surgeons, lawyers, divines, philosophers, and, lastly, kinsmen or namesakes. The trustees elect annually by ballot nine of their number as managers, to whom the principal affairs of the institution are intrusted during the year. The managers elect by ballot from their number, the president, secretary, and treasurer. Although the views of the venerable and celebrated founder embraced a complete circle of liberal education, adapted to the improved state of society, it was found convenient at first to limit the plan to natural philosophy, chemistry, mathematics, and geography.

The business of the university commenced on the 21st of September 1796, by Dr Garnet's reading, in the trades' hall, to persons of both sexes, popular and scientific lectures on natural philosophy and chemistry, illustrated by experiments. Soon after this period the managers rented, and then purchased, extensive premises in John Street. Dr Garnet having been appointed professor of experimental philosophy and chemistry in the Royal Institution of London, which had been formed on the model of this primary one, resigned his professorship; and on the 18th of October 1799, Dr George Birkbeck was appointed as his successor. In addition to what had been formerly taught, he introduced a familiar system of instruction, which he demonstrated by experiments, free of expense. Dr William Anderson and Dr James Cleland recommended about 500 operatives to this class. This mode of tuition, by which philosophical subjects are explained in ordinary language, divested of technicalities beyond the comprehension of the students, is continued with great success, at a small expense, and has been productive of the happiest effects on a valuable class of society. Dr Birkbeck resigned his professorship on the 5th of August 1804, and returned to London. Dr Andrew Ure was appointed his successor on the 21st of the following month; and during a period of twenty-five years discharged the duties of his office with great ability, when he also went to London to reside.

The affairs of the university becoming more and more prosperous, the trustees purchased from the city the grammar-school buildings in George Street; and having made considerable additions and alterations, the premises now contain numerous halls for the professors, and for the museum, which has of late become very rich in its several departments. The university buildings were opened in November 1828, since which time the classes have been well attended, and *soirées* have been introduced with the happiest effect. The subjects professed in 1834, were, first, literature, philosophy and popular science, natural philosophy, logic, ethics, rhetoric, mathematics, natural history, modern languages, oriental languages, drawing and painting in oil and colours, and popular lectures on the veterinary art; and, secondly, surgery, chemistry, medical jurisprudence, theory of medicine, anatomy, physiology, and midwifery.

Mechanics' Institution for the Promotion of the Arts and Sciences.—This society was formed, in 1823, by the mechanics of Glasgow, with the view of disseminating mechanical and scientific knowledge among their fellow operatives, particularly those branches more immediately connected with their daily occupations. Lectures were given on natural philosophy and chemistry, when a fee of three shillings was paid by each student, which was afterwards increased to ten shillings. From the formation of the society to the present time the number of students have averaged yearly about 500. Free admission is annually given to the lectures on chemistry and mechanics, and also to the library, to poor apprentices, one being admitted for every twenty tickets sold. In this manner 220 have been admitted since the commencement of the institution. In 1831 the society removed to large premises built for them in Hanover Street. A colossal statue of James Watt is placed on the pediment of the building, by a subscription of one shilling from each student in successive years. In the building there are commodious apartments for the numerous models and apparatus, and the library, which now consists of 3030 volumes on science and general literature. In the session of 1834 there were three professors, who gave lectures on natural philosophy, chemistry, popular anatomy, physiology, and phrenology; the fee for the course being eight shillings.

Public Green.—There is probably no town of equal extent in the empire which can boast of such a park as the green of Glasgow, whether its extent (about 140 imperial acres), its use to the inhabitants, or its picturesque effect, be considered.

Mills.—The town's mills on the Molindinar Burn, erected about the middle of the fourteenth century, supplied from the Hogganfield and Frankfield Lochs, are not of so much use to the inhabitants as formerly, since steam-mills have been introduced. The water and steam-mills on the river Kelvin, at Partick and Clayslap, belonging to the corporation of bakers, are very extensive, and of a superior construction. The establishment contains a large steam-mill, seven water-wheels, twenty-two pairs of stones (Bordeaux burrs), six boultin, and three shealing-machines. The granaries and kilns are proportionate to the mills, which can grind 12,000 bushels of wheat weekly. The bakers got a grant of their old mill at Partick, from the Regent Murray, for their services at the battle of Langside, on 13th May 1568.

Markets.—The markets for meal, butcher-meat, fish, &c. have been much neglected of late. The great increase of the town has induced persons at a distance to resort to shops instead of markets. The live-cattle market is however entitled to particular notice. Prior to the year 1818 the principal butchers in this city were frequently obliged to travel a circuit of seventy or eighty miles to purchase cattle in lots, and to rent expensive parks in the neighbourhood of the city to graze them in; but since the erection of the live-cattle market the mode of supply is completely changed. In 1818 the magistrates fitted up a spacious market-place between the great roads to Edinburgh by Gallowgate and

Duke Street, in which there is a commodious inn, stables, sheds, a byre to contain 120 bullocks in view, and 260 pens to contain 9360 sheep. This market-place, said to be the most complete in the kingdom, occupies an area of 29,560 square yards, or rather more than six imperial acres, is paved with whinstones, and enclosed with stone walls. Since its formation, graziers and dealers from Aberdeenshire to Dumfriesshire, and from Berwickshire to Argyleshire, find it their interest to send their cattle to this market, where they find a ready sale, and return in cash. It is admitted that this market has been of great use to all classes of the community, excepting perhaps the more wealthy butchers. The dealers are benefited by a regular sale, without running the risk of bad debts. The public have a more regular and plentiful supply of butcher-meat of the best quality. The butcher is saved the trouble and the public the expense of travelling. The butcher of small capital, who formerly had not the means of getting good meat, can now go to market; and if his capital be equal to the purchase of a bullock and a dozen of sheep or lambs, he can compete with his more wealthy brethren. Monopoly is now unknown. The dues of the market are let by public sale at L.1075 per annum. Dr Cleland has the sole merit of projecting and completing this important establishment.

The sales in 1833 were 165,560 head of cattle, and sheep and lambs, viz. bullocks and cows 18,360, sheep and lambs 147,200, exclusively of calves and pigs. In 1822 a few rumps of beef were sent by the Edinburgh butchers to the Glasgow market; and this traffic has increased so much, that during 1833, 7210 rumps were sent to Glasgow, the average value of each rump being 20s. Messrs Allans alone purchased 6676 rumps. The advantages arising from this market has induced the Irish graziers to send cattle to it. On the 18th of December 1834, the Green Isle steamer arrived at Glasgow from Drogheda, loaded exclusively with cattle and pigs. This was the first cattle-carrying steamer that arrived in the Clyde. The traffic is to be continued.

Public Buildings.—In a work of this nature an architectural description of the public buildings in Glasgow would be superfluous; we shall therefore confine ourselves to merely mentioning a few of the most prominent of those appropriated for ecclesiastical purposes, and a few for the civil concerns of the city. For ecclesiastical, the first in order is the cathedral, which is allowed to be the most splendid edifice of old English architecture that is to be found in Scotland. Its length from east to west is 319 feet, width sixty-three feet, height of the nave ninety feet, and of the choir eighty-five feet. In this edifice there are 147 pillars, and 159 windows of various dimensions, many of them of exquisite workmanship. The crypt under the choir is not equalled for architectural effect in the kingdom. St Andrew's, St David's, and St Enoch's churches, and the Albion Street and George Street chapels belonging to the dissenters, are fine specimens of architecture. For civil purposes, the Royal Exchange is prominent. This building, from designs by Mr David Hamilton, a native of Glasgow, is remarkable both for its extent and its architectural decorations. The Hunterian Museum, from designs by Mr William Stark, is a beautiful model of a Greek temple. The Royal Infirmary and the Lunatic Asylum are at once ornamental, and appropriate for their respective purposes.

Streets and Squares.—The streets, with the exception of some of those in the old part of the town, are all sixty feet wide; and the houses are built of stone and covered with slate. There are four squares, viz. Blythwood's, George's, St Enoch's, and St Andrew's. The three former are planted with shrubbery, and St Andrew's Church stands in the centre of the latter.

Burying Grounds.—There are twenty burying grounds in the city and suburbs. The necropolis, formed by the merchants' house, in 1830, in their elevated park adjoining the cathedral, in imitation of the cemetery of Père la Chaise in Paris, stands unrivalled in the kingdom for picturesque effect.

Monuments and Statues.—Amongst others may be enumerated an equestrian statue of William III. erected at the Cross; an obelisk in honour of Lord Nelson, in the Green; a pedestrian statue of Sir John Moore, in bronze, on a granite pedestal, by Flaxman, in George Square; a pedestrian statue of William Pitt, in marble, by Flaxman, in the town-hall; a trophy monument in honour of Lieutenant-colonel Cadogan (71st or Glasgow regiment), in marble, by Hamilton, in the nave of the cathedral; a pillar surmounted by a statue in honour of John Knox, by Forrest, in the necropolis; a pedestrian statue of James Watt, in bronze, on a granite pedestal, in George Square, by Chauntry; also a pedestrian statue of James Watt, in marble, by Chauntry, in the Hunterian Museum; and an architectural monument, with a statue of William M'Gavin, by Forrest, in the necropolis.

Gaol and Court-Houses.—For a number of years previously to 1807, the gaol at the cross had become deficient in almost every requisite, situated in the centre of the city, without court-yards, chapel, or infirmary. It contained no more than thirty-two apartments for the accommodation of prisoners of every description, collected occasionally from the populous counties of Lanark, Renfrew, and Dumbarton, and invariably at the justiciary circuits, having very slender accommodation for the local courts of justice, whilst that for the circuit court of justiciary was quite inadequate. Impressed with the necessity of affording more suitable accommodation for the courts of justice, and more convenient and healthful apartments for prisoners, the magistrates and council, on the 13th of February 1807, resolved to erect a new gaol and public offices, in a healthy situation adjoining the river, at the bottom of the public green. This building, which cost L.34,800, contains, exclusively of the public offices, 122 apartments for prisoners. As there is a water-closet in each gallery, every individual prisoner, debtor and delinquent, has access to one of them, and to an unlimited supply of pure filtrated water from the water company's pipes; and pipes are introduced into each court, from which they are daily washed, and the air in them frequently cooled in hot weather. There are two rooms, with ante-rooms, insulated from the gaol, for persons under sentence of death, and so constructed that irons are never used. It is believed that this is the only prison in the kingdom where persons under sentence of death are not put in irons. Every room is provided with the necessary utensils at the expense of the corporation. There is a well-aired infirmary-room, though seldom or never used, from the healthiness of the prisoners; and the chapel is seated to contain about 200 persons. The governor's house is so constructed that from his sitting parlour he can overlook both court-yards. The justiciary hall is so spacious as to contain upwards of 500 persons. The number of incarcerations in the gaol for debt have of late years happily decreased, whilst the incarcerations for delinquency have been rather on the increase. The average number committed yearly during five years ending on the 31st of December 1833, was 667. From 1765 to 1830, eighty-nine persons were executed in Glasgow, of which number five were females. During the first twelve years there were only six persons executed, whilst in the last twelve there were thirty-seven. During sixty-six years previously to 1831, there were twenty-six in which there were no executions, fifteen in which there was one each year; ten, two; seven, three; four, four; one, five; and two in which there were six. From the 29th of September 1830, to the 20th of January 1834, twelve persons have been executed in Glasgow, viz. eleven males and one female, of whom six were for murder, one for rape, one for hamesucken, one for robbery, and three for housebreaking and theft. From the 4th of May 1818, to the 8th of October 1834, six persons received sentence of death, but had their punishment commuted to transportation for life, viz. four males and two females, of whom one for murder, one for hamesucken and rape, one for robbery, and one for housebreaking and theft; the two females for forged bank-notes.

Bridewell.—The Bridewell in Duke Street was opened on the 8th of May 1798, and supported by the corporation funds for upwards of twenty-four years. This building, which still remains, consists of six stories, and contains 105 cells. Although but ill suited for classification, it answered the purpose for a number of years; but, from the great increase of population, and consequently of crime, in the city and county, it was agreed that the new buildings should be so large as to contain the city and county prisoners, combining the improvements which experience have pointed out. The authorities having procured an act of parliament for assessing the city and county for building and maintaining a Bridewell, they erected a set of buildings so well suited for the purpose, as to be the admiration of all those who have made prisons and prison discipline their study. This prison, which adjoins the former one, was opened on the 25th of December 1824. It combines all the advantages of modern improvement, security, seclusion, complete classification, and healthful accommodation.

Abstract Accounts for the year ended the 2d August 1834.

To repairs on the buildings		L.156 10 0	
Salaries and wages		835 14 11	
			L.992 4 11
By amount of prisoners' labour, &c		L.2182 6 2	
To victuals, bedding, clothes, washing, medicine, coal, candle, furniture, machinery, utensils, stationery, &c	L.1664 6 0		
Cash paid prisoners for surplus earnings	116 5 3		
		1780 11 3	
Surplus to be deducted from salaries and wages			401 14 11
Balance, being the cost of Bridewell for the year ended 2d August 1834			L.590 10 0

Table showing the number of Prisoners, and the different periods of confinement.

Days.																
Periods of confinement	2	4	5	7	8	10	14	15	20	21	30	35	40	42	50	60
Number of prisoners	1	1	2	5	3	11	46	7	26	8	349	7	3	17	3	1114

Months.											Convicts and untried Prisoners.	Males.	Females.	Total.
Periods of confinement	3	4	6	8	9	10	12	15	18	24				
Number of prisoners	25	12	69	5	3	1	25	1	6	1	216	1035	932	1967

The average period of confinement according to sentence is sixty-three and a half days; according to residence in the house, fifty-nine and a half days.

The greatest number at one time confined was on the 12th of November 1833, viz. 372, males 199, females 173. Smallest number at one time, 27th February 1834, 231, viz. males 123, females 108. Average number daily in the house 320, viz. males 162, females 158.

Males above seventeen years of age	813	
Males below seventeen years of age	222	
		1035
Females above seventeen years of age	864	
Females below seventeen years of age	68	
		932
Total commitments		1967
Remained on 2d August 1833		356
Prisoners in all		2323
Liberated during the year		2030
Remaining on the 2d of August 1834		293

It appears from the above statement, that besides the sum of L.116. 5s. 3d. paid to inmates, the produce of the work performed maintained all the prisoners, with a surplus of L.401. 14s. 11d., which surplus goes to lessen the expense of repairs on the buildings, and the salaries and wages. The whole deficiency, amounting to L.590. 10s., divided by 1967, the number committed, shows that the net expense to the public for every committal is no more than 6s., the average period of residence being fifty-nine and a half days. Taking another view, the deficiency of L.590. 10s., when applied to 320, the daily average of inmates, shows the expense of each prisoner to be L.1. 16s. 11d. per annum, 2s. 10d. per month, or about 8½d. weekly. This establishment, so creditable to the city and county, is conspicuous for the economy with which it is managed.

Police.—Till the appointment of a statutory police in 1800, the citizens of Glasgow performed the duties of watching and warding. The buildings in Albion Street are very extensive, and were the first in Scotland erected for the exclusive purpose of police.

Of the concerns of the establishment, which is placed under the management of the magistrates, and one commissioner for each ward chosen by the rate payers, the following is an abstract for 1834: Disbursements, L.15,033. 13s. 6½d. The receipts arise from one shilling per pound on rents exceeding L.15, and on lower rents proportionally. Besides the superintendent, collector, clerk, surveyor, and surgeon, there are eight heads of departments, three lieutenants, fifty-eight officers, 135 night watchmen, eight coal weighers, twenty-one lamp-lighters, fifty firemen, and twenty supernumeraries; in all, 308 persons on the establishment. There are 2050 gas lamps with single jets, and forty-seven with three jets; in all, 2097 lamps. Of this number between 800 and 900 are taken down in the summer months.

Theatre.—Previously to the Reformation, and for some time afterwards, pantomime representations of the history of our Saviour, his miracles and passion, were exhibited in the city. It does not appear that any theatrical representation was allowed in this city from the Reformation in 1560 till 1750. At the latter period Mr Burrell's dancing hall in the High Street was used for that purpose, being for years after the theatre in the Canongate of Edinburgh was opened, which was the first regular theatre in Scotland after the Reformation. In 1752, a booth or temporary theatre was fitted up adjoining the wall of the archbishop's palace, in which Digges, Love, Stampier, and Mrs Ward performed. Messrs Jackson, Love, and Bete, comedians, built a regular theatre in the Grahamston suburb, which was opened in the spring of 1764 by Mr Bellamy and other respectable performers. On the first night of performance, the machinery and scenery were set on fire by some disorderly persons. When the stage was refitted, the theatre was occasionally kept open, but with very indifferent success; and at one o'clock on the morning of the 16th April 1782 it was burned to the ground. There was no theatre in Glasgow from this period till January 1785, when the Dunlop Street Theatre, erected by Mr Jackson, was opened by Mrs Siddons, Mrs Jordan, and other performers. From this period the taste for theatricals increased so much, that a subscription was set on foot for a theatre upon a large scale; and on the 24th of April 1805 the most magnificent provincial theatre in the empire was opened in Queen Street, at an expense of L.18,500. It was let on lease for L.1200 per annum; but it was soon found that the taste for theatricals did not keep pace with the sums laid out for accommodation and splendour. The premises were then let at the reduced rent of L.800 to others, who also failed to implement their engagement; and even when the rent was lowered to L.400, it was paid with difficulty. The property was then sold at a price only equal to the outstanding debts and ground rent; so that the shareholders got nothing. This splendid edifice was burned to the ground on the forenoon of the 10th of January 1829, a gas-light having come in contact with the ceiling of one of the lobbies leading to the upper gallery. After this catastrophe the old theatre in Dunlop Street was enlarged and embellished by Mr Alexander, and is found to be quite large enough for the play-going people of Glasgow and neighbourhood.

Rise and Progress of the State of Society.—Prior to the Reformation in 1560 the inhabitants of Glasgow were in a state of abject ignorance and superstition, and so disorderly, that even the ministers of religion found it necessary to wear arms in the pulpit. For about a century after the Reformation the people were very poor, and the accommodation in their houses bad. Prior to the famous meeting of the general assembly of the church, held in Glasgow in 1638, when the struggle took place as to whether the episcopal or the presbyterian form of religion should obtain in the church, the magistrates sent to Flanders for a hundred muskets, thirty pikes, four cwts. of powder, the same quantity of match, and ordered a conscription of a hundred young men to be drilled for the approaching meeting; and intestine feuds were so prevalent that weaponschawing was strictly enforced. At this period the circulating medium seems to have been exceedingly scarce, as Provost Stewart sent two men through the town to collect what silver things they could find, to be sent to Edinburgh in support of the struggle. On the 1[illegible]th of March 1698 the magistrates of Glasgow granted an allowance to the jailor for keeping warlocks and witches imprisoned in the tolbooth, by order of the lords commissioners of justiciary. During the failure of the crops in 1799 and 1800, a number of the citizens of Glasgow purchased L.117,500 worth of grain, and sold it at low rates to the poor, at a loss of L.15,000. In 1816, during a stagnation of trade, a subscription of L.9653 was divided among 2[illegible]30 persons. In 1818, L.6626 was subscribed for the relief of persons afflicted with typhus fever. In 1819 large sums were raised for those who could not find employment; on that occasion 2040 heads of families, who never pawned before, were under the necessity of doing so, and articles were pawned to the number of 7380.

In 1712 the population was 13,832; in 1831, 202,426. In 1712, the rental amounted to L.7840; in 1831, in the royalty, without the suburbs, to L.319,372. In 1712 there were only 202 shops, at from L.5 to 10s.; in 1831, 3184 shops, at from about L.250 to about L.5. In 1740 the dwelling-houses of the higher classes of citizens contained only one public room, a dining-room, and even that was only used when they had company, the family at other times eating in a bed-room. Entertainments were few and simple; and the dinner hour was one o'clock. The husband went to his business after dinner, and the wife gave tea at four o'clock to her female friends. Shopkeepers locked their shops during the breakfast and dinner hours. At this period the people were in general religious, and particularly strict in the observance of the Sabbath; some of them, indeed, to an extent that was considered by others extravagant and fanatical. There were families who did not sweep or dust their houses, did not make the beds, nor allow any food to be dressed, on Sundays. The magistrates employed what they called *compurgators*, to perambulate the streets during divine service, and seize all persons whom they found strolling about. At this period the houses, with few exceptions, were covered with thatch. Entertainments are now given more frequently, and the mode of giving them is materially changed. The value of the table service, and the style of the furniture, in the houses of a great number of the Glasgow merchants, are inferior to none in the land.

Previously to the opening of the tontine coffee-room, it was usual to transact business in public houses, over a mixture of whisky and small beer, called pap-in. The opening of the tontine coffee-room in 1781 set aside this pernicious tippling practice, and tended greatly to abolish the distinction of rank in mercantile concerns. For some time after the coffee-room was opened there were but few subscribers at 21s. On the 10th of December 1834 the subscribers in this room amounted to 545, at 25s. admission money. In 1825 the western club was opened; there are now 280 members. The entrance money is L.21, and the annual subscription L.5. 5s. The members are admitted by ballot. The Royal Exchange Coffee-room in Queen Street was opened on the 6th of September 1830. There are now 1264 subscribers, at an annual subscription of 42s.; so that, independently of those who use the minor reading rooms, there were in 1834, 2089 persons in Glasgow who frequented the above rooms.

Until 1776 there were no foot pavements in the city; but in that year a foot pavement was made at the south-east end of Candlerigg Street. There are now upwards of a hundred miles of foot pavements in the city. At the autumn circuits of 1779, 1782, and 1796, there were no criminal business at the Glasgow circuit courts. At the spring circuit of 1828, 115 persons were accused of crimes, of whom 83 were convicted. In 1781 the revenue of the Glasgow Post-Office amounted to L.4341. 4s. 9d.; in 1833, to L.36,481. In 1785 the public markets and a few shops were the only places where the inhabitants could be supplied with necessaries. Now the markets are nearly deserted; butcher-meat is chiefly sold in shops, and numerous haberdashers and drapers occupy warehouses instead of shops. With the exception of Hutcheson's Hospital, the Town's Hospital, the Merchants' and Trades' Houses, the fourteen incorporated trades, and a few benefit societies, the numerous charitable and benevolent institutions of Glasgow have all originated during the last forty years, as is elsewhere shown. The first common sewer in Glasgow was made in 1790. There are now in forty-five streets rather more than seven miles of sewers. In 1792 the first steam-engine for spinning cotton was erected in Glasgow.

Prior to 1804 the city was scantily supplied by twenty-nine public and a few private wells. In 1806 the Glasgow Water Company was incorporated, and in 1808 the Cranston Hill Company. From their commencement till 31st May 1830, the companies had laid out L.320,244. 10s. 1d. on their works, which are now considerably extended. In 1831 there were 38,237 renters of water in the city and suburbs. Rates for 1834,—Houses rented under L.4, 5s. per annum; ditto L.4 and under L.5, and not above L.6, 7s. 6d.; all above L.6, 6¼ per cent., or 1s. 3d. per pound on rental. Public works; high service, *i. e.* in the more elevated parts of the city, L.12. 10s. for 1000 gallons per day; low service, L.6 ditto; workmen for drinking, 6d. per head; founderies, 1s. per man; lowest charge for a public work, L.4; counting-houses, 5s. to 10s. 6d.; water-closets in ditto, 5s. to 10s. 6d.; horses, 4s.; cows, 3s.

Bridges.—Bridges are a sort of edifices very difficult to execute, on account of the inconvenience of laying foundations and walling under water. There are three stone bridges and one timber bridge over the Clyde at Glasgow.

The original timber bridge over the Clyde having gone into decay about 1340, Bishop Rae built a stone bridge at Stockwell Street in 1345. The bridge was originally twelve feet wide, and consisted of eight arches. In 1777 an addition of ten feet was made to its breadth, and two of the northmost arches were built up for the purpose of confining the river within narrower bounds. The communication between the city and the south-west parts of Scotland for more than four hundred years was by this bridge. In 1820 and 1821 it was greatly improved by the formation of footpaths suspended on very tasteful iron framings. The bridge, as it now stands, is 415 feet long and thirty-four wide within the railing.

The foundation stone of Jamaica Street bridge was laid on the 29th of September 1768, by the Right Worshipful Provost George Murdoch, acting provincial grand master mason for Glasgow. The bridge had seven arches, was thirty feet wide within the parapets, and five hundred feet in length. The design was given by Mr William Mylne, architect in Edinburgh, and was executed by Mr John Adam.

The foundation stone of Hutcheson's bridge was laid in 1794, by Provost Gilbert Hamilton, near the foot of the Saltmarket, to connect the lands of Hutchesontown with the city. It had five arches, was 406 feet long and twenty-six feet wide within the parapets. On the 18th of November 1795, during an uncommonly high flood in the river, it was unfortunately swept away, after the parapets were nearly completed. The foundation stone of a new bridge was laid on the 18th of August 1829, by the Right Worshipful Robert Dalglish, substitute grand master mason for Glasgow, and preceptor of the hospital. This bridge is built on the site of the former one, from a design by Mr Robert Stevenson, civil engineer; it is thirty-six feet wide within the parapets, and 406 feet long, and has five arches. Mr John Steedman was contractor.

The Jamaica Street Bridge, although considered elegant and spacious for the time when it was built, had a very inconvenient ascent. The trustees therefore resolved to take it down.

The timber bridge at Portland Street is thirty feet wide within the railing, has a carriage-way and two side pavements. It was designed by Mr Robert Stevenson, and executed by Mr William Robertson in 1832.

The increase of trade and population in the city and adjacent districts having been such as to render the Jamaica Street or Broomielaw Bridge unfit for its purposes, the trustees therefore resolved to remove it, and to erect in its stead a bridge which would afford more suitable accommodation, such as the increasing population of the neighbouring districts required. Having obtained an act of parliament, they procured a design from Mr Thomas Telford, civil engineer, and contracted with Messrs John Gibb and Son for building the bridge. It is to be faced with Aberdeen granite, and to have a very gentle acclivity; it is to be 560 feet long over the newals, to have seven arches, and to be sixty feet wide over the parapets, which is wider than any river bridge in the kingdom. Dr James Cleland, umpire between the trustees and the contractors, laid the first stone of the bridge in the south abutment, eighteen feet below high-water mark, on the 8th of July 1833.

Banks.—The Bank of Scotland was established by charter in Edinburgh in 1695, and the following year in Glasgow, but was recalled for want of business in 1697. In 1731 it was again established in Glasgow, and recalled in 1733 from a similar cause. In 1749, the Ship Bank commenced business. This was the first bank belonging to the city; and till lately it was called the Old Bank. Since 1749, a number of banks have been established in Glasgow. The Glasgow Arms Bank commenced business about the year 1753, the Thistle Bank in 1761, and the Glasgow Merchants' Bank and Messrs Watsons' and Thomson's banking houses were formed shortly afterwards. The Royal Bank of Scotland, which was established by charter in Edinburgh in 1727, sent a branch to Glasgow in 1783. The Glasgow Banking Company commenced operations in 1809, the Glasgow Union Banking Company in 1830, and the Western Bank in 1832. These banks, with the exception of the Arms, Merchants', Thomson's, and Watsons', still continue to do business in Glasgow. There are also in Glasgow a branch of the British Linen chartered bank, and fourteen branches from provincial banks.

Provident Bank.—A provident or savings bank was opened in Glasgow on the 3d of July 1815, wherein deposits of one shilling and upwards are received, bearing interest at the rate of two and a half per cent. when the sum amounts to 12s. 8d. and has lain one month in the bank. The following is a statement of the concerns of the bank for 1833. It is open every day for deposits, and twice a week for payments.

Amount of open accounts at the end of the year	L.39,861	4	0
Received from depositors, exclusive of interest allowed during the year	30,767	3	0
Repaid to depositors, including interest during dotto	30,462	11	7
Interest allowed to depositors during ditto.	964	11	10
From the opening of the bank on 3d July 1815, to the end of the year 1833, number of accounts opened 24,039.			
Amount of interest paid to depositors from opening of the bank to the end of year 1833	10,662	18	0
At the end of the year 1833 open accounts under L.5	1,380	0	0

It is very gratifying to know, that during eighteen years the working classes in Glasgow have so managed their savings as to entitle them to L.10,662. 18s. interest, which, but for this institution, might have been laid out for purposes quite unavailing in the hour of need.

Post-Office.—The arrangements of this office are not surpassed, if indeed equalled, by any out of London. In 1806, when Mr Bannatyne was appointed post-master, the establishment consisted of a post-master, three clerks, a stamper, and six letter-carriers; and there were four penny-post-offices attached to it for the delivery and receipt of letters in the neighbouring district. Receiving-houses in the town for letters to be taken to the post-office had been tried, and had been given up on finding that they were not used. There were two deliveries of letters made daily to every part of the town and suburbs. The Glasgow establishment now (December 1834) consists of a post-master, ten clerks, two stampers, a superintendent of letter-carriers, and nineteen letter-carriers; and there are twenty-six penny-post-offices and nine sub-offices attached to it for the correspondence of the surrounding district. It has twelve receiving-houses distributed in the different parts of the town, the letters put into which are carried to the post-office, to be made up in the separate lines of mails as they are successively dispatched. There are four complete deliveries of letters now made daily to every part of the town and suburbs; and an answer may be received the same day to a penny-post letter put into the office, or a receiving-house, in time to be sent out with either of the two first deliveries.

Post-Office Revenue of Glasgow at the following dates.[1]

In 1781...	L.4,341	4	9	In 1830...	L34,978	9	0½
1810...	27,598	6	0	1831......	35,642	19	5
1815...	34,784	16	0	1832......	36,053	0	0
1820...	31,533	2	3	1833......	36,481	0	0
1825...	34,190	1	7				

The number of penny-post letters for Glasgow delivery, exclusively of those delivered through the twenty-six out penny offices, was, from October 1833 to October 1834, 12,491, and the amount of the revenue derived from them L.102. 0s. 11d. When it is considered that in 1833 the revenue was only L.1700 more than in 1815, whilst the population had increased in the same period upwards of 72,000, and the increase of correspondence in a still greater ratio, we are led to believe that the revenue is greatly defrauded by private carrying.

Rental and Stamps.—The rental of the city and suburbs in 1833 was L.539,466. Amount of stamps sold in 1828, L.91,213; in 1830, L.103,802; in 1834, L.110,930.

Education.—The attention which has been paid to education in Scotland for centuries past has been acknowledged all over Europe. Amidst all the tumult and violence of civil contention, and at a time when the very existence of the Presbyterian church was at stake, the subject of education and of schools was never overlooked.

By act 43 Geo. III. cap. 54, the salaries of parochial schoolmasters, whose schools are not entirely confined in royal burghs, are to be fixed, from and after the 11th September 1803, at a sum of from 300 to 400 merks Scots, by the minister, and the heritors whose lands in the parish amount to L.100 Scots. In twenty-five years after the above period, or such after period as the salary shall be fixed, these heritors and minister are to modify a new salary, according to the average price of oatmeal, to be ascertained by the exchequer, of the value of from one and a half to two chalders, and so on from twenty-five years to twenty-five years; and when there is not a proper school-house, a house for the schoolmaster, and a garden for him containing at least one fourth of a Scotch acre, the heritors of the parish must provide these.

Schools.—In a large community like that of Glasgow, where schools are ever shifting, it is difficult to ascertain the exact number; but the following abstract from Dr Cleland's Annals of Glasgow will give the reader an idea of the extent of education in this city. That indefatigable author published the names of 144 teachers; and from his statement it appeared that, exclusively of the university and thirteen institutions where youth were educated, there were 144 schools; that, including the public institutions, there were 16,799 scholars, of whom 6516 were taught gratis in charity or free schools. These schools were all in a district containing about 75,000 souls; it appeared from the same statement that Sunday schools were established in 1786, that there were 106 schools, 158 teachers, and 4668 scholars, viz. 2235 boys, and 2433 girls, besides three adult schools. An infant school society was instituted in 1827. In 1834 there were six infant schools, viz. the model school in Saltmarket, a school in Drygate, Chalmers Street, Marlborough Street, John Street, and Cowcaddens; and two school-houses are about to be built in Gorbals, and one in Anderston.

Literature.—From the commercial enterprise which engages the time and attention of its inhabitants, this city cannot boast of a literary character. There are many individuals however of cultivated minds and extensive attainments, some of whom have formed themselves into societies for the promotion of literature and science. About the middle of the last century a literary society was established, consisting chiefly of the professors and clergymen of the city and neighbourhood, and reckoned amongst its distinguished members Doctors Adam Smith, Trail, and Reid, and Mr John Millar, the celebrated professor of law. A literary and commercial society was formed about the beginning of the present century, and is composed of a number of gentlemen, who meet for the discussion of literary and commercial topics. During the twenty-seven years in which records have been kept, upwards of two hundred essays have been read by the society.

The first newspaper published in the west of Scotland was the Glasgow Courant, which appeared in the year 1715. It was published three times a week, consisted of twelve pages in small quarto, and was sold for three half-pence or "one penny to regular customers." The second number contained a letter from Provost Aird, colonel of the regiment of Glasgow volunteers, detailing his views in regard to the Duke of Argyll's ultimate success at Sheriffmuir. The name of the paper was soon changed to that of the West-Country Intelligencer, which only survived a few years. From 1715 till the present time there have been twenty-one attempts to establish newspapers in this city, and out of that number eleven still survive. The names of the papers, the dates of their commencement, and the periods of publication, are as follows:—The Glasgow Courant in 1715; the Journal in 1729; the Chronicle in 1775; the Mercury in 1779; the Advertiser in 1783, but in 1804 its name was changed to that of the Herald; the Courier in 1791; the Clyde Commercial Advertiser in 1805; the Caledonia in 1807, but in the same year it merged in the Western Star; the Sentinel in 1809; a second Chronicle in 1811; the Scotsman in 1812; the Packet in 1813; a second Sentinel in 1821; the Free Press in 1823; the Scots Times in 1825; the Evening Post in 1827; the Trades' Advocate in 1829; the Liberator in 1831; the Scottish Guardian and the Argus in 1832; and the Weekly Reporter in 1834. The eleven surviving papers are, the Journal, published once a week; the Herald, twice; the Courier, three times; the Chronicle, three times; the Free Press, twice; the Scots Times, twice; the Evening Post, once; the Liberator, once; the Scottish Guardian, twice; the Argus, twice; and the Weekly Reporter, once: so that in Glasgow there are twenty newspapers published weekly. It would be invidious to state the circulation of each paper, even if it could be accurately obtained; it is, however, known that the circulation of the Herald on each publishing day for some years past has rather exceeded eighteen hundred, and that during the quarter from the 1st of March to the 1st of June 1834 its advertisements amounted to 3291.

---

[1] In 1698, Sir Robert Sinclair of Stevenson had a grant from King William, of the whole revenue of the post-office of Scotland, with a pension of L.300 per annum to keep up the post.

The first circulating library in the west of Scotland was established in Glasgow in 1753, by Mr John Smith senior, who lent out books at the rate of one half-penny per volume. There are now many circulating as well as public and private libraries in Glasgow. Of the public libraries, exclusively of those belonging to the university, to Anderson's university, and to other literary bodies, the more valuable are, Stirling's, which was instituted in 1791; the Glasgow, in 1804; and the Robertsonian, in 1814.

Of late years a number of book societies have been established in Glasgow. They are conducted on a plan similar to that of circulating libraries, with this difference, that the books belong to the readers themselves, who are chiefly of the working classes. The periodical book-publishing trade, which, till about the year 1796, was scarcely known in Scotland, is carried on in Glasgow to an extent surpassing that of any other town in this part of the kingdom. By a late parliamentary report, it appeared that in Scotland there were 414 book hawkers, technically termed "canvassers" and "deliverers," who, on an average of seven years, collected L.44,160 per annum in sixpences and shillings, and five sixteenths of the whole belonged to Glasgow.

The Maitland Club, which was established in this city a few years ago, is similar to the Bannatyne Club of Edinburgh, or the Roxburghe Club of London, by the reprinting, for *private use*, of valuable and scarce old books, or the printing for the first time, in the same manner, of curious and rare manuscripts illustrative of the history, literature, or antiquities of Scotland. The club takes its name from Sir Richard Maitland of Lethington, an officer of state during the minority of James the Sixth, and who, like Bannatyne, did much service to Scottish literature, by compiling nearly all the poetry of the nation then in existence.

During the last thirty years several magazines and other periodical works have been published here, but none of them have succeeded.

Poor.—The proper management of the poor is everywhere important, but in a great manufacturing community, subject to numerous vicissitudes unknown to small towns and rural districts, it is peculiarly so. The poor in nine of the ten parishes of the city are maintained by an assessment on the inhabitants, aided by certain donations, and the collections or offerings at the church doors; whilst the poor of the tenth parish are maintained on a separate plan, to be afterwards mentioned, and the poor of the two suburban parishes of Barony and Gorbals by a tax on rental, aided by donations and offerings. Soon after Dr Chalmers' admission to the Tron Church, on the 21st of July 1815, he discovered that a great improvement might be made in the mode of maintaining the poor, and particularly that assessment might be dispensed with. Having explained his views to the magistrates, he was translated to St John's Church and parish, where he might be the better able to develope his plan. Accordingly, on the 18th of August 1819, the town council unanimously resolved that Dr Chalmers should have a "separate, independent, and exclusive management and distribution of the funds which may be raised by voluntary or charitable collections at the doors of St John's Church, for the relief of the poor resident in said parish." The scheme has been continued by the two clergymen who succeeded Dr Chalmers as pastors in the church; and after a trial of fifteen years, the energies of what is emphatically called the agency have not decreased. There is no intricacy in the scheme. The members of the congregation are liberal in their voluntary offerings at the church doors. The parish is divided into small districts; numerous elders and deacons, to whom districts are assigned, visit their respective poor, by which means imposition is easily detected, and the distribution of the fund to the legitimate poor is more surely and easily accomplished.

We have preferred taking the following abstract from Dr Cleland's statistical work, to any statement which could be made for 1834, as we have the advantage of the government enumeration for the former year, to enable our readers to draw results. It shows the number of paupers in the city and suburbs on the 31st of December 1830, with the expense of maintaining them during that year.

	Number of Paupers.	Expense of Maintenance.		
		£	s.	d.
St Mungo's……………	179	396	12	9
St Mary's………………	149	348	7	7
Blackfriars……………	176	362	11	0
Outer High……………	148	336	5	$1\frac{1}{2}$
St George's……………	126	354	0	2
St Andrew's…………	88	205	17	4
St Enoch's……………	137	254	5	2
St James'……………	108	228	19	$2\frac{1}{2}$
St David's……………	71	161	16	8
St John's………………	70	241	19	1
In-door and out-door paupers in hospital	1057	5773	1	7
Total in city…………	2309	7485	4	4
In Barony parish……	2237			
Gorbals………………	460	1132	18	$0\frac{1}{2}$
Total in city and suburbs………………	5006	17,281	18	$0\frac{1}{2}$

The population in the city and suburbs being 202,426, and the number of paupers 5006, there is one pauper for every $40\frac{43}{100}$ persons. The population of the ten parishes in the city being 89,847, and the number of paupers 2309, there is one pauper for every $38\frac{91}{100}$ persons. The number of paupers in the city and suburbs being 5006, and the amount of their maintenance L.17,281. 18s. $0\frac{1}{2}$d., this gives to each pauper L.3. 9s. $0\frac{6}{12}$d. The number of paupers in St John's parish being 70, and the amount of their maintenance L.241. 19s. 1d., this gives to each pauper L.3. 8s. $10\frac{1}{12}$d.

Abstract of the Expenditure of the Benevolent and Charitable Institutions of Glasgow, exclusive of Widows' Funds, Benefit Societies, Charity Schools, and Maintenance of Paupers.

The affairs of the following societies are conducted at the Religious and Charitable Institution Rooms.

Date of Formation.		Subscriptions for 1834.		
1796.	Glasgow Missionary Society………	L.735	0	0
1804.	Glasgow Bible Society………………	576	0	0

The number of patients in the hospitals and asylums on the 25th of March 1831 was 709, viz. in the Royal Infirmary 304, of whom males 143, females 161, under thirty years of age 148. In the Lunatic Asylum there were 264, viz. insane 212, of whom males ninety-nine, females 113, under thirty years forty-six; idiots eleven, of whom males eight, females three, under thirty years five; silly in mind forty-one, of whom males nine, females thirty-two, under thirty years six. In the Lock Hospital there were, females twenty-seven, under thirty years twenty-three. In the Magdalene Asylum there were thirty-three, all under thirty years. In the Deaf and Dumb Institution there were thirty-seven, males twenty-two, females fifteen, under twenty years thirty-six. The blind persons in the Asylum and Town Hospital were forty, viz. males twenty-six, females fourteen, under thirty years twenty-seven. Eye Infirmary four, males two, females two, under thirty, two.

Presbytery of Glasgow and Synod of Glasgow and Ayr.—The presbytery consists of the ten ministers of the city and the twelve surrounding parishes, viz. Barony of Glasgow, Gorbals, Rutherglen, Cumbernauld, Carmunnock, Cadder, Campsie, Govan, Kirkintulloch, Kilsyth, Cathcart, and Eaglesham; but as the ministers of the chapels of ease are about to become parish ministers, the members of presbytery will be increased. The synod consists of eight presbyteries, viz. Glasgow, Ayr, Irvine, Paisley, Hamilton, Lanark, Dumbarton, and the new presbytery of Greenock. The following is a view of the progressive stipends of nine of the ministers of Glasgow. Till 1788 the stipends were paid in Scots money, viz. in merks or pounds.

In 1638.......	L.58	16	$11\frac{1}{3}$	In 1788..........	L.165	0	0
In 1642.......	66	13	4	In 1796..........	200	0	0
In 1643.......	78	16	8	In 1801..........	250	0	0
In 1674.......	90	0	0	In 1808..........	300	0	0
In 1723.......	111	2	$2\frac{2}{3}$	In 1814..........	400	0	0
In 1762.......	138	17	$9\frac{1}{3}$	In 1830..........	425	0	0

The stipend of the minister of St Mungo is paid in grain from the teinds, viz. twelve and a half chalders of meal, twelve and a half chalders of barley, L.30 in money, and a glebe. This stipend, when the grain is at a moderate price, amounts to about L.500.

Church Accommodation.—In 1831 the population of the city and suburbs was 202,426, and the total sittings in the various places of worship in the city and suburbs 73,425, viz. in the established church 30,928, dissenters, Episcopalians, and Roman Catholics, 42,497. This is in the proportion of one sitting to $2\frac{75}{100}$ persons, or 20,291 sittings less than the amount required by law.

City Mission.—The want of church accommodation, and the total inability of the clergymen of the city to attend to the religious wants of a numerous class of the community, many of whom have no desire for religious instruction, led to the formation of the city mission. The society was instituted upon the 1st of January 1826, for the purpose of promoting the spiritual welfare of the poor of Glasgow and its neighbourhood, by employing persons of approved piety, and otherwise properly qualified, to visit the poor in their own houses, for the purpose of religious discourse, and to use other means of diffusing and increasing amongst them a knowledge of evangelical truth. In December 1831 there were twenty-two licentiates or students of divinity employed, at salaries of L.40 each; twenty of these were on full time, viz. four hours per day, and the other two on two-thirds time. In addition to the city mission, a parochial mission was instituted in 1832, and there are now one missionary in every parish, and two or three in the large ones.

Licenses to Sell Spirits.—The number of persons licensed to retail spirituous liquors in the ten parishes of the city being 1393, and the number of families 19,467, this gives one licensed person, or public house, to $13\frac{97}{100}$ families. If the number of persons who retail spirituous liquors without being able to obtain a license were taken into account on the one hand, and the number of temperate families who never use a public house on the other, it may be said that in Glasgow there is at least one place where spirits are retailed for every twelve families.

Pawnbrokers.—The business of a pawnbroker was not known in Glasgow till August 1805. At that period an itinerant English pawnbroker commenced business in a room in the High Street, but was obliged to give up at the end of six months, for want of business; and it was not until the 8th of June 1813 that John Graham, a disbanded town-officer, set up a regular pawnbroking office. There are now twenty-two licensed pawnbrokers in the city.

River Clyde.—As the river Clyde, in a commercial point of view, is of the utmost importance, not only to Glasgow, but to the western district of Scotland, a brief account of its improvements must therefore be interesting. In the beginning of the sixteenth century the channel of the river for about thirteen miles below Glasgow was so incommoded by fords and shoals as to be scarcely navigable for even small craft. But in 1556 the inhabitants of the burghs of Glasgow, Renfrew, and Dumbarton, entered into an agreement to excavate the river for six weeks alternately, with the view of removing the ford at Dumbuck, and some lesser fords. By the exertions of these parties small flat-bottomed craft were brought up to the Broomielaw at Glasgow, which was then only a landing shore, there being no regular harbour for more than a hundred years after that period. In 1653 the citizens of Glasgow had their shipping harbour at the bailiery of Cunningham, in Ayrshire; but this port being distant, and the land-carriage expensive, the magistrates of Glasgow treated with the magistrates of Dumbarton for ground on which to build a harbour and docks at Dumbarton. After much discussion the negotiation broke up, the magistrates of Dumbarton considering that the great influx of mariners would "raise the price of provision to the inhabitants." The magistrates of Glasgow then turned their attention to the Troon; and here they were again repulsed for a similar reason. In 1662, however, they succeeded in purchasing thirteen acres of ground from Sir Robert Maxwell of Newark, on which they laid out the town of Port-Glasgow, built harbours, and made the first dry or graving dock in Scotland. Soon after the Revolution in 1688 a quay was formed at the Broomielaw, at the expense of 30,000 merks Scots, or L.1666. 13s. 4d. sterling. The east end was at the mouth of St Enoch's Burn, and the west at Robertson Street.

At length, when the magistrates had got a shipping port and a quay, they directed Mr Smeaton, the celebrated engineer, to inspect the river; and on the 13th of September 1755 he reported, *inter alia*, that the river at the ford at the Point House, about two miles below Glasgow, was only one foot three inches deep at low water, and three feet eight inches at high water. He proposed that a lock and dam should be made at the Marlin ford, in order to secure four and a half feet water up to the quay at Glasgow. The lock was to be seventy feet long and eighteen feet wide, and so deep as to take in a flat-bottomed lighter at four and a half feet draught of water. An act of parliament was procured for the above purpose, but nothing further was done in it.

The magistrates then required the assistance of Mr John Golborne of Chester, and he reported, on the 30th of November 1768, that the river was in a state of nature; and that at the shoal at Kilpatrick Sands, and at each end of the Nushet Island, there was no more than two feet of water. He then proposed to contract the river by jetties for eight miles below Glasgow, and to dredge and deepen it, at an expense of L.8640. Mr Golborne having suggested that a survey of the river should be taken, the magistrates employed Mr James Watt, afterwards the celebrated improver of the steam-engine, who, along with Dr Wilson and Mr James Barrie, reported that several parts of the river from the Broomielaw to the Point House had less than two feet water. In 1770 an act of parliament was procured, by which the members of the city corporation were appointed trustees, with power to levy dues. The trustees then contracted with Mr Golborne for deepening the river, and in January 1775 he had erected 117 jetties on both sides, which confined it within narrow bounds, so that vessels drawing more than six feet water came up to the Broomielaw at the height of the tide. On the 7th of September 1781 Mr Golborne made an estimate for bringing vessels drawing seven feet water to the Broomielaw; and on the 22d of August 1799 Mr John Rennie, civil engineer, London, reported his opinion respecting the deepening of the river; as did Mr Thomas Telford, civil engineer, London, on 24th of May 1806; Mr John Rennie again, on the 24th of December 1807; Mr Whidbey of Plymouth on the 22d of September 1824; Mr John Clark, superintendent of the river, on the 11th of November 1824; and Mr Atherton, civil engineer, Glasgow, in 1833. In 1825 the trustees obtained another act of parliament, appointing five merchants not connected with the corporat n, additional trustees on the river; and increasing the ces on all goods passing on the river from 1s. to 1s. 4d. pr ton, and on the admeasurement of all vessels coming t the harbour, in name of harbour dues, from 1d. to 2d. pr ton. The same act authorized dues to be levied for the u of the sheds, according to a regulated schedule; the f mer dues of 1s. per ton on coals having been taken off.

Mr James Spreull was appointed superintendent of the rer in 1798; and, until his death in 1824, he was enthusstic in every thing that related to its improvement. Te increase of trade at the Broomielaw, in consequence o these improvements, almost exceeds belief. Less than fily years ago a few gabbards, and these only about trty or forty tons, could come up to Glasgow; now large vsels, many of them upwards of 300 tons burden, from Aerica, the East and West Indies, and the Continent, a often to be found three deep along nearly the whole lgth of the harbour. A few years ago the harbour was oy 730 feet long; it is now 3340 feet long on the north se of the river, and 1260 on the south. Till of late yrs there were only a few punts and ploughs for the prpose of dredging the river; now there are four dredgi machines with powerful steam apparatus, and two divi bells. Till lately there were no covering for goods at t harbour, and but one small crane for loading and discirging; now the shed accommodation on both sides of t river is most ample, and one of the cranes for shippg steam-boat boilers, and other articles of thirty tons, nde by Messrs Claud Girdwood and Co., may, for the uon of power with elegance of construction, challenge a the ports in the kingdom.

The river for seven miles below the city is confined whin narrow bounds; and the sloping banks, formed of winstone, in imitation of ashlar, are unequalled in the kgdom, whether their utility or their beauty be taken into aount. By the year 1831, vessels drawing thirteen feet s inches of water were enabled to come up to the harbur of the Broomielaw. The increase of trade on the Cde having far exceeded what even the most sanguine cld have contemplated, we think that some parts of the rer may be widened with advantage. In 1834 the trusts appointed Mr Logan, civil engineer, a gentleman of gat talent and experience, to direct the improvements o he river.

Till 1834 the river and harbour dues were annually disped of by public sale, but they are henceforth to be collcted by the trustees. The following is a statement of the aunt of dues in the years specified. In 1771 the first yr's dues were L.1021; in 1810, L.4959; in 1812, L525; in 1814, L.6128; in 1833, L.20,260; and in 14, L.21,260, exclusive of shed dues, which in 1833 aunted to L.1283, and in 1834 to L.1564.

The burgesses of Dumbarton are exempt from river dues, i irtue of an old charter. From the time the exemption w first claimed, on 9th July 1825 to 8th July 1834, they aunted to L.4722. 13s. viz. sailing vessels L.803. 13s. 4 steam ditto L.3918. 19s. 8d., less L.170. 3s. 1d. paid b shareholders in steam-boats who were not burgesses of L mbarton.

The river dues have been greatly increased by steam nigation, as appears from the following statement. From 8 July 1833 to 9th July 1834, the river dues collected sod to the gross revenue as follows: Total tonnage on mchandize, $70\frac{1}{4}$ per cent.; ditto by sailing vessels, includir ferries, $38\frac{5}{6}$ per cent.; ditto by steam ditto, $31\frac{3}{8}$ per ct.; quay dues by ditto $15\frac{1}{6}$ per cent.; ditto by sailing do $5\frac{1}{3}$ per cent.; shed dues $5\frac{7}{12}$ per cent.; ferries $3\frac{5}{8}$ p cent. Total steam to total sailing vessels as $87\frac{7}{60}$ to 1.

pplication of the Steam-Engine in propelling Vessels.—T application of steam in propelling vessels long engaged the attention of men of mechanical genius. In 1736, Mr Jonathan Hulls obtained a patent for "a new invented machine for carrying vessels or ships out of or into any harbour, port, or river, against wind and tide, or in a calm;" but this scheme did not succeed. In 1781, the Marquis de Fouffroy made some unsuccessful experiments in propelling vessels by steam on the Saone at Lyons. In 1785, Mr James Rumsey of Virginia, and Mr John Fitch of Philadelphia, made several experiments, which were also unsuccessful. In the same year, Mr Patrick Miller of Dalswinton, Dumfriesshire, made several experiments with paddles on twin and triple vessels worked by men and horses, an account of which he published in July 1787. Soon after this, Mr Miller built a boat with two keels, between which he introduced a propelling paddle; and Mr William Symington of Falkirk applied the steam-engine to it; and in 1788 Mr Miller and Mr Symington made an experiment with it on Dalswinton pond. But after several attempts, it was found that the engine and wheel were so inefficient as occasionally to require the assistance of manual labour at a windlass. Some time after this, Mr Miller caused a larger engine to be made at Carron Works, and an experiment was made with it on the Forth and Clyde Canal, which, though answering better than the former, did not succeed. In 1794, the Earl of Stanhope constructed a steam-vessel with paddles under her quarters, but with no better success. In 1801 and 1802, Lord Dundas, then governor of the Forth and Clyde navigation, employed Mr Symington to construct a steam-boat for that canal; but this boat, from what Mr Symington called the "opposition of narrow minds," was laid up in a creek near Bainsford Bridge, where it remained as a wreck for many years.

The whole race of steam propellers having thus left the field one by one, without being able to effect their object, the ground was occupied by Mr Henry Bell, who having a turn for mechanics, made a steam-engine of three horse power, and employed Messrs John Wood and Company, shipbuilders in Port-Glasgow, to build a boat for him, which he called the Comet. In January 1812, every thing being in readiness, the Comet began to ply between Glasgow and Greenock, and made five miles an hour against a head wind, whilst by simply increasing her power she went at the rate of seven miles an hour. This was the first vessel that was successfully propelled on a navigable river in Europe; and it is very remarkable, that notwithstanding the great progress in mechanical science, no improvement has yet been made on Mr Bell's mode, although numerous efforts have been made here and elsewhere for that purpose. It is true that boats go swifter now than formerly, but the propelling system remains the same. To this brief account of the origin of the steam propelling system in this country, it must be added that the Americans preceded us fully four years. In October 1807, Mr Robert Fulton, an American engineer, launched a steam-boat at New York, which plied with great effect between that city and Albany, a distance of 160 miles.

The above tonnage is register measure; carpenters' measure in steam-vessels is about *one third* more.

The number of river boats for 1831 included all those which had plied during any part of that year. Many, however, were sold, some were broken up, and others were withdrawn in the course of the year, and there were not so many as twenty-five running at any *one time.* This accounts for the apparent falling off in 1834, as the twenty-one given for that year were actually plying in December. There is therefore an increase of boats plying on the river, and preparations are making to establish several others. All the new boats, either for the outsea or river trade, are of larger dimensions, greater engine power, and are much more splendidly fitted up for the accommodation of passengers than heretofore. The speed is also greatly improved. The Liverpool boats in 1831 were thought to have made good passages when they performed the run from Liverpool to Greenock, a distance of 220 miles, in twenty-four to twenty-six hours. It is now done much sooner. The steam packet Manchester, of 387 tons carpenters' measurement, belonging to Messrs James Martin and James and George Burns and Co. of this city, left the Clarence dock, Liverpool, on Monday evening the 15th December 1834, and arrived in Glasgow, a distance of 240 miles, discharged and loaded her cargoes, and was back again in the same dock, within the short period of sixty hours. This being done in the dead of winter, studying the tides in the Mersey and Clyde shows what can be done by steam navigation. The cabin fares for the river boats are rather less than one penny per mile, and outsea boats rather more. To Liverpool the fare is L.1. 5s.

Stage-Coaches.—Stage-coaches were first used in Scotland in 1678. The first mail-coach from London to Glasgow arrived at the Saracen's Head on Monday the 7th of July 1788; at that period the mail went by Leeds, a distance of 405 miles, and arrived in sixty-five hours, being nearly six and a half miles in the hour; in 1834, the mail goes by Wetherby, a distance of 395 miles, and arrives in forty-one hours and three fourths. The speed from Carlisle to Glasgow is at the rate of eleven miles an hour. On the 10th of January 1799, Mr John Gardner of the Buck's Head, Glasgow, started a coach to Edinburgh with four horses, which performed the journey of forty-two miles in six hours. The time now occupied on the road by stage-coaches is about four hours and a half.

In 1833 there were on an average sixty-one stage-coaches which departed from and returned to Glasgow every lawful day. The mails every day, viz. to London two, Edinburgh twelve, Paisley thirteen, Hamilton five, Lanark three, Perth two, Stirling two, and to other towns twenty-two. These coaches were drawn by 183 horses, and 671 horses were kept for them. They accommodated 832 passengers, viz. inside 284, outside 548.

Private Carriages.—Mr Allan Dreghorn, timber merchant and builder, was the first person who started a private carriage in this city; it was made by his own workmen in 1752. The number of carriages in the city and suburbs charged with duty in 1832 was 402, viz. stage-coaches sixty-one, hackney carriages 140, private carriages 201, viz. with four wheels 112, two wheels 89.

Relays of post-chaises did not exist in Scotland, except on the road from Edinburgh to London, till the year 1776, and even in England relays are of comparatively recent date. Mr John Glasford, and Mr Andrew Thomson senior, Glasgow merchants, went to London on horseback in the year 1739. At that period there was no turnpike road till they came to Grantham, within 110 miles of London. Up to that point they travelled upon a narrow causeway, with an unmade soft road upon each side of it; and they met from time to time strings of pack-horses, from thirty to forty in a gang, the mode by which goods were transported from one part of the country to another.

The Forth and Clyde Navigation.—In 1768, an act of parliament was obtained for making a canal from the river Forth at or near the mouth of the river Carron in the county of Stirling, to the river Clyde at or near Dalmuir Burnfoot in the county of Dumbarton, with a collateral cut to the city of Glasgow. On the 10th of June in that year, Sir Lawrence Dundas dug out the first spadeful of earth for the formation of the canal, and it was opened from the eastern to the western sea on the 28th of July 1790. On the 11th of November in the same year, the basin at Port Dundas was finished. The length of the navigation from the Forth to the Clyde is thirty-five miles, and the cut to Glasgow two and a half miles. There are thirty-nine locks on the canal, namely, twenty from the Forth to Glasgow, and nineteen between the great aqueduct and the Clyde. The length of the locks between the gates is seventy-four feet, the width twenty feet, and the fall ten feet. The medium width of the surface of the canal is fifty-six feet, at bottom twenty-seven feet, and the depth upwards of ten feet. The rise from the east sea to the summit-level of the Canal at Wineford Lock is 156 feet, and the descent to the Clyde 150 feet, so that the Forth at the east end of the canal is six feet lower than the Clyde at Bowling. This great canal, which required twenty-two years to complete, was one of the most arduous to execute in the kingdom, having to encounter rocks, precipices, and quicksands; in some places it runs through a deep moss, and in others it is banked twenty feet high. It crosses many rivulets and roads, as well as two considerable rivers, the Luggie and the Kelvin. The bridge over the latter, which consists of four arches, and carries the canal across a deep valley, cost L.8509. The canal is supplied with water by eight reservoirs, covering 721 acres, and containing 24,902 lockfulls of water.

Mr Kirkman Finlay of Castle Toward, the present governor, was elected to that important office on 20th March 1816. At the following balance the rate per cent. on each original share of L.100 was L.25; in the preceding ar L.17. 10s. The annual average revenue during sixen years previous to Mr Finlay being appointed goverr was L.30,323. 7s. 6d. and the annual average revenue ring sixteen years after it was L.46,680. 11s. 4d.

In 1832 there were two steam passage boats on the nal, each of twenty-four horse power. These boats nt at the rate of six miles an hour. In 1833 the steamats gave place to swift iron boats, which travel at the e of ten miles an hour. Four of these boats leave Port ndas for Stirling and Edinburgh, and return every law day, and four additional ones are in a state of preparan. In 1832 the revenue from steam and heavy drag ats was L.1213. 19s. 5d. In 1833 from the swift boats 3007. 19s. 1d.; and in 1834 upwards of L.5000.

Monkland Canal.—This canal affords a cheap commuation between the city of Glasgow and the collieries the parishes of Old and New Monkland, distant about elve miles. The canal was originally thirty-five feet ad at the top, and twenty-four at the bottom; depth of ter upon the locksills five feet, and the smallest depth oughout any part of the canal four feet six inches. e banks have been recently raised, by which a greater pth of water is procured. At Blackhill there are four ks of two chambers, each chamber seventy-one feet g, fourteen feet broad, and twelve feet deep. The head el, at the top of Blackhill, is continued to Sheepford, a tance of eight miles, where there are two single locks of ven feet six inches each, which carries the canal to the er Calder. In the spring of 1813 three passage-boats gan to ply to Sheepford, about a mile from Airdrie. is canal has been productive to the stockholders for a nber of years past.

lasgow, Paisley, and Ardrossan Canal.—The expense and carriage from Glasgow to the west coast, through fertile counties of Lanark, Renfrew, and Ayr, aboundwith coal and limestone, was long a desideratum. The rations on the canal commenced in May 1807, and the igation opened between Glasgow and Johnston on the of October 1811. Although the canal was opened at t period, the trade did not commence till April 1812. e length of the canal from Port Eglintoun to Ardrossan is rty-two miles and three quarters; from Port Eglintoun Johnston eleven miles; breadth at top thirty feet, bottom eighteen feet, and depth four feet six inches. ere are no locks on that part of the canal yet executed, . between Port Eglintoun and Johnston; but when the al is carried forward, there will be eight near Johnston raise the canal to the summit-level, and thirteen to fall wn to the harbour of Ardrossan. On the 6th of Novem 1810, boats were put on this canal, but Mr Houston of nston Castle has the merit of introducing swift iron ats. During 1830 these boats made four trips daily, raging twenty-five passengers each trip; in 1831 eight ps, averaging thirty-two passengers; in 1832 fourteen ps, averaging thirty-four passengers; and during the t six months of 1833 they made eighteen trips, averag forty-five passengers. During the months of July and gust 1834, 50,000 passengers went along the canal; number in one day was 2500. The proportions of the t cabin and second cabin passengers are, one fifth of the t cabin passengers at one penny per mile, and four hs of second cabin passengers at three farthings per mile. e average total fare on the canal is therefore sixteen entieths of a penny per mile. The swift boats on the rth and Clyde and Union Canals ply at similar rates.

Union Canal.—The Union Canal was begun on the 3d of rch 1818. It is thirty-one miles and a half in length m Port Hopetoun, near Edinburgh, to Port Downie, near kirk. The navigation for ten miles west from Port petoun was opened on the 22d of March 1822, and to rt Downie early in May thereafter. The canal is on a level line for thirty miles from Port Hopetoun; the remaining distance is occupied by eleven locks, each ten feet deep, so that the Union Canal, at the head of the locks, is 110 feet above the Forth and Clyde Navigation. The Union Canal is forty feet broad at the top, twenty feet at the bottom, and five feet deep. This canal has not yet been productive to such stockholders as have not an interest in the Forth and Clyde Navigation.

The intercourse with Glasgow by coaches, steam-boats, track-boats, and rail-roads, is so great that it almost exceeds belief. As some of the coaches and steam-boats depart and arrive more than once a day, and the mail-coaches every day, the following may be taken as a low average of passengers by stage-coaches and steam-boats, while the others are from the books of the respective companies. During 1834, sixty-one stage-coaches, each averaging twelve passengers, arrived and departed during 313 lawful days. This amounted to 458,232 persons in the year. By thirty-seven steam-boats, twenty-five passengers each, 579,050; by the swift boats on the Forth and Clyde Navigation and Union Canal, 91,975; by the light iron boats on the Paisley Canal, 250,000; by the boats on the Monkland Canal, 31,784; and by the Glasgow and Garnkirk Rail-road, 118,882; making the gross number of passengers amount to 1,529,923.

Trade, Arts, and Manufactures.—Glasgow is advantageously situated for commercial pursuits. Placed on the borders of one of the richest coal and mineral fields in the island, with which it communicates by the Monkland Canal, and by various rail-roads, and connected on the one hand with the Atlantic by the Clyde, and on the other with the North Sea and the German Ocean by the Forth and Clyde Navigation and the river Forth, it possesses facilities peculiarly favourable for trade. Notwithstanding these local advantages, Glasgow was not remarkable for trade until a considerable time after the union with England. Its importance, in a commercial point of view, may be greatly attributed to the improvements on the Clyde, and to the enterprising spirit of its merchants and manufacturers during the last seventy years. In 1420, a Mr Elphinstone is mentioned as a curer of salmon and herrings for the French market; and Principal Baillie mentions that this trade had greatly increased between the years 1630 and 1664. As an encouragement to trade, then in its infancy, an act was passed, in which it was stipulated that the whole materials used in particular manufactures should be exempt from duty; and in the same parliament it was enacted, for the better encouragement of soap manufacturers, that oil, potashes, and other materials for making soap, should be exempt from duty. On 31st of January 1638, "Robert Fleyming and his partners made offer to the town council to set up a manufactory in the city, wherein a number of the poorer sort of people may be employed, provided they met with sufficient countenance. On considering which offer, the council resolved, in consideration of the great good, utility, and profit, which will redound to the city, to give the said company a lease of their great lodging and backyard in the Drygate, excepting the two front vaults, *free of rent* for the space of seventeen years. On 8th May thereafter, the deacon convener reported that the freemen weavers were afraid that the erecting of the manufactory would prove hurtful to them. On which Patrick Bell, one of the partners, agreed that the company should not employ any unfree weavers of the town."

Letter-press printing was introduced into Glasgow by George Anderson in the year 1638; and one of the first works printed by him was an account of the general assembly, which met there the same year. Anderson came to Glasgow in consequence of an invitation from the magistrates. It appears, from the records of the town council, 4th January 1640, that the treasurer was directed to pay him L.100 in satisfaction of his expenses, "in transporting of his gear to this burghe," and in full of his bygone salaries from Whitsunday 1638 till Martinmas 1639. It also appears, from the records of the council, 10th June 1663, that Anderson was succeeded by his son Andrew as ordinary printer to the town and college, on condition of his "services as well and his prices being as easy as others." Andrew, who had been a printer in Edinburgh, not finding matters to his mind here, returned to Edinburgh, and in 1671 he was made king's printer for Scotland. Anderson was succeeded in Glasgow by Robert Saunders, who styled himself printer to the city, and who was for many years the only printer in the west of Scotland. But his predecessor, now the royal typographer, came to Glasgow, and by threats and promises prevailed on Saunders' workmen to desert him in the midst of an impression of the New Testament. This oppressive conduct brought the matter before the privy council, which decided, in December 1671, that Saunders should be allowed to finish his book, and that any printer in Scotland had an equal right with his majesty's to print the New Testament and Psalm Book in the letter commonly called English Roman. Saunders died about 1696, leaving his printing establishment to his son Robert, better known by the designation "of Auldhouse," a property purchased from a younger branch of the family of Maxwell of Pollock. A few of the works first printed by him were tolerably executed; but his latter productions are extremely paltry and inaccurate. Printing was now, and for some years afterwards, in the lowest state in Scotland. The exorbitancy of the royal grant to Anderson had produced the worst effects. No person appears to have been employed for the sole purpose of correcting the press; and the low wages given to pressmen, with the badness of the machines themselves, also tended to retard the improvement.

The university, in the mean time, was not wanting in efforts to improve the printing in Glasgow. A paper, entitled "proposals for erecting a bookseller's shop and a printing-press in the university of Glasgow," appears to have been presented to the faculty in 1713, in which it is mentioned that they were "obliged to go to Edinburgh in order to get one sheet right printed." During the same year, Thomas Harvie, a student of divinity, engaged to furnish one or more printing presses, and in the course of four years to furnish founts and other materials for printing Greek, Latin, and Hebrew, on condition that he should be declared university printer and bookseller for forty years, "with all the privileges and immunities which the university hath or shall have hereafter to bestow on their printer and bookseller." Although these terms were probably not ultimately accepted, they seem at least to have been under frequent consideration; and the sketch of a contract with Harvie is preserved among the university papers. Two years afterwards, "Donald Govane, younger, merchant in Glasgow, and printer," was appointed to the same office for seven years; but his name appears at very few books.

James Duncan, who printed M'Ure's History of Glasgow, continued to print here till about the year 1750. Robert Urie and Company were printers in the Gallowgate in 1740, and during the following year executed several works for Robert Faulls (improperly termed Fowlis). Urie is entitled to the credit of adding to the respectability of the Glasgow press. Amongst the finest specimens of his work are his editions of the Greek New Testament and of the Spectator. But the art of printing was carried to great perfection by the Messrs Faulls, who introduced into Glasgow a style of printing which, for beauty and correctness, has never been surpassed in any country. A brief account of these distinguished persons cannot fail to be interesting.

Robert Faulls, the eldest son of Andrew Faulls, was born in or near Glasgow, on the 20th of April 1707, and his brother Andrew on the 22d of November 1712. Robert was sent, at an early period, as an apprentice to a barber, and seems to have practised the art of shaving for some time on his own account. While in this situation Dr Francis Hutchison, then professor of moral philosophy in the university, discovered in him the talent which was afterwards cultivated with so much success, encouraged his desire of knowledge, and suggested to him the idea of becoming a bookseller and printer. Although Robert Faulls did not receive a complete university education, he continued to attend for several years the lectures of his patron; but Andrew received a more regular education, and for some years taught the Greek, Latin, and French languages. Having thus acquired a pretty accurate knowledge of books, Robert began business in Glasgow as a bookseller in 1741, and in the following year the first production of his press appeared. He was assisted in the correction of his press by George Rosse, then professor of humanity in the university, and by James Moor, at that time a tutor about the college, and afterwards professor of Greek. To these advantages must be added the appointment, on 31st March 1743, of the elder brother as printer to the university. In the same year he produced Demetrius Phalerius *de Elocutione*, apparently the first Greek book printed in Glasgow, though George Anderson's printing-house had been nearly a century before supplied with Greek and Hebrew types. In 1744 appeared the celebrated edition of Horace, the proof sheets of which, it is well known, were hung up in the college, and a reward offered to any one who should discover an inaccuracy. By the year 1746, Faulls had printed eighteen different classics, besides Dr Hutchison's class-book in English and Latin; and Homer, with the Philippics of Demosthenes, were advertised as in the press. The Homer appeared in the following year, both in a quarto and in an octavo form. The first of these is a very beautiful book, and more correct than the other, which was printed after Dr Clarke's edition. The success which had attended the efforts of the Faullses as printers induced the elder brother to extend the sphere of his usefulness. After being four times abroad, he sent home to his brother a painter, an engraver, and a copperplate printer, whom he had engaged in his service, returned to Scotland in 1753, and soon afterwards instituted an academy for painting, engraving, moulding, modelling, and drawing. The university allowed him the use of what is now the Faculty Hall as an exhibition room for his pictures, and of several other rooms for his students; and three Glasgow merchants afterwards became partners in the undertaking. The students, according to the proposed plan, after having given proofs of genius at home, were to be sent abroad at the expense of the academy. But the scheme, which was somewhat romantic, did not succeed, and was attended with considerable loss to all concerned. In Faulls' own words, "there seemed to be a pretty general emulation who should run it most down."

Letter-press printing has been carried on of late years to such an extent that it could not be accomplished without the aid of steam. Messrs Ballantyne and Company of Edinburgh were the first in Scotland who printed by steam. In 1829 or 1830, they fitted up a steam-press for printing Blackwood's Magazine and the Waverley novels. Soon after this the Edinburgh, Leith, and Glasgow Advertiser was printed by steam, then the Edinburgh Weekly Chronicle, Chambers' Journal, and the Farmers' Magazine. In 1831 the Aberdeen Journal was printed in this way; and in 1834 Mr Edward Khull fitted up a steam-press for printing the Church of Scotland Magazine in this city.

A copartnery for carrying on the whale-fishery, and making soap, was entered into in this city on the 15th of September 1674. Mr George Maxwell of Pollock, who was created a baronet in 1682, Provost William Anderson, and James Colquhoun, late one of the bailies of the city, were among the original partners. The company employed five ships; and the Providence, built at Belfast, was sailed by John Anderson, one of the partners. The company had extensive premises at Greenock for boiling blubber and curing fish. An advertisement from the company appeared in the Glasgow Courant on the 11th of November 1715, being the first advertisement in the first newspaper in the west of Scotland. It was in the following words:—“Any one who wants good black or speckled soap, may be served by Robert Luke, manager of the soaparie of Glasgow, at reasonable rates.” The soaparie was at the head of Candleriggs Street, now the Commercial Buildings.

A copartnery for the manufacture of ropes was entered into on the 17th of March 1696. Mr William Crawford of Jordanhill, and Mr James Corbet of Kenmure, were among the first partners. In 1698 an act of parliament was passed for the further encouragement of the manufacture of ropes and cordage in Glasgow, laying a duty on all ropes imported from the Sound or east seas; and, in return, the company were to advance a capital of L.40,000 Scots, and to bring in foreigners to the work. It is probable that the company's first premises had gone into decay, as the buildings of what was afterwards known by the name of the Glasgow Ropework Company, reaching between Stockwell Street and Jamaica Street, were not erected till the autumn of 1766.

With regard to sugar-houses, although the colonies were not laid open to the Scotch until the union, it appears that there were sugar-houses in Glasgow long before that period; for in an action which the crown brought against the sugar bakers in Glasgow and Leith, it was urged that they had not only enjoyed the exemption from the duties and customs on the import of materials for a great number of years, but also the duties of excise upon the spirits and other commodities manufactured by them. At length, in 1715, a process was raised against them for the bygone excise duties; and in 1719 the Court of Exchequer found them liable in the sum of L.40,000 sterling. As the trade could not pay any such sum, a compromise was suggested, and a clause added to an act of parliament authorizing the treasury to treat with them; and by another act the sugar manufacturers were acquitted of the L.40,000 on relinquishing their right of exemption from duties and customs. The statute is general, and seems to subject all other privileged parties to the general custom and excise of the nation. The only parties in Scotland at that time exempt from the importation duties were the Glasgow and Leith sugar companies, the Glasgow soap work, the rope-work companies, and a pin manufactory; the three last made a claim as a compensation for the surrender of their private rights, which does not seem to have been attended to. The buildings of Stockwell Place are now erected on the site of the sugar-house.

The tanning of leather seems to have been carried on in Glasgow from an early period. The Glasgow Tan-work Company, whose extensive premises were at the head of the Gallowgate, commenced soon after the union. There seem to have been three sets of partners in this great undertaking. In 1780 the names of Provost John Bowman, Mr Alexander Speirs of Elderslie, Mr John Campbell of Clathic, Mr Robert Bogle of Daldowie, Mr Robert Marshall, and others, appear among its partners.

The brewing business, like the tanning, seems to have been carried on with great spirit. Soon after the union, Mr Crawford of Milton erected an extensive brewery at Grahamston, afterwards the property of Mr Robert Cowan. The brewing trade was carried on extensively here at an early period by the Anderston Brewery Company, and by Messrs Blackstock, Baird, Struthers, Buchanan, &c.

Previously to the union, the foreign trade of Glasgow was chiefly confined to Holland and France. The union of the kingdoms, which took place in 1707, having opened the colonies to the Scotch, the merchants of Glasgow immediately availed themselves of the circumstance, and having engaged extensively in a trade with Virginia and Maryland, soon made their city a mart for tobacco, and the chief medium through which the farmers-general of France received their supplies of that article. In 1721 a remonstrance was preferred to the lords of the treasury charging the Glasgow merchants with fraud. After having heard parties, and considered the representation, their lordships dismissed the complaint as groundless, and proceeding from a spirit of envy, not from a regard to the interest of trade or the king's revenue. To such an extent was this branch of commerce carried on in Glasgow, that for several years previously to 1770 the annual import of tobacco into the Clyde was from 35,000 to 45,000 hogsheads. In 1771, 49,016 hogsheads were imported. As the Glasgow merchants were enabled to undersell, and did undersell, those of London, Bristol, Liverpool, and Whitehaven, jealousies arose which ended in litigation. As the tobacco trade was suspended in 1783, at the breaking out of the war with America, the merchants of Glasgow engaged their capital in other pursuits.

Some attempts having been made to open a connection with the West Indies, the imports from that quarter into the Clyde in 1775 were as follow: Sugar 4621 hogsheads and 691 tierces, rum 1154 puncheons and 193 hogsheads, cotton 503 bags. The following excerpt of imports into the Clyde from the custom-house books shows the great increase of this trade. In the year ending the 5th of January 1815, immediately preceding the battle of Waterloo, there were imported; sugar, 540,198 hundredweights, two quarters, twenty-five pounds; rum, 1,251,092 gallons; cotton wool, 6,530,177 pounds. The import duties of these and other articles amounted to L.563,058. 2s. 6d.; and the produce was imported in 448 ships, carrying 79,219 tons, and employing 4868 men in navigating them. These imports are, exclusive of grain, hemp, tallow, &c. from the Baltic through the Great Canal. The exports during the same period to America, the West Indies, and Europe, amounted to L.4,016,181. 12s. 2½d.; and 592 ships, 94,350 tonnage, and 6476 men were employed in this traffic.

In 1718 the art of type-making was introduced by James Duncan. The types used by him are evidently of his own making, being rudely cut and badly proportioned. He deserves credit however for the attempt; and his letters are little inferior to those used by the other Scottish printers of that period. He continued to print for many years, and is well known as the typographer of M‘Ure's History. In this book, which is not a creditable specimen of his work, he is styled “printer to the city.”

In 1740 the art was brought to great perfection by Mr Alexander Wilson, afterwards professor of astronomy in this university, and by his friend Mr John Baine. They first settled at St Andrews, the place of their nativity; but soon after removed to Camlachie, a suburb of this city, where they carried on business till the partnership was dissolved on Mr Baine's going to Dublin, where he remained but a short time. The professor removed to Glasgow, and lived to see his foundery become the most extensive and the most celebrated of any in Europe. At his death the business was carried on by his son, and continued by the family on a very extensive scale for a number of years. As a considerable part of their types went to London and Edinburgh, and as other type-makers had commenced business here, the Messrs Wilsons removed in 1834 their business from this city, one part of it to London, and the other to Edinburgh, Alexander conducting the London department, and Patrick the Edinburgh.

Although the origin of stereotyping is uncertain, it is evident that it was not invented by the French. If it be a modern invention, or there be any question as to the country in which it was first used, the Scots are entitled to the preference; for there certainly was an instance of the art having been used in Edinburgh many years before the earliest date at which it is said, or is even supposed to have been used in France. And in evidence of this, reference is made to the original stereotyped page of Sallust, with the plate and matrix, as well as a copy of the book, in the Hunterian Museum at Glasgow. Mr Andrew Duncan introduced stereotyping into this city in 1818; and since that period Messrs Hutchison and Brookman, Edward Khull, university printer, Blackie and Son, and Fullerton and Co. carry on the business of stereotyping to a very great extent.

Steam-Engines, as applicable to Manufactures.—As the great improvement on the steam-engine was made in Glasgow, a brief account of that mighty engine may not be improper here. The steam-engine was invented in the reign of Charles II. by the Marquis of Worcester, who, in the year 1663, published a book entitled *A Century of Inventions.* But as the marquis, though notable as a theoretical projector, knew little of practical detail, Captain Savary took up the subject, and published a book in 1696, entitled *The Miner's Friend,* where he described the principles of his improvement, for which he obtained a patent. About this time, Papin, a Frenchman, came to England, and becoming familiar with the elastic power of steam, he was, on his return home, employed by Charles, landgrave of Hesse, to raise water by a machine which he constructed; and from this his countrymen affected to consider him as the inventor of the steam-engine. In 1707, the doctor published an account of his inventions. Not long after this, Mr Amonton contrived a machine which he called a fire-wheel. It consisted of a number of buckets placed in the circumference of the wheel, and communicating with each other by very circuitous passages. One part of the circumference was exposed to the heat of a furnace, and another to a stream or cistern of cold water. At the death of Amonton, M. Dessandes, a member of the Academy of Sciences at Paris, presented to the academy a project of a steam-wheel, where the impulsive force of the vapours was impelled; but it met with little encouragement. In the mean time, the English engineers had so much improved Savary's invention, that it supplanted all others. Mr Newcomen, a blacksmith at Dartmouth in Devonshire, observing that Savary's engine could not lift water from deep mines, set his genius to work, and made great improvements on it. Savary's engine raised water by the force of steam, but in Newcomen's contrivance by the pressure of the atmosphere, and steam was employed merely as the most expeditious method of producing a vacuum. This engine was first offered to the public in 1705, but its imperfections were not removed till 1717, when Mr Beighton brought the machine into the form in which it continues without any material change till the present day.

The greatest improvement on the steam-engine was, however, reserved for Mr James Watt, who was born at Greenock on the 19th of January 1736. When Mr Watt had completed his education in Glasgow, he went to London in 1754, and returned in 1757, and in a short time he was appointed philosophical instrument maker to the university. This circumstance laid the foundation of an intimacy with Drs Adam Smith, Black, and Dick, Mr Anderson, Mr Robison, and other distinguished persons connected with the university. In contemplating the principles of a small working model of Newcomen's steam-engine which Professor Anderson sent him to repair, Mr Watt thought it capable of improvement; and having procured an apartment in Delftfield, he shut himself up along with his apprentice, Mr John Gardner, philosophical-instrument maker, and it was in this place that the foundation of the great improvement on the steam-engine was laid. In 1769, Mr Watt, on the recommendation of Dr Black, formed a connection with Dr Roebuck of Carron Iron Works, when he left Glasgow for Kinneil House, near these works, where he constructed a small steam-engine. The cylinder was of block-tin, eighteen inches diameter. The first experiment, which was made at a coal mine, succeeded to admiration; indeed his success was so great, that he procured a patent "for saving steam and fuel in fire-engines." Dr Roebuck's affairs becoming embarrassed in 1775, Mr Watt formed a connection with Mr Boulton of Soho, Birmingham, where they had the exclusive privilege of making steam-engines for a period of twenty-five years.

On the expiration of the exclusive privilege, the engineers of this city commenced making steam-engines; and to such an extent is this business carried on here, that there are now thirteen firms who make steam-engines or mill machinery. Some of the works are more like national than private undertakings. Three houses alone employ upwards of a thousand persons in this important branch of trade.

Dr Cleland has ascertained that in Glasgow and its suburbs there are thirty-one different kinds of manufactures where steam-engines are used, and that in these and in collieries, quarries, and steam-boats, there are 355 steam-engines = 7366 horse power; average power of engines rather more than 20 horses each.

The Cotton Trade.—The manufacture of linens, lawns, cambrics, and other articles of similar fabric, was introduced into Glasgow about the year 1725, and continued to be the staple manufacture till they were succeeded by muslins. The following is a brief account of that important event.

About the year 1730 the late Mr J. Wyatt of Birmingham first conceived the project of spinning cotton yarn by machinery. The wool had to be carded in the common way, and was pressed between two cylinders, whence the bobbin drew it by means of the twist. In 1741 or 1742 the first mill for spinning cotton was erected in Birmingham; it was turned by two asses walking round an axis, and ten girls were employed in attending the work. A work upon a larger scale on a stream of water was soon after this established at Northampton, under the direction of Mr Yeoman; but nothing new had occurred in weaving till 1750, when Mr John Kay, a weaver in Bury, invented the fly shuttle. In 1760 Mr James Hargreave, a weaver at Stanhill near Church, in Lancashire, adapted the stock cards used in the woollen manufacture to the carding of cotton, and greatly improved them. By their means a person was able to double the work, and by more ease than by hand-carding. This contrivance was soon succeeded by the cylinder carding machine. It has not been ascertained who was the inventor of this valuable machine, but it is known that the grandfather of the present Sir Robert Peel was among the first who used it. In 1767 Mr Hargreave invented the spinning jenny. This machine, although of limited powers when compared with the beautiful inventions which succeeded it, must be considered as the first and leading step in that progress of discovery which carried improvement into every branch of the manufacture, changing, as it proceeds, the nature and character of the means of production, by substituting mechanical operation for human labour. The progress of invention after this was rapid. Hargreave in the mean time had removed to Nottingham, where he erected a small spinning work, and soon afterwards died in great poverty. The jenny having in a short time put an end to the spinning of cotton by the common wheel, the whole wefts used in the manufacture continued to be spun upon that machine, until the invention of the mule jenny, by which, in its turn, it was superseded. It would appear, that whilst Hargreave was producing the common jenny, Mr (afterwards Sir Richard) Arkwright, was employed in contriving that wonderful piece of mechanism the spinning frame, which, when put in motion, performs of itself the whole process of spinning, leaving to him only the office of supplying the material, and of joining or piecing the thread.

In 1769 Mr Arkwright obtained his patent for spinning with rollers, and he erected his first mill at Nottingham, which he worked by horse power. But this mode of giving motion to the machinery being expensive, he built another mill at Cromford in Derbyshire, in 1771, to which motion was given by water. Water twist received its name from the circumstance of the machinery from which it is obtained having for a long time after its invention been generally put in motion by water. The only improvement, or even alteration, yet made on Sir Richard's contrivance, the spinning frame, is the machine invented several years ago, called the throstle. Instead of four or six spindles being coupled together, forming what is called a head, with a separate movement by a pulley and drum, as is the case in the frame, the whole rollers and spindles on both sides of the throstle are connected together, and turned by bands from a tin cylinder lying horizontally under the machine; but its chief merit consists in the simplification of the apparatus, which renders the movement lighter. Besides this, the throstle can with more ease and at less expense than the frame, be altered to spin the different grists of yarn.

In the year 1775 Mr Samuel Crompton of Bolton completed his invention of the mule jenny, so called from its being in its structure and operation a compound of the spinning frame, and of Hargreave's jenny. The mule was originally worked by the spinner's hand; but in the year 92, Mr William Kelly of Glasgow, at that time manager of the Lanark Mills, obtained a patent for moving it by machinery; and, although the undisputed inventor of the process, he allowed every one freely to avail himself of its advantages. A great object expected to be obtained by this improvement was, that instead of employing men as spinners, which was indispensable when the machine was to be worked by the hand, children would be able to perform every office required. To give the means of accomplishing this, Mr Kelly's machinery was contrived so as to move every part of the mule, even to the returning of the carriage into its place after the draught was finished. But after a short trial of this mode of spinning, it was discovered that a greater amount of produce might be obtained, and at a cheaper rate, by taking back the men as spinners, and employing them to return the carriage as formerly, whilst the machine performed the other operations. In this way one man might spin two mules, the carriage of the one moving out during the time the spinner was engaged in returning the other. The process of mule-spinning continued to be conducted upon this plan until lately, when several proprietors of large cotton works restored that part of Mr Kelly's machinery which returns the carriage into its place after the draught is completed.

During the time that the machines for the different processes of cotton spinning were advancing towards perfection, Mr James Watt had applied his admirable improvements on the steam-engine to give motion to mill-work in general. His inventions for this end, besides the ingenuity and beauty of contrivance which they possess, have had an influence upon the circumstances of this country, and of mankind, far more important than that produced by any other mechanical discovery.

The foregoing application merely assisted the spinner in pushing in the carriage; to meet the more nice and difficult operations of winding the thread upon the spindle, and forming it into the proper shape of a cope, still devolved upon the spinner, and required persons of superior skill and dexterity. The wages of that class of workmen have been maintained at a higher range than in the generality of manufacturing employments. This high rate of wages has led to the contrivance of many expedients to lessen the cost of production in this process of the manufacture. About the year 1795 Mr Archibald Buchanan of Catrine, now one of the oldest practical spinners in Britain, and one of the earliest pupils of Arkwright, became connected with Messrs James Finlay and Company of Glasgow, and engaged in refitting their works at Ballindalloch in Stirlingshire. Having constructed very light mule jennies, he dispensed altogether with the employment of men as spinners, and trained young women to the work. These he found more easily directed than the men, more steady in attendance to their work, and more cleanly and tidy in the keeping of their machines, and contented with much smaller wages. That work has ever since been wrought by women, and they have always been remarkable for their stout, healthy appearance, as well as for good looks and extreme neatness of dress. Mr Buchanan having, in 1802, removed to the Catrine Works, in the parish of Lorn, Ayrshire, then purchased by James Finlay and Company, carried some female spinners with him, and there introduced most successfully the same system as at Ballindalloch. This system has from time to time been partially adopted at other works in Scotland and England, but men are still most generally employed.

The men having formed a union for the protection of their trade, as they supposed, have from time to time annoyed their employers with vexatious interferences and restrictions, which have induced a great desire on the part of the masters to be able to dispense with their employment; and this has led to several attempts to invent a set of mechanism to perform all the operations hitherto performed by men or women, thereby forming a self-acting mule. Mr William Kelly was the first to patent a machine of this description in the year 1792, as has already been stated. About the same time Mr Archibald Buchanan, of Catrine Works, then at Deanston Works in Perthshire, made an attempt to perfect a self-acting mule, but was not at that time successful. The next attempt was by Mr Eaton of Derby, who took out a patent in 1815, and fitted up a flat of his mills in Manchester soon after. The mechanism being complicated, no practical spinners ventured to give the machine a trial.

In 1825, M. de Jouge, an ingenious French gentleman, who has been long resident in this country, contrived a machine of more simple construction, for which he obtained a patent. These he had in operation at Warrington in Lancashire, and in Yorkshire; but they have never made farther progress. The spinners of Manchester and neighbourhood having been much annoyed by the union of their spinners, applied to Messrs Sharp, Roberts, and Company, celebrated machine makers, to allow their Mr Roberts, a man of great ingenuity, and of much skill and taste in mechanism, to endeavour to perfect a self-acting mule. This Mr Roberts undertook, and having devoted himself to the pursuit, succeeded, after several years of experiment, and at the expense of a large sum of money (upwards, it is said, of L.10,000), in producing a machine, which has been found to work well in the spinning of yarn not exceeding forty hanks in the pound. In the construction of this machine there is a display of great ingenuity, skill, and taste, and it has been adopted to some extent by several extensive spinners. Still, however, there are objections to these machines, on account of the complexity and expense of the mechanism; and from the peculiar style of the movements, the machine is still liable to breakage and to considerable tear and wear. About eight years ago Mr Buchanan having to renew the mules at Catrine Works, resolved to attempt again a self-actor; and, with some suggestions from his nephew Mr James Smith of Deanston Works, and with much ingenuity and perseverance on his own part, he succeeded in contriving an effective machine. He has had his whole work in operation on this plan for six years past, and, under his peculiarly good management, the machines perform very well in low numbers. In 1820 Mr James Smith of Deanston Works had contrived and constructed the mechanism of a self-acting mule; but his attention having been required to other more extensive and important operations, he laid it aside, it is believed, without trial. In 1833, Mr Smith, seeing the desire that existed for a simple and efficient self-acting mule, and more especially such as could be applied to the mules of various constructions at present in general use in the trade, set about contriving one; and having made some progress, he came to hear of a very simple contrivance for facilitating the process of backing off (one of the most difficult to accomplish in a self-actor), by John Robertson, an operative spinner, and foreman to Mr James Orr of Crofthead Mill, in Renfrewshire. Robertson, through Mr Orr, obtained a patent for his invention, which consisted of other movements, rendering the mule completely self-acting. Mr Smith, struck with the simplicity and efficacy of his backing-off movement, which consists in stripping the coils from the spindles, entered into an arrangement with Mr Orr and Robertson, and having united the mechanism of his own patent with that of Robertson and Mr Orr, they have now wrought out a machine, which is considered to be more simple and effective, and more generally applicable to all mules, than any other yet brought before the trade, and it is believed it will soon be generally adopted.

The adoption of the self-acting mules will bring the business of spinning much more under the control of the master, and will aid much in enabling the spinners of Britain to maintain a successful competition against the cheap labour of other countries, who have less capital and less facilities for obtaining these improved machines, and less skill for their management if obtained.

About six years ago Mr Smith of Deanston Works invented a very simple throstle for spinning water-twist yarn in the form of a cop, intended to facilitate the manufacture of water-twist shirting. This machine works well, and the tension of the thread in spinning is maintained by the action of two fanner's slades or wings attached to the stem of the spindle, similar to a mule spindle, and on which the cop is built, and which, from the uniform and soft resistance of the air, gives a never-varying tension. But the most wonderful improvement in water-spinning was brought to this country from the United States in 1831, by Mr Alexander Carrick, a native of Glasgow, who then obtained a patent for the invention. The inventor, a mechanic of the name of Danforth, came with the machine to this country, and it has now obtained his name, being denominated the *Danforth Throstle*. This throstle has no flies. The twisting part consists of a dead or fast spindle, on which a socket of about five inches long is fitted to revolve, and on this the bobbin for receiving the thread being spun is placed. On the top of the spindle is placed a hollow cap of one and a half to two inches diameter, which covers the bobbin; and the thread passing from the roller to the bobbin, is revolved by the motion of the socket and bobbin round the outer surface of this cap; but the centrifugal force of the thread causes it to fly out from the cap, and the only point of contact is round the edge of the mouth of the cap, when the thread passes to the bobbin. From this, and the resistance of the air to the movement of the thread, the tension is derived, and is light and uniform. The spindle of the common throstle cannot be driven to advantage above 4000 or 5000 revolutions in a minute, whilst the Danforth socket may be run with advantage at 8000 or 9000. This machine has been slowly getting into use, and suits to spin twist from tens to forties. The yarn has a medium character, betwixt water-twist and mule-twist. The power required to time this machine is great, and the tear and wear of the machine considerable. Another American throstle (which, however, was invented in Scotland thirty years ago), was introduced about four years ago by Mr Montgomerie of Johnston. It consists of a long central spindle embraced by a double-necked flur, and is said to work well, building the yarn in the form of a cop, or on a bobbin, as may be required. Several are at work about Glasgow. By these and other improvements in the various processes of cotton spinning, as much yarn can now be spun for 5s. of wages, as cost 20s. twenty-five years ago.

In the year 1797 a new machine for cleaning cotton was invented by Mr Neil Snodgrass, now (1835) of Glasgow, and first used at Johnston, near Paisley, by Messrs Houston and Company. It is called a skutching or blowing machine. Its merits were not sufficiently known till 1808 or 1809, when it was introduced into Manchester. About that period it received some improvements from Mr Arkwright and Mr Strutt, who applied a fanner to create a strong draft of air passing through a revolving wire sieve, whereby the dust and small flur separated from the cotton by the blows of the skutcher is carried off, and thrown into a chamber, where it is deposited, or into the open air out of doors, whilst the opened cotton is stopped by the sieve, and, arranging into a fleecy form of uniform thickness, passes by the revolution of the sieve to a roller, when it is wound up, to be carried to the carding engine.

The most complete arrangement of this machine was made by Mr Buchanan, of Catrine Works, in 1817, whereby the whole processes of opening, cleaning, and lapping the cotton are performed at once by a series of four skutchers, each with a sieve. The rooms in which these machines work are as free of dust as a drawing-room; and this process, at one time the most disagreeable and unwholesome, is now quite the reverse; besides, the cotton being completely freed of the dust and flur, is more cleanly in all succeeding processes, much to the comfort of the workers, and the benefit of the work.

Little improvement was made in the carding engine for many years. About 1812, however, a system of completing the carding process in one machine was introduced, and is now pretty generally adopted for numbers under fifties, and in some cases as high as eighties. In 1815, Mr Smith of Deanston Works constructed a carding engine, having the flats or tops moveable on hinges, and applied an apparatus for turning and cleaning the tops, which was the first self-topping engine, and with him the idea had originated. Two years after, Mr Buchanan arranged a more perfect machine, and had it adopted in all his water-twist mills. Some years after he farther improved this apparatus, and obtained a patent. In 1829 Mr Smith again improved the topping apparatus, by substituting a chain of successive tops, and had them made of tin plate, to avoid warping. This improvement, together with a neat and effective arrangement of cylinders forming a compact single engine, he completed in 1833, and obtained a patent.

These engines occupy about half the space of the Oldham engine much used in England, make more perfect work, and will turn off nearly two lbs. per inch of wire per day for numbers from thirties to forties. Some of the movements are extremely striking and beautiful. This machine gives promise of many advantages to the trade.

In the roving process some recent improvements have been introduced. About ten years ago Mr Henry Houldsworth junior, of Glasgow, now of Manchester, contrived a beautiful differential motion for the winding in of the rovings on the spindle and fly machine, and obtained a patent. This improvement has got much into use. About the same time a very peculiar mode of roving was introduced from America by the late Mr James Dunlop, and which was afterwards improved and patented by Mr Dyer of Manchester. This machine is called the tube machine, and has got much into use for the lower numbers of yarns. The rove coming from the drawing rollers, passes through a tube revolving at the rate of five thousand turns per minute, whereby a hard twist is thrown up to the rollers, and the roving being wound on a spool or bobbin at the opposite end of the tube, gives off all the twist, but, from the compression and rubbing it has undergone, retains a round and compact form, and has sufficient tenacity to pull round the spool or bobbin, in being drawn into the spinning machine. This machine is simple, going at a great speed, and turns off a deal of work; but it has not yet been successfully applied to any numbers above forties.

There are now many splendid spinning establishments in and around Glasgow. Those of the Lanark Company, on the Clyde, about twenty miles from Glasgow, are the most extensive in one establishment; but the three establishments of Messrs James Finlay and Company of Glasgow (of which Mr Kirkman Finlay is the head), at Catrine, Deanston, and Ballindalloch, are the most extensive ones in the whole kingdom, and employ about two thousand four hundred hands in spinning, weaving, bleaching, &c.

In reviewing the various machines which have been invented for the cotton manufacture, the result terminates in this, that one man can now spin as much cotton yarn in a given time, as two hundred could have done sixty years ago.

On the 21st of July 1834, Mr Leonard Horner, one of the parliamentary factory commissioners, reported, "That in Scotland there are 134 cotton-mills; that, with the exception of some large establishments at Aberdeen, and one at Stanley, near Perth, the cotton manufacture is almost entirely confined to Glasgow, and the country immediately adjoining to a distance of about twenty-five miles radius; and all these country mills, even including the great work at Stanley, are connected with Glasgow houses, or in the Glasgow trade. In Lanarkshire (in which Glasgow is situated) there are seventy-four cotton factories; in Renfrewshire, forty-one; Dumbartonshire, four; Buteshire, two; Ayrshire, one; Perthshire, one. In these six counties there are 123 cotton-mills," nearly 100 of which belong to Glasgow. The following statement, also from the Factory Commission Report, will give a pretty good idea of the amount of cotton trade in Glasgow: "In Lanarkshire there are seventy-four cotton, two wool, and two silk factories; seventy-eight steam-engines, namely, seventeen each of fifty horse power and upwards; eleven from forty forty-nine horse power; nine from thirty to thirty-nine rse power; nineteen from twenty to twenty-nine horse wer; twenty from ten to nineteen horse power; two der ten horse power. Water-wheels, three each of fifty rse power and upwards; two under ten horse power. Total horse power, 2914, of which steam, 2394, water, 520. Total persons employed in factories, 17,949. Of this numr, thirteen years and under eighteen years, 5047, viz. ales 1345, females 3702; under thirteen years 1651, viz. ales 756, females 895."

The increase of the cotton trade may be seen by the llowing official statement of cotton wool taken for the nsumption of Scotland from 1818 till 1834.

Years.	Bales.	Years.	Bales.
1818	46,565	1827	72,655

1826	56,117		

Cashmere Yarn.—In 1830 the weaving of Cashmere shawls in this country had become so important a branch of trade as to induce the Board of Trustees for the Encouragement of Arts and Manufactures in Scotland, to offer a premium of L.300 sterling to the first person who should establish the spinning of Cashmere wool upon the French principle in this country. Up to that time the French had exclusively enjoyed the advantages of that trade; and all Cashmere yarns, used in this country in the manufacture of shawls and other fabrics, had to be imported from France. The offer of this handsome premium, together with the other advantages which the carrying on of the trade held out, induced Captain Charles Stuart Cochrane, of the royal navy, to attempt, whilst in Paris, to find out the secret of this manufacture, which, after many difficulties and much delay, he at last accomplished, and in 1831 took out patents for the three kingdoms for the introduction of this peculiar kind of spinning. In the autumn of that year he prevailed on Messrs Henry Houldsworth and Sons of Glasgow to purchase his patents, and they accordingly commenced the spinning of Cashmere yarn. After many difficulties, they succeeded, in 1832, in making better yarn than the French; and in the following year received from the Board of Trustees the L.300 sterling as the premium due for the establishing of the spinning of Cashmere yarn in this country. Since then the manufacture has gone on but slowly, though gradually increasing in extent; and the day is not far distant when it may be hoped that the beauty of the goods made from Cashmere yarn will be duly appreciated by our ladies. One thing is gratifying, that notwithstanding the cheapness of labour in France, and the long experience the French have had in this manufacture, we are quite capable, at this moment, of successfully competing with them in the market, although the French yarns can be admitted free of duty.

Establishment of Merino Yarn Spinning in Scotland.—At the same time that the late Captain C. S. Cochrane was engaged in Paris in finding out the manufacture of Cashmere yarn, his attention was attracted by the superiority of French merino dresses over those made in this country, and on inquiry found that the peculiar manner in which the French spun the merino yarn was the principal cause of this difference. Captain Cochrane accordingly got all the information he could possibly obtain respecting this manufacture, and in 1833 established in Glasgow this peculiar mode of spinning merino yarn on the French principle. The Board of Trustees offered a premium of L.300 sterling to the introducer and establisher of this manufacture, which premium Captain Cochrane accordingly received this year, his merino yarn being pronounced equal, if not superior, to the best French yarns. After this satisfactory result the business was extended to meet the demand of the trade; but, unfortunately for the spirited introducer, death cut him short before his plans were fully brought to a profitable result. The business is in the mean time being carried on by Messrs Henry Houldsworth and Sons for the benefit of Captain Cochrane's partner; and, from the soft and beautiful goods which can be made from this yarn, almost rivalling the Cashmere itself, there seems little doubt but that in a short time, when it becomes well known, the merinos of this country will successfully compete with those of the French.

Progress of Machinery, Manufactures, and Trade.—The power-loom was introduced into Glasgow in the year 1793, by Mr James Lewis Robertson of Dumblane. It was invented by the Rev. Dr Cartwright of Doncaster, and was patented by him in 1774. About 1789 or 1790, a number of these looms were fitted up in the hulks to employ the convicts. They were driven in a manner similar to the inkle-loom, of which indeed the whole machine was a modification. Mr Robertson having been in London in 1792 or 1793, bought a couple of the looms from the hulks, and brought them to Glasgow, when they were fitted up and wrought in a cellar in Argyle Street. He removed the driving-bar, and employed a large Newfoundland dog, walking in a drum or cylinder, to drive the looms. He had an ingenious old man, William Whyte, from Denny, to manage the looms; and by a son-in-law of this man's the design of the looms was communicated to a bleaching and calico-printing establishment at Milton, near Dumbarton, in 1794, where about forty looms were fitted up there for weaving calicoes for printing. In 1801, Mr John Monteith of Glasgow got a pair of looms from Milton, and in the course of two years afterwards had 200 looms at work in a portion of his spinning establishment at Pollockshaws, near Glasgow. In 1803, Mr Thomas Johnston of Bradbury, Cheshire, invented a very beautiful and useful machine for warping and dressing warps; and some time after, Messrs Radcliff and Ross of Stockport improved the dressing machine, and obtained a patent for these improvements. This machine they also employed in dressing webs to be woven on hand-looms by boys and girls. In 1804, Mr Monteith prevailed upon Mr Archibald Buchanan of Catrine to take a pair of looms from him, urging him to improve the machine. Mr Buchanan worked these looms for a year, with a view to obtain experience on the subject; and finding the annoyance of dressing the web in the loom great, he set about contriving a dressing machine. In this machine he used cylindrical brushes, and succeeded at that time pretty well; but, from the obstinacy of the person engaged to work the machine, and his own want of knowledge in the art of dressing, he was led to abandon it. He then invented a remarkably neat and effective loom, and in 1806 proceeded to fill a large room with them, and again applied himself to contrive a dressing machine; he abandoned the cylindrical brushes, and adopted parallel moving ones, similar to those of Radcliff and Ross, and after much experiment with various success, and by the exercise of much ingenuity and perseverance, he succeeded in effecting a complete machine, and rapidly extended his looms, with the necessary dressing machines. In the year 1807 he had the first complete work in Britain, in which warping, dressing, and weaving by power, were uniformly carried on; and it may be said that from this establishment emanated the power-loom weaving of Britain.

When Mr Buchanan first began the power-loom, from seventy to eighty shots or picks per minute were considered as great speed; but, from improvements since introduced by Mr Buchanan and others, a speed of a hundred and forty shots per minute is now obtained. About this time, Messrs Foster and Corbet of Glasgow, and the Messrs Crums at Thornlie Bank, began to use power-looms. About the same time Mr Peter Manland of Stockport was the first to introduce the power-loom into England on a practical scale. In 1808 power-looms were begun at Deanston, and there in 1809 tweels, and in 1810 checks, were first woven on power-looms. In 1818 or 1819, Mr William Perry of Glasgow began the weaving of figured goods, and some time since lappets were woven by the Messrs Reids of Anderston, Glasgow. The Messrs King were the first persons celebrated for weaving strong shirting and domestics; and the Messrs Sommerville and Sons have recently introduced extensively a very superior manufacture of furniture stripes and checks, and an infinite variety of similar goods for women's dresses, shirting, &c., at their new and splendid works in Hutchesontown. Mr William Dunn of Duntocher, the most extensive and successful spinner in Scotland as an individual, has upwards of six hundred looms, upon which he executes various very beautiful plain fabrics. The power-loom is daily extending into new fields of manufacture, and it is evident that it will ultimately be the only means of weaving excepting for fabrics of very complex patterns.

Steam-looms have increased greatly of late years. In August 1831, the Lancefield Spinning Company employed 635 looms; and Messrs Johnston and Galbraith, James Finlay and Company, and William Dunn, 2405. These looms, on an average, weave fourteen yards each per day. Allowing each loom to work 300 days in a year, these four companies would throw off 10,101,000 yards of cloth, which, at the average price of 4½d. per yard, is L.189,393. 15s. per annum. The power and hand looms belonging to Glasgow amount to 47,127, viz. steam-looms, 15,127; hand-looms in the city and suburbs, 18,537; in other towns for Glasgow manufacturers, 13,463.

The extension of the use of the power-loom has for the last twenty years borne hard upon the poor hand-loom weavers, who have long suffered from low wages with exemplary patience. The evil was at first aggravated by a natural cause. When the weaver found difficulty in making wages to support his family, the only apparent remedy was to get looms for his children, girls as well as boys, and to set them to work also. This, when work was to be had, helped the individual's family, but it brought so much more weaving labour into operation in the trade, previously overstocked, that the evil was increased, and every succeeding year the prices of weaving became lower. Many attempts have been made by the hand-loom weavers to have their prices regulated by act of parliament, or boards of trade; and in this they have occasionally been aided by some well-meaning men of rank and influence, but, as might have been expected, without the least success. For why fix the wages or prices of the hand-loom weavers, whilst those of the mason, joiner, farm-servant, &c. are left to be adjusted by the constantly operating natural causes springing from demand and supply? If the prices of weaving were fixed, whenever a period of stagnation arrived, the manufacturers would either get weavers to do their work at lower prices clandestinely, or they would cease to manufacture at all, thereby throwing a great proportion of the weavers completely idle. Besides, the hand weavers had a long period of high wages, averaging far above the rates paid for labour in other more laborious and skilful professions. This arose from the rapid extension of their trade, and now, in its decline, they must be contented with the lower rate of wages, until their superabundant labour is absorbed by other trades in a state of advancement.

Glasgow was the first place in Britain where inkle-wares were manufactured. In 1732, Mr Alexander Harvey of of that city, at the risk of his life, brought away from Haerlem two inkle-looms and a workman, and was thereby enabled to introduce the manufacture of the article into this city. Soon after this, the Dutchman, considering himself as ill used by his employer, left Glasgow in disgust, and communicated his art to Manchester.

The manufacture of green bottles in Glasgow was introduced, and the first bottle-house erected on the site of the present Jamaica Street bottle-house, in 1730.

It does not appear that the art of turret-bell making was known in Glasgow till 1735. It was not however till 1813, when Messrs Stephen, Miller, and Company made the bell fo he steeple of the Gorbals Church, that large turret-bells w e made in Glasgow. Since that period they have made a eat number, which are equal in quality and tone to any th ever came from Holland. In the steeple at the Cross th e are twenty-eight bells, denominated chimes, diminishin from five feet three inches to one foot six inches in cir cu ference. The greater part of them have this inscripti : "Tuned by Arniston and Cummin, 28 Bells, for G sgow, 1735."

n 1742, Messrs Ingram and Company fitted up a printfi l at Pollockshaws. The first delft manufaetory in Scotla l was begun in Delftfield, near the Broomielaw, in 1748. M Laurence Dinwiddie, then late provost, and his brother G ernor Dinwiddie, were two of the first partners.

he first shoe-shop in Glasgow was opened in 1749, by M William Colquhoun; and in 1773 Mr George Mackinto , employing at that time upwards of 300 shoemakers fo the home and export trade, had his shoe-shop in King S ect. Mr Mackintosh had also an agent in Edinburgh, w re he employed a number of workmen. At the same pe od, the Glasgow Tan-work Company employed nearly 3 shoemakers; and to these two houses the whole expo of shoes was confined.

he haberdashery business was first introduced into G sgow about 1750, by Mr Andrew Lockhart. But alth gh Mr Lockhart was the first person who commenced th haberdashery business in this city, it was not till the au mn of 1787 that it was carried on to any considerable ex nt. At that period, Mr J. Ross of Carlisle opened a sh in Spreull's new "land," and gave the haberdashery bu ness a tone which it had never reached before in this ci . Soon afterwards, two of his shopmen, under the firm of ray and Laurie, commenced business with an extensive st k of goods; and the haberdashery business has rapidly in eased in this city since that time.

r John Blair and Mr James Inglis are supposed to have be n the first persons who had front shops for the sale of ha in this city. The shops were both opened in 1756, th former in the Saltmarket, and the latter in the Bridgeg .

he business of silversmith is of considerable standing in lasgow. Mr James Glen, who was a magistrate in 1 4, succeeded Mr Robert Luke. When the latter first o ned a shop, the trade was but little known in the west of S tland. In 1775, when Mr Robert Gray commenced bu ness, the following persons had silversmiths' shops he : Messrs Milne and Campbell, William Napier, Davi Warnock, Napier and Bain, James M'Ewen, and Adam G ham. In 1775, the assortment of plate was inconside ble; but in 1834 there are shops in Glasgow which w ld be considered as valuable in Fleet Street, and elegant in ond Street. It is not easy to ascertain when the first w llen-draper's shop was opened in Glasgow. In 1761, w n Mr Patrick Ewing entered into the trade, it was very li ted.

he Iron Trade.—Although the cotton manufacture has be the staple trade of Glasgow and neighbourhood for a lo period, the iron manufacture in its various branches w ld appear to be the one which nature points out as li y to furnish the most advantageous employment of the la ur and capital of the district, from the inexhaustible st es of the materials for the making of iron with which it al nds. The local situation of Glasgow, too, is peculiarly favourable for the cheap conveyance of the bulky and heavy articles of this manufacture to every quarter of the world. The city is about equidistant from the Atlantic and German Seas, and not more than twenty-six miles from either, communicating with the one by the river Clyde, navigable by vessels drawing thirteen feet water, and with the other by the Forth and Clyde Canal, navigable by vessels also drawing thirteen feet water. It stands at the western extremity of the district known by the designation of the Basin of the Clyde, and which, stretching eastward for about twenty-six miles, and of considerable breadth, is one uninterrupted field of coal, interspersed with bands of rich black ironstone. Into this mineral field the Monkland Canal penetrates twelve miles, having its western extremity at Glasgow communicating there with the Forth and Clyde Canal, into which it is introduced. On a parallel line with this water conveyance there is the Garnkirk and Airdrie Railway, on a part of which locomotive engines were introduced on the 2d of July 1831. The Garion-Gill Railway, which is to be connected with the Garnkirk and Airdrie Railway, and with the Monkland Canal, will carry the communication with the mineral field eight miles farther, and it is expected that the great coal field at Coltness will soon be opened up. With these advantages for obtaining the materials, and sending the manufactured article to market, Glasgow must become the seat of a great iron manufacture. She has already large establishments for the manufacture of steam-engines and machinery, and for making the machines employed in the processes of cotton-spinning, flax-spinning, and wool-spinning. In these works every thing belonging to or connected with the millwright or engineer departments of the manufacture is also fabricated. Having these important and valuable portions of the manufacture already established, and with the advantages which the district possesses for carrying on the trade, there is every reason to expect its rapid growth, and its extension to every article of iron manufacture.

Neilson's Patent Hot Blast.—An improvement of national importance has lately taken place in the making of iron, of which the following is a description. Mr James B. Neilson, engineer in this city, obtained patents in this country and France[1] for an improvement in the manufacture of iron, which he designated a Hot Blast. The patentee drew up a description of this improvement, of which the following is an abridgment.

In 1824 an iron maker asked Mr Neilson if he thought it possible to purify the air blown into blast-furnaces, in a manner similar to that in which carburetted hydrogen gas is purified; and from this conversation Mr Neilson perceived that he imagined the presence of sulphur in the air to be the cause of blast-furnaces working irregularly, and making bad iron in the summer months. Subsequently to this conversation, which had in some measure directed his thoughts to the subject of blast-furnaces, he received information that one of the Muirkirk iron-furnaces, situated at a considerable distance from the engine, did not work so well as the others; which led him to conjecture that the friction of the air, in passing along the pipe, prevented an equal volume of the air getting to the distant furnace with that which reached to the one situated close by the engine; and he at once came to the conclusion, that by heating the air at the distant furnace, he should increase its volume in the ratio of the known law according to which air and gases expand. Thus, if 1000 cubic feet, say at 50° of Fahrenheit, were pressed by the engine in a given time, and heated to 600° of Fahrenheit, it would then be increased in volume to 21,044, and so on for every thousand feet that would be blown into the furnace. In prosecuting the experiments which this idea suggested, circumstances, however, convinced him, that heating the air introduced for supporting combustion into air-furnaces would materially increase its efficacy in this respect; and, with the view of putting his suspicions on this point to the test, he instituted the following experiments: To the nozle of a pair of common smith's bellows he attached a cast-iron vessel, heated from beneath in the manner of a retort for generating gas, and to this vessel the blowpipe by which the forge or furnace was blown was also attached. The air from the bellows having thus to pass through the heated vessel above mentioned, was consequently heated to a high temperature before it entered the forge fire, and the result produced in increasing the intensity of the heat in the furnace was far beyond his expectation, whilst it made apparent the fallacy of the generally received theory, that the coldness of the air of the atmosphere in the winter months was the cause of the best iron being then produced. But in overthrowing the old theory, he had also established new principles and facts in the process of iron making; and, by the advice and assistance of Mr Charles Mackintosh of Crossbasket, he applied for and obtained a patent, as the reward of his discovery and improvement.

---

[1] In France the use of the hot blast has been adopted to an extent which contrasts singularly with the tardiness displayed by so e of the English and Welsh iron masters in regard to it, and which would seem to encourage the idea of the probability of the F ch soon outrivalling us in this important staple. In 1834, the well known engineer Monsieur Dufresnoy published an elaborate re rt in recommendation of the use of the "hot blast," by order of the minister director-general of the mines of France. From this re rt it appears that in France advantages analogous to those obtained in Scotland have resulted from the use of the "hot blast" in on making; in the kingdom of Wurtemberg this has also been the case; and its adoption in Sweden, Saxony, and the states of e king of Sardinia, bears testimony to the merits of this Scottish invention.

Experiments on the large scale to reduce iron ore in a founder's cupola were forthwith commenced at the Clyde Iron Works, belonging to Mr Colin Dunlop, and were completely successful; in consequence of which the invention of Mr Neilson was immediately adopted at the Calder Iron Works, the property of Mr William Dixon, where the blast, by being made to pass through two retorts, placed on each side of one of the large furnaces, before entering the furnace, effected an instantaneous change both in the quantity and quality of iron produced, and a considerable saving of fuel. The whole of the furnaces at Calder and Clyde Iron Works were in consequence immediately fitted up on the principle of the hot blast, and its use at these works continues to be attended with the utmost success. It has also been adopted at Wilsontown and Gartsherrie works in Scotland, and at several works in England and France. The air, at first raised to 250° of Fahrenheit, produced a saving of three sevenths in every ton of pig-iron made; and the heating apparatus having since been enlarged, so as to increase the temperature of the blast to 600° of Fahrenheit and upwards, a proportionate saving of fuel is effected; and an immense additional saving is also acquired by the use of raw coal instead of coke, which may now be adopted by thus increasing the heat of the blast, the whole waste incurred in burning the coal into coke being thus also avoided in the process of iron making. By the use of this invention, with three sevenths of the fuel which he formerly employed in the cold air process, the iron maker is now enabled to make one third more iron of a superior quality. Were the hot blast generally adopted, the saving to the country in the article of coal would be immense. In Britain about 700,000 tons of iron is made annually, of which 55,500 tons only are produced in Scotland. On these 55,500 tons his invention would save, in the process of manufacture, 222,000 tons of coal annually. In England the saving would be in proportion to the strength and quality of the coal, and cannot be computed at less than 1,320,000 tons annually; and taking the price of coals at the low rate of 4s. per ton, a yearly saving of L.308,400 sterling would be effected. Nor are the advantages of this invention solely confined to iron making. By its use the founder can cast into goods an equal quantity of iron in greatly less time, and with a saving of nearly half the fuel employed in the cold air process; and the blacksmith can produce in the same time one third more work with much less fuel than he formerly required. In all the processes of metallurgical science, it will be found of the utmost importance in reducing the ores to a metallic state.

Iron Works in Scotland in December 1834.

Erected in or about		Furnaces.	Tons.
1767	Carron Company	5	8,000
1786	Clyde	4	12,500
1786	Wilsontown	1	3,000
1790	Muirkirk	2	4,000
1790	Devon	3	7,000
1805	Calder	4	12,000
1805	Shotts	1	3,000
1825	Monkland	3	8,000
1828	Gartsherrie	3	9,000
1834	Dundyvan	2	6,000
		28	72,500
1790	Cleland	1	Out of blast.
		29	

These works are all in the neighbourhood of Glasgow excepting five, and none of them are thirty miles distant from that city. Previously to the use of Neilson's hot blast, 6000 tons of iron were made at Clyde Iron-Works in a year. In the formation of each ton of iron, eight tons of coal and fifteen tons of limestone were required. In 1833, when the hot blast was applied, the same steam-engine made 12,500 tons of iron, each ton requiring only three tons of coal and eight tons of limestone. The whole of the above iron works are using the hot blast in all their furnaces, excepting the Carron Company, who have only yet taken out a license for one of their furnaces. The best coal for making iron at the above works does not average above 4s. per ton.

Supply of Coals in Glasgow.—In 1831 it was ascertained from authentic documents, that the supply of coals came from thirty-seven coal-pits; that the quantity brought to Glasgow was 561,049 tons, and of that quantity 124,000 were exported, thereby leaving 437,049 tons for the use of families and public works in the city and suburbs. The additional consumption since the above statement was made may be fairly estimated at ten per cent. on the home consumption, and five per cent. on the export, which makes the quantity brought to Glasgow in 1834 amount to 610,953 tons. The following is the average prices of coals delivered in quantities in Glasgow during a period of eight years.

	Per Ton.
In 1821	8s. 4d. to 9s. 4d.
1822	7s. 11d. to 8s. 11d.
1823	7s. 6d. to 8s. 6d.
1824	7s. 11d. to 8s. 11d.
1825	11s. 1d. to 12s. 1d.
1826	9s. 7d. to 10s. 7d.
1827	6s. 3d. to 7s. 3d.
1828	5s. 10d. to 6s. 10d.

There has been no variation in the price of coals from 1828 to 1834. The best hard splint is laid down on the steam-boat quay at 6s. 3d. per ton.

The manufacture of flint-glass or crystal was introduced here by Messrs Cookson and Company of Newcastle in 1777, and is now carried on to a very considerable extent. In the same year, Messrs George Mackintosh and Company established the manufacture of cudbear, an article of great value in the process of dyeing; and soon after that period a number of chemical works were erected in the neighbourhood of this city. The Chamber of Commerce and Manufactures was instituted here in 1783, under the auspices of Mr Patrick Colquhoun, at that time an emigrant merchant in Glasgow. The dyeing of cottons in Turkey red having been introduced by Monsieur Papillon, Messrs George Mackintosh and David Dale entered spiritedly into the trade in 1785, and in the same year pullicate handkerchiefs were begun to be made.

The business of regular distiller is but of recent date in Scotland. Mr William Menzies of Gorbals was the first person in the west of Scotland who had a licensed still. He opened his distillery in Kirk Street in 1786; and his license was the fourth in Scotland, the houses of Messrs Stein, Haig, and another, having alone preceded him. At that period the duties amounted to about one penny per gallon, and the best malt spirit was sold at 3s. per gallon.

In 1800, Messrs Tennent, Knox, and Company, established a chemical work at St Rollox, now carried on under the firm of Charles Tennent and Company, for the manufacture of sulphuric acid, chloride of lime, soda, and soap. This manufactory, the most extensive of any of the kind in Europe, covers ten acres of ground, and within its walls there are buildings which cover 27,340 square yards of ground. In the premises there are upwards of 100 furnaces, retorts, or fire-places. In one apartment there are platina vessels to the value of L.7000. In this great concern upwards of 600 tons of coal are consumed weekly.

Messrs Henry Monteith, Bogle, and Company, established a manufactory for bandana handkerchiefs in 1802, now carried on under the firm of Henry Monteith and Company. This respectable firm also carry on the business of cotton spinning and calico printing. Their establishment at Blantyre is most extensive, while their splendid works at Barrowfield are probably unequalled in the kingdom. With the exception of an attempt on the Continent, which proved unsuccessful, the manufacture of bandanas has been chiefly confined to this city. The manufacture of silk is but in its infancy here; but the throwing and other departments of the trade bid fair for prosperity.

Gas-Light Company.—A company for lighting Glasgow with gas was incorporated by act of parliament in 1817, with a capital of L.40,000, which has been increased to L.150,000. The first street lamp was lighted with gas on the 5th September 1818; there are now upwards of 110 miles of pipes in the streets.

The works are on a large scale, and, including subsidiary establishments in different parts of the town, occupy an area of 14,831 square yards. The principal establishment now forms a square, of which one side is occupied by retorts, condensers, and other apparatus; and round the other three are ranged sheds, under which cannel coals are stored, to preserve them from moisture. These sheds are calculated to contain 6000 tons, and, to show at any time how much coal is on hand, they are divided into compartments, each containing a certain known quantity. The company have at present 152 retorts, each capable of making 5000 cubic feet of gas in twenty-four hours. Of these, a hundred and five are required in winter, and thirty in summer. The gas holders are of a very large size, and are eight in number, viz. four at the works, and four in different parts of the town. By this arrangement the pressure of gas is equalized in all portions of the city and suburbs. Cast-iron pipes to convey the gas are laid on both sides of the streets, under the foot pavements, so as not to interfere with the water-pipes, and extend to more than 100 miles in length. In generating gas for the supply of Glasgow, upwards of 9000 tons of coals are annually consumed. The coke which remains after extracting gas from cannel coal, and the tar deposited on the cooling of the gas, are used for heating the retorts, and are found to be very economical fuel. Nor is the tar the only one of the liquid products that is turned to profitable account. The ammoniacal water is sold to be used in making cudbear dye, and the naphtha in dissolving caoutchouc for manufacturing water-proof cloth. The solution of lime, after having been employed for purifying the gas, is allowed to stand until the heavier part is precipitated; this is then collected and sold for manure, and the liquor which remains (none of the gas-work refuse is allowed to run into the common sewers of the city) is evaporated under the grate bars of the retort furnace, thereby increasing the draft, and consequently the intensity of the fire.

As at other establishments, the gas is purified with lime; but in addition to this process it is made to pass through a solution of sulphate of iron, by which it is very much improved in purity. After being purified it passes through a metre of a very large size, made by Mr Crosley of London, the patentee. Here the gas manufactured is measured, and by a beautiful contrivance, called a tell-tale, which acts by the combined motions of the metre on a common clock, the quantity passing through each hour of the day or night is registered, and the extent of any irregularity in the workmen, as well as the time at which it happened, is at once detected. The company have been peculiarly fortunate in procuring the services of Mr James B. Neilson, engineer, patentee of the iron hot blast. To the scientific attainments of this distinguished manager the company are chiefly indebted for their uncommon success, and for the most perfect and beautiful establishment of the kind in the kingdom.

Messrs James and William Campbell and Company were the first who retailed soft goods in a warehouse in this city. In 1817 they commenced business in Saltmarket Street, whence they removed in 1823 to premises which they built in Candleriggs Street. The warehouses of this establishment, the largest of the kind in the king's dominions out of London, contain thirty-one thousand and three square feet of floor. In these premises the public are supplied with every kind of soft goods, and purchasers of a halfpenny lace, or a penny worth of thread, are equally attended to with those who make larger purchases. Sixty-one persons are employed in the warehouses; four of them moving about to see that the others do their duty. The following are the amount of sales during nine years: In 1818, L.41,122. 6s. 4d.; in 1824, L.156,284. 2s. 1d.; in 1827, L.183,385. 6s. 10d.; in 1829, L.227,881. 16s. 7d.; in 1830, L.250,899. 9s. 0d.; in 1831, L.275,597. 12s. 0d.; in 1832, L.312,207. 5s. 8d.; in 1833, L.367,655. 4s. 9d.; and in 1834, L.423,021. 4s. 7d. Besides these sales, the company manufacture to the value of from L.70,000 to L.80,000 of the goods they sell. Although Messrs James Morrison and Company, White and Greenwell, and Sewall and Cross of London, and Harvies and Company of Dublin, turn a much larger sum annually, Messrs Campbells serve more customers than any of these highly respectable houses.

The Tea Trade.—The Camden was the first vessel unconnected with the East India Company which brought a cargo of tea direct from Canton to Britain. She was chartered by Mr Mathieson, a Glasgow merchant, and her full cargo of Bohea, Congou, Cape Congou, Campio, and Souchong, was sold in the Royal Exchange Sale Room of this city on the 14th of November 1834. A number of London and Edinburgh merchants attended the sale.

(x. x. x.)

GLASS.

History.

The general term *glass* is employed by chemists to denote all mineral substances which, on the application of heat, pass through a state of fusion into hard and brittle masses, and which, though not always transparent, exhibit a lustrous fracture when broken. The glass of commerce, however, to which our remarks are restricted, or the transparent and artificial substance which is usually distinguished by the generic name, is produced by the igneous fusion of siliceous earth with certain alkaline earths or salts, or with metallic oxides.

The etymology of the word has been much disputed. It is derived by some from the Latin *glacies*, ice, its resemblance to which is thought to have suggested the title. Others have remarked, that the common Latin designation of this substance is *vitrum;* and as the Romans applied this term, in common with the word *glastum*, to the plant which we call woad, they have deduced it from the latter of these, either because the ashes of this plant were used in the manufacture of glass, or because it exhibited something of the bluish colour which is procured from woad. *Glassum*, the name given to amber by the ancient Gauls and Britons, has also been assigned as the origin of the word. But none of these etymons appears very satisfactory. The most plausible theory is that which derives the term from the Saxon verbs *glis-nian*, or the German *gleissen*, *splendere*, which are probably contractions of the Anglo-Saxon *ge-lixan*, to shine, to be bright. This view is in a great degree confirmed by the sense in which the term glass and its derivatives are employed by our older writers, who frequently apply it to shining or glittering substances, without reference to colour or transparency. The discussion of this point, however, as will be easily seen, is of very little importance.

The origin of the manufacture of glass is involved in the most impenetrable obscurity, and has occasioned much learned, but, at best, doubtful speculation. The art is undoubtedly of the highest antiquity. Some even assert that it was coeval with the art of pottery or brickmaking. But this is only a conjectural supposition, founded chiefly on the fact, that it is impossible to excite a strong fire, such as is necessary in metallurgic operations, without vitrifying part of the bricks or stones of which the furnace is built. But it is more than likely, that such imperfect vitrifications might have been observed long before the idea occurred of taking advantage of the effects which they displayed, in manufacturing the useful article of which we are now about to treat. There can be no doubt that the art of making glass was well known to the Egyptians. Glass beads and other ornaments made of that substance, skilfully manufactured and beautifully coloured, have been found adorning many of their mummies which are known to be upwards of three thousand years old. Neri adduces a passage from the book of Job (chap. xxviii. verse 17), to prove that glass was known to the Jews at the time when that book was written. But, unfortunately for his theory, the word which, following the Vulgate and the Septuagint, he translates *glass*, and which in our version is rendered *crystal*, means simply, in the Hebrew root, any diaphanous or shining substance, and is often used, according to the fancy of translators, to denote any body which is beautiful or transparent. The two problems of Aristotle, "Why do we see through glass?" and "Why is glass malleable?" if genuine, which is very doubtful, comprise the earliest mention of the substance on record. The ὕελος of Herodotus, which he describes as used by the Ethiopians in their cemeteries, has been variously interpreted amber or rock crystal. Both meanings are, however, questionable; and it is plain he refers to a natural, not an artificial production; for he speaks of it as being dug up in large quantities. The same word is used by Aristophanes, a writer of the same century (the fifth before Christ), in his *Nubes;* but, in the passage referred to, it may mean any stone which will permit the transit of the sun's rays to form a burning medium; and though it is by some thought improbable that glass would have been called a stone, it is yet worthy of remark that Shakspeare applies the same epithet to it in his King Lear, act v. sc. iii. Theophrastus, who flourished not above a century after Aristotle (303 A. C.), speaks of the sand of the river Belus as used in the manufacture of glass, which he certainly distinguishes by the name ὕελος; and from that date the knowledge of the substance seems to have been pretty generally diffused. A century afterwards we hear of Archimedes having employed burning glasses, amongst other instruments, for the defence of Syracuse against the assaults of the Romans under Marcellus, by means of which he set the enemy's ships on fire. The silence of Polybius, Plutarch, and Livy, as to this circumstance, may be held to argue against its accuracy; but modern experiments have shown, that it may not be wholly a fabrication, worthy only to be classed in that ample category of marvels, which

> ——— Græcia mendax
> Audet in historia.

Buffon constructed a burning glass composed of about four hundred glass planes, each six inches square, so as to form a concave mirror capable of melting silver at the distance of fifty feet, and lead and tin at the distance of one hundred and twenty feet, and of igniting wood at the distance of two hundred feet. This has rendered the feat of the "Isthmiacis decus immortale colonis," as he is styled by Silius Italicus, less incredible than it appeared before; but yet it is not impossible that his burning mirror was composed of polished steel. If the statement as to the celebrated sphere of the same philosopher having been constructed of glass can be relied on, the art of manufacturing glass must have been carried to a high degree of excellence upwards of two centuries before the Christian era.

A passage in Pliny, which attributes the discovery of glass to accident, has often been quoted. A merchant vessel, laden with nitre or fossil alkali, was driven ashore on the coast of Palestine, near the mouth of the river Belus, a small stream running from the foot of Mount Carmel in Galilee, into the Mediterranean. The mariners, unable to procure stones to rest their cooking vessels upon, used pieces of their cargo instead. The fire reduced the alkali to a soft state, and incorporating with the river sand, it melted down into a vitreous stream. The circumstance was communicated to the inhabitants of the district, who availed themselves of the hint, and engaged in the manufacture of glass. The story is plausible, and it is no extravagant credulity to believe, that the world has been indebted for this, as well as for many other of its most valuable discoveries, to what, in common language, is called accident. It is certain, however, from passages in the works of Strabo and Josephus, that the sand for about half a mile round the mouth of the river Belus was peculiarly adapted to the manufacture of glass. In fact, it was much used in the glass-houses of Tyre and Sidon. Some antiquaries maintain that the first glass-house was erected at Diospolis, the ancient capital of the Thebaid; but that distinction is generally considered as belonging to the above-mentioned towns. Alexandria, another city of the Phœnicians, was long and highly celebrated for its glass, and at one time nished great part of the glass ware which was used at ome. To these places the art was exclusively confined some centuries. The expense of the manufacture obably prevented an extensive use of the substance, and application to the ordinary domestic purposes which it w serves. It was considered as an article of luxury, and peared chiefly in the form of urns or drinking cups. hese latter were often of the most elaborate workmanip, and exquisitely embellished with raised, chased, or namented figures. The cups and cinerary urns which ve survived the shock of time and accident, prove that e ancients possessed great skill in glass-blowing, and e marked by a delicacy of workmanship which modern has not excelled. The Barberini or Portland vase, mposed of deep-blue glass, with figures of a delicate ite opaque substance raised on it in relief, is a splendid ecimen of ancient skill in this department. It was und in the tomb of Alexander Severus, who died A. D. 5. Several other ancient glass vessels of great beauty e preserved in the British Museum.

Though extensively used by the Romans, we do not d any mention of glass in any of their writers before cretius. From the allusions to its lustre and transpancy which occur in the writers of the Augustan age, ass would seem to have been then manufactured in conlerable purity. But, perhaps, the word usually transed glass may rather refer to some natural production. r, though we know that an excellence in colouring glass s attained at an early period, which has never been rpassed, yet the art of producing it devoid of colour, e most difficult process in glass-making, since it is easi- affected by extraneous substances, was then scarcely own. Many years afterwards, the Emperor Nero paid 00 sestertia, or about L.50,000 of our money, for two all drinking cups with handles, the chief excellence of ich consisted in their being colourless. The glass in mmon use was of very inferior quality, and composed r the most part of coarse thick metal, sometimes white, t generally of a bluish colour.

From the circumstance of coloured glass beads and ulets having been found in druidical remains in this untry, it has been argued by Pennant and others, that e art of making glass was known in Britain before its vasion by the Romans. It can hardly, however, as we ink, be believed, that a people, who had made very trifl- g advances in civilization, and who, it is known, were tirely unacquainted with any other art, should be found t only conversant with the manufacture of glass, a comicated and highly ingenious process, but should excel in ; for the beads and amulets spoken of are of exquisite rkmanship, and beautifully coloured in imitation of the rest and most precious stones. There seems little ubt, therefore, that the ancient Britons procured these the course of traffic with the Syrians, who visited the and, as we do those in the South Seas, to drive a trade th their savage inhabitants in toys and trinkets, giving em these in exchange for skins or other natural producns. By whatever means, however, these ornaments came to Britain, it is certain that they were in extensive use, ough principally for religious purposes, long prior to e Roman invasion, as they are found in barrows or tuuli of a much older date. One at Stonehenge, in parcular, on being opened, was found to be filled with them. Glain Neidyr, or druidical glass rings, generally about lf as wide as our finger rings, but much thicker, have equently been found. The vulgar superstition regarding ese was, that they were produced by snakes joining their ads together and hissing, when a kind of bubble like a g was formed round the head of them, which the others, ntinuing to hiss, blew on till it came off at the tail, when immediately hardened into a glass ring. Success was thought to attend any one who was fortunate enough to find one of those snake stones. They were evidently beads of glass employed by the Druids, under the name of charms, to deceive the vulgar. They are usually of a green colour, but some of them are blue, and others variegated with wavy streaks of blue, red, and white.

Glass utensils have been found in Herculaneum, which city was destroyed by an eruption of Mount Vesuvius in the reign of Titus (A. D. 79). A plate of glass also found there has occasioned much speculation as to its uses. Similar plates, to which Pliny gives the name of *vitreæ cameræ*, seem to have been employed in a manner not very well understood by us, as wainscotting for their rooms. It is disputed whether or not glass was used in Herculaneum for windows.

In the reign of Tiberius, a company of glass manufacturers established themselves in Rome, and had a street assigned them near the Porta Capena. The articles of their manufacture were few in number and of inferior quality, neither did they make rapid improvements in their art, notwithstanding the large prices which were then given for glass of foreign manufacture in the imperial city. In the year 220, they had increased so much in importance, and the produce of their manufacture was so considerable, that an impost was laid on it by Alexander Severus. Dion Cassius and Petronius Arbiter concur in their account of the discovery of malleable or ductile glass by a celebrated Roman architect, whose success in the restoration to its position of a portico which leaned to one side, had roused the envy and jealousy of Tiberius, and occasioned his banishment from Rome. Thinking that his discovery would disarm the emperor's wrath, the artist appeared before him bearing a glass vessel, which he dashed upon the ground. Notwithstanding the violence of the blow, it was merely dimpled, as if it had been brass. Taking a hammer from his breast, he then beat it out into its original shape; but instead of giving him the reward which he had expected, the emperor ordered the unfortunate artisan to be beheaded, remarking, that if his discovery were known, gold would soon be held of as little value as common clay. This is probably another version of the story told by Pliny, of an artificer who made the same discovery, and whose workshop was demolished by those who had an interest in preventing the introduction of an article which would lower the value of gold, silver, and brass. Although it might not be justifiable to give unqualified disbelief to these stories, yet the knowledge we at present possess would restrict the possibility of such a discovery within the narrowest limits. The union of the properties of malleability and vitrification seems to be incompatible. Some metallic substances, by the application of intense heat, are reduced to the state of glass, but at the same time lose their malleability; which fact would seem to imply that it is impossible to communicate the latter property to glass. The extraordinary stories above mentioned have, however, been rationally enough explained by modern chemists. It has been observed by Kunckel, that a composition having a glossy appearance, and sufficiently pliant to be wrought by the hammer, may be formed; and by Neumann, that, in the fusion of muriate of silver, a kind of glass is formed, which may be shaped or beaten into different figures, and may be pronounced in some degree ductile. Blancourt, in his *L'Art de la Verrerie*, mentions an artist who presented a bust of ductile glass to the Cardinal Richelieu, minister of Louis XIII. But he does not seem to have been more fortunate than his predecessors; for he was doomed to imprisonment for life, for "the politic reasons," as Blancourt with much simplicity observes (we quote from the translation published in 1699), "which, it is believed, the cardinal entertained from the consideration of the consequences of that secret," which no doubt led him to fear lest the established interests of French glass manufacturers might be injured by the discovery. From expressions used by Blancourt in other parts of his work, we think, that by malleable glass, such as was produced by this artist, he understood some composition similar to those which Kunckel and Neumann discovered, and was not very exact in limiting the term to that vitreous substance which we now generally understand when we speak of glass.

The precise period at which the making of window-glass came into practice is not now certainly known. The Roman windows were filled with a semitransparent substance, called *lapis specularis*, a fossil of the class of talcs, which readily splits into thin smooth laminæ or plates. This substance is found in masses of ten or twelve inches in breadth, and three in thickness; and, when sliced, very much resembles horn, instead of which it is to this day often employed by lantern makers. The Romans were chiefly supplied with this article from the island of Cyprus, where it abounds. So good a substitute for glass is it said to have been, that, besides being employed for the admission of light into the Roman houses, it was also used in the construction of hot-houses, for raising and protecting delicate plants; so that, by using it, the Emperor Tiberius had cucumbers at his table throughout the whole year.

There is no positive mention of the use of glass for windows before the time of Lactantius, at the close of the third century. But the passage in that writer which records the fact (*De Opif. Dei*, cap. 8), also shows that the *lapis specularis* still retained its place. Glass windows are distinctly mentioned by St Jerome, as being in use in his time (A. D. 422). A century later, the windows of the church of St Sophia at Constantinople are represented by Paulus Silentiarius as being filled with glass. After this period we meet with frequent mention of them. Joannes Philippinus (A. D. 630) states that glass was fastened into the windows with plaster.

The Venerable Bede asserts that glass windows were first introduced into England in the year 674, by the Abbot Benedict, who brought over artificers skilled in the art of making window-glass, to glaze the church and monastery of Wearmouth. Other authorities attribute the introduction of this luxury to Bishop Wilfred junior, who died in 711. It would thus appear, that glass windows were first introduced into England either about the end of the seventh or the beginning of the eighth century. The use of window-glass, however, was then, and for many centuries afterwards, confined entirely to buildings appropriated to religious purposes; but in the fourteenth century it was so much in demand, though still confined to sacred edifices and ornamental purposes, that glazing had become a regular trade. This appears from a contract entered into by the church authorities of York Cathedral in 1338, with a glazier to glaze the west windows of that structure; a piece of work which he undertook to perform at the rate of sixpence per foot for white glass, and one shilling per foot for coloured. Glass windows, however, did not become common in England till the close of the twelfth century. Until this period they were rarely to be found in private houses, and were deemed a great luxury, and a token of great magnificence. The windows of the houses were till then filled with oiled paper, or wooden lattices. In cathedrals, these and sheets of linen supplied the place of glass till the eighth century; in meaner edifices lattices continued in use till the eighteenth.

The glass of the Venetians was superior to any made elsewhere, and for many years commanded the market of nearly all Europe. Their most extensive glass-works were established at Murano, a small village in the neighbourhood of Venice; but the produce was always recognised by the name of Venetian glass. Baron von Lowhen, in his *Analysis of Nobility in its Origin*, states that, "so useful were the glass-makers at one period in Venice, and so great the revenue accruing to the republic from their manufacture, that, to encourage the men engaged in it to remain in Murano, the senate made them all burgesses of Venice, and allowed nobles to marry their daughters; whereas, if a nobleman marries the daughter of any other tradesman, the issue were not reputed noble."

The skill of the Venetians in glass-making was especially remarkable in the excellence of their mirrors. Beckmann, who has minutely investigated the subject, is of opinion that the manufacture of glass mirrors certainly was attempted, but not with complete success, in Sidon, at a very early period; but that they fell into disuse, and were almost forgotten until the thirteenth century. Previously to this period, plates of polished metal were used at the toilette; and in the rudeness of the first ideas which suggested the substitution of glass, the plates were made of a deep black colour to imitate them. Black foil even was laid behind them, to increase their opacity. The metal mirrors, however, remained in use long after the introduction of their fragile rivals, but at length they wholly disappeared; a result effected chiefly by the skill of the Venetians, who improved their manufacture to such a degree that they speedily acquired a celebrity which secured an immense sale for them throughout all Europe.

From Italy the art of glass-making found its way into France, where an attempt was made, in the year 1634, to rival the Venetians in the manufacture of mirrors. The first essay was unsuccessful, but another, made in 1665, under the patronage of the celebrated Colbert, in which French workmen, who had acquired a knowledge of the art at Murano, were employed, had better fortune. But a few years afterwards, this establishment, which was situated in the village of Tourlaville, near Cherbourg, in Lower Normandy, was also threatened with ruin by a discovery, or rather improvement, in the art of glass-making, effected by one Abraham Thevart. This improvement consisted in casting plates of much larger dimensions than it had hitherto been deemed possible to do. Thevart's first plates were cast at Paris, and astonished every artist by their magnitude. They were eighty-four inches long and fifty inches wide, whereas none previously made exceeded forty-five or fifty inches in length. Thevart was bound by his patent to make all his plates at least sixty inches in length and forty in breadth. In 1695 the two companies, Thevart's and that at Tourlaville, united their interest, but were so unsuccessful, that, in 1701, they were unable to pay their debts, and were, in consequence, compelled to discharge most of the workmen, and abandon several of their furnaces. Next year, however, a company was formed, under the management of Antoine d'Agincourt, who re-engaged the discharged workmen; and the works realised considerable profits to the proprietors, a circumstance which is attributed wholly to the prudent management of D'Agincourt.

Early in the fourteenth century the French government made a concession in favour of glass-making, by decreeing, that not only should no derogation from nobility follow the practice of the art, but that none, save gentlemen, or the sons of noblemen, should venture to engage in any of its branches, even as working artisans. This limitation was accompanied by a grant of a royal charter of incorporation, conveying important privileges, under which the occupation became eventually a source of great wealth to several families of distinction.

It has been said that the manufacturing of window-glass was first introduced into England in the year 1557. But a contract, quoted by Horace Walpole, in his *Anecdotes of Painting*, proves that this article was made in England upwards of a century before that period. This curious document is dated in 1439, and bears to be a contract between the Countess of Warwick and John Prudde of Westminster, glazier, whom she employed, with other tradesmen, to erect and embellish a magnificent tomb for the earl, her husband. John Prudde is thereby bound to use "no glass of England, but glass from beyond seas;" a stipulation which, besides showing that the art of making window-glass was known and practised in England in the fifteenth century, seems also to indicate that it was inferior to what could be obtained from abroad. The finer sort of window-glass was made at Crutched Friars, London, in 1557. The first flint-glass made in England was manufactured at the Savoy House, in the Strand; and the first plate-glass, for looking-glasses, coach windows, and similar purposes, was made at Lambeth, by Venetian workmen, brought over in 1670 by the Duke of Buckingham.

The art of glass-making was introduced into Scotland in the reign of James VI. An exclusive right to manufacture it within the kingdom, for the space of thirty-one years, was granted by that monarch, to Lord George Hay, in the year 1610. This right his lordship transferred in 1627, for a considerable sum, to Thomas Robinson, merchant-tailor in London, who again disposed of it for L.250, to Sir Robert Mansell, vice-admiral of England. The first manufactory of glass in Scotland, an extremely rude one, was established at Wemyss in Fife. Regular works were afterwards commenced at Prestonpans, Leith, and Dumbarton. Crown-glass is now manufactured at Warrington, St Helens, Eccleston, Old Swan, and Newton, Lancashire; at Birmingham, Hunslet near Leeds, and Bristol. It is also manufactured of excellent quality on the Tyne and Wear. Great improvements have recently been made in the manufacture of crown-glass; and we believe this article, as made in England, is superior in quality to that of any other nation.

There is good reason for supposing that the art of staining or painting glass is coeval with the art of making glass itself, since, as has been noticed above, it is difficult to make it without colour. The possibility of subjecting this propensity to the will of the manufacturer must have very obviously presented itself, although it certainly requires much art and chemical knowledge to produce perfect specimens of this description of manufacture. This perfection seems, however, to have been attained at a very early period. It is certain that the art was known in Egypt at least 3000 years ago. We have already mentioned the beautiful imitations of precious stones, found adorning mummies which are known to have existed for that time. We meet with frequent mention of specimens of Eastern workmanship of consummate beauty, upon which great value was placed. The Emperor Hadrian, whilst at Alexandria, was presented by an Egyptian priest, with two glass cups, which sparkled with colours of every kind, and which had been used in the service of the temple. These he prized so highly that he ordered that they should be produced only on festivals and great solemnities. The works of Caylus and Winkelmann furnish some striking instances of ancient skill in the formation of pictures by means of delicate glass fibres of various hues, which, after being fitted together with the utmost nicety, were conglutinated by fusion into a solid mass. The art of combining the various colours, so as to produce pictures, such as is now practised, is comparatively of recent date. The earliest specimens of this kind of work discover a factitious joining of different pieces of glass, differently tinged, and so arranged as, by a species of mosaic work, to produce the figure or figures wanted. The various pieces are held together generally by a vein of lead, run upon the back of the picture, precisely at their junction.

But modern ingenuity has superseded this clumsy expedient; and every colour used in painting can now be introduced into one entire sheet. For a long period the pictured glass used in cathedrals was merely painted on the surface, the art of incorporating the colours with the glass by fusion, the method now practised, being unknown till the beginning of the fifteenth century. This great improvement is ascribed to a painter of Marseilles, who went to Rome during the pontificate of Julius II.; but his discovery went no further than the producing of different colours on different pieces of glass, and having them afterwards united in the old fashion. This art was, at a later period, greatly improved by Albert Durer and Lucas of Leyden, the latter of whom brought it nearly to the state in which it is now practised.

The first painted glass executed in England was in the time of King John; previously to this, all stained or painted glass was imported from Italy. The next notice of it occurs in the reign of Henry III. The treasurer of that monarch orders that there be painted, on three glass windows in the chapel of St John, a little Virgin Mary holding the child, and the Trinity, and Saint John the Apostle. Some time after, he issues another mandate for two painted windows in the hall.

Even at this early period, however, England boasted of eminent native artists in glass painting, amongst the first of whom was John Thornton, glazier of Coventry. This person was employed, in the time of Henry IV., by the dean and chapter of York cathedral, to paint the eastern window of that splendid edifice; and for the beautiful and masterly workmanship which he exhibited in this specimen of his skill, he received four shillings per week of regular wages. He was bound to finish the work in less than three years, and to receive, over and above the weekly allowance, one hundred shillings for each year; and if the work was done to the satisfaction of his employers, he was to receive, on its completion, a further sum of L.10.

From this period downwards there have been many skilful native artists, although the Reformation greatly impeded the progress of the art, by banishing the ungodly ostentation of ornamented windows from churches; indeed, so serious was this interruption, that the art had nearly altogether disappeared in the time of Elizabeth. Amongst the most eminent glass painters who first appeared upon the revival of the art, were Isaac Oliver, born in 1616, and William Price, who lived about the close of the seventeenth century. This last person was for many years the only glass painter in England. He is said to have discovered, what is to this day a desideratum in the art of glass staining, the secret of producing a rich, clear, bright, and transparent red, the most difficult to strike, and the most expensive of all the colours employed in glass painting. But Price having died soon after making this discovery, his secret died with him. This artist was succeeded by a person at Birmingham, who, in 1757, fitted up a window for Lord Lyttleton, in the church of Hajely. To him succeeded one Peckit of York, who attained considerable eminence in the art.

During all this time, however, and indeed until a comparatively recent date, painted glass was regarded as too costly and too magnificent an article to be otherwise employed than in decorating religious edifices or the palaces of nobles; and even in the latter case it was but sparingly used. Modern improvement has now placed this beautiful ornament within the reach of very ordinary circumstances; and, when this is considered, it must excite a strong feeling of surprise to find how little so elegant a luxury is even yet in demand. The art of staining glass is now practised with very great success. The colours of modern artists, we venture to allege, notwithstanding what is often urged to the contrary, equal in variety and richness those of the ancients; and, with the superior knowledge which we now possess of the principles of drawing, and of bringing several colours together on a single sheet, encouragement alone is wanting to attract artists of talent and inventive genius to the pursuit of the art, and to carry it to a greater height of excellence than it has ever reached in the hands of their predecessors.

MANUFACTURE OF CROWN-GLASS.

In order to secure success to his operations, the glass manufacturer must bestow the utmost care upon the erection of his furnaces. They must be well and substantially built, of the best materials, of the most approved construction, and under the direction of a builder of tried skill and extensive experience. A false economy in these respects cannot fail of leading to the most ruinous results.

Crown-glass is the best kind of glass now employed in the glazing of windows, and is so called to distinguish it from the common, broad, or spread glass, which was in use before the introduction of crown-glass, but which, on account of its inferior quality, is now rarely used. In the manufacture of crown-glass the following furnaces and arches are required, viz. calcar arch, main furnace, bottoming hole, flashing furnace, nose hole, and annealing kiln.

A Calcar Arch for burning frit is a common reverberatory furnace, and is about ten feet long, seven feet wide, and two feet high. A building ground plan and elevation of one is shown in Plate CCLXVI. figs. 4 and 5. The crown and sides are built of fire-brick, and the other parts of common brick. The bottom should be carefully joined and cemented, as the salt is apt to ooze through it.

The Main or *Glass-making Furnace* is an oblong square, built in the centre of a brick cone, large enough to contain within it two or three pots at each side of the grate-room, which is either divided, as shown in the plan, or runs the whole length of the furnace, as the manufacturer likes. Plate CCLXVI. fig. 3 is a ground plan, fig. 2 is an end elevation, and fig. 1 a front elevation, of a six-pot furnace. 1, 2, 3, fig. 1, are the working holes for the purpose of ventilation, for putting in the materials, and for taking out the metal to be wrought. 4, 5, 6, 7 are pipe holes for warming the pipes before beginning to work with them. 8, 9, 10 are foot-holes for mending the pots and sieges. 11 is a bar of iron for binding the furnace, and keeping it from swelling.

The arch, as shown in fig. 2, is of an elliptic form. A barrel arch, that is, an arch shaped like the half of a barrel cut longwise through the centre, is sometimes used. But this soon gives way when used in the manufacture of crown-glass, although it does very well in the clay-furnace for bottle-houses.

The best stone for building furnaces is fire stone from Coxgreen, in the neighbourhood of Newcastle. Its quality is a close *grec*, and it contains a greater quantity of talc than the common fire stone, which seems to be the chief reason of its resisting the fire better. The great danger in building furnaces is, lest the cement at the top should give way with the excessive heat, and, by dropping into the pots, spoil the metal. The top should therefore be built with stones only, as loose as they can hold together after the centres are removed, and without any cement whatever. The stones expand and come quite close together when annealing; an operation which takes from eight to fourteen days at most. There is thus less risk of any thing dropping from the roof of the furnace.

The inside of the square of the furnace is built either of Stourbridge fire-clay annealed, or the Newcastle fire-stone, to the thickness of sixteen inches. The outside is built of common brick about nine inches in thickness.

The furnace is thrown over an ash-pit, or cave as it is called, which admits the atmospheric air, and promotes the combustion of the furnace. This cave is built of stone until it comes beneath the grate-room, when it is formed of fire brick. The abutments are useful for binding and keeping the furnace together, and are built of masonry. The furnaces are stoutly clasped with iron all round, to keep them tight. In four-pot furnaces this is unnecessary, provided there be four good abutments.

Bottoming Hole. Plate CCLXVII. figs. 3 and 4. Elevation and ground plan. The interior is of common fire-brick, the mouth either of common fire-brick or Stourbridge clay, and the outside entirely of common brick.

Flashing Furnace. Figs. 5 and 7. Elevation and ground plan. The outside is built of common brick, the inside of fire-brick, and the mouth or nose of Stourbridge fire-clay.

Nose Hole. Fig. 6. Elevation. This is a small aperture off the flashing furnace, and of the same materials. Fig. 7, ground plan.

Annealing Kiln. Figs. 8 and 9. It is built of common brick, except around the grate-room, where fire-brick is used.

The materials of which crown-glass is usually composed are kelp and fine white sand. Pearl ashes, or certain other alkalis, sometimes supply the place of the former of these substances. The quality of kelp is extremely various. That from Orkney is superior to what is made in Ireland, the Hebrides, or the lower parts of Scotland. It is found to contain less alkali, and to produce glass of a better colour.[1] For the glass-maker's purposes the kelp of the Orkneys is decidedly the best. It is freer from sulphur than the others, the presence of which makes the glass green, crude, and fretful. The following is the course pursued in the preparation of kelp. The fuci are cut from the rocks in the months of May, June, and July. They are then brought to the shore, and, after being spread out and dried, are thrown into a pit lined with stones, in which a large fire of peat has been previously kindled. On this fire the weed is heaped from time to time, until a large mass is accumulated, and the whole is reduced to a state of fusion. It is then well mixed and levelled, and allowed to cool. When sufficiently cold, it is taken from the pit, and broken into portable masses, for the convenience of transportation. To prevent the dissipation of the alkali, a thing very apt to occur, the greatest care is necessary in every part of this process; in the gathering and drying, as well as in the burning of the fuci; in the treatment of the mass whilst in a state of fusion; and in its exposure to the atmosphere during these operations. Kelp burners are but too frequently guilty of carelessness in this respect. In some places they burn the fuci in pits which are not lined with stones, and, of consequence, sand and earthy substances mingle with the fused mass.[2] It is no uncommon thing for the makers to increase the weight of kelp intentionally, foolishly thinking to procure a high-

---

[1] Some eminent chemists assert that, although the usual quantity of kelp be added in the manufacture of glass, the weight of the glass produced is nothing more than the original weight of the sand. But this is not the case with the Orkney kelp, for though it has less alkali, it contains more insoluble matter than the West Highland kelp, and of course produces a larger quantity of glass. The West Highland yields glass of very inferior colour to that procured by the use of Orkney kelp.

[2] The best mode of preparing kelp, as invented by Colonel Fullarton, is by burning it in a reverberatory furnace, and throwing it down in the form of cakes, in the same manner as frit, which we shall afterwards have occasion to describe. When so prepared, it is more fit for the glass manufacturer, being free of extraneous matter. This method is now employed by extensive makers of kelp in Ireland.

Crown-Glass.

er price for it by so doing. Such adulteration is, however, at once detected by the kelp merchant, and the article, which might otherwise have brought a good price, is reduced to less than a third of its value. The inferiority of the Lowland kelp to that of Orkney and the Hebrides, may with safely be attributed as much to this practice as to the inferiority of the fuci. Some idea, but at best a very uncertain one, of the quality of kelp may be formed by the examination of its external appearance. A chemical analysis of its properties can alone give security to the manufacturer. In preparing it for the manufacture of glass, it is first broken into small pieces, either by the hand or by a machine called a stamper. It is then put into a mill and ground into a fine powder, stones and all other extraneous matter being picked out. The powder is afterwards passed through brass wire sieves.

With regard to the other component part of window-glass, namely, sand, that of the best description is procured from Lynn Regis, in Norfolk. That procured from Alum Bay, on the western coast of the Isle of Wight, is also of excellent quality. The superiority of this sand arises from the circumstance of its containing a greater quantity of minute transparent crystals than is found in the sand of any other place in the country. In preparing the sand, it is usually washed in a large vat with boiling or cold water, until the water runs off quite clear. The sand is then put into a calcining arch, where it is subjected to a strong heat for twenty-four hours. During this time it is kept red hot, and immediately on being taken out is plunged into pure cold water. This has the effect of dividing the particles of sand, and making it unite more readily with the alkali during the process of calcining. Some use nitre during this process, which consumes any sulphureous matter that may be present, or extraneous substances of an animal or vegetable nature, and reduces them to an earth not injurious to glass. When this operation is completed, it is removed into the mixing room, where the proportions of material are adjusted and mingled together, previously to their being *fritted* or calcined. Here the materials, the sand and the kelp powder, are carefully proportioned, generally in the degree of eleven of kelp to seven of sand, some manufacturers using eleven to eight, which are mixed up according to the judgment of the mixer. The majority of glass manufacturers are now giving up the use of kelp. Within the last few years the improvements in the manufacture of carbonate of soda have been very great, while it has also fallen considerably in price. Instead, therefore, of using such an impure alkali as kelp with sand, carbonate of soda with sand and lime is employed, which gives glass of as good a colour as plate, and is attended with many other advantages which the old materials do not possess. Manufacturers, instead of kelp, purchase sulphur, and with it make sulphuric acid. With sulphuric acid and muriate of soda they make sulphate of soda, to which lime, coal, &c. are added, and thus produce carbonate of soda, which, with sand and lime, is made into glass. The operations for preparing these materials are carried on within their own premises by several extensive glass manufacturers. The following mixture has been found to produce an excellent quality of glass:—3 cwts. Lynn sand; 2½ ditto carbonate of soda; 14 lbs. nitre; 14 ditto lime; 7 ditto charcoal; one fourth of the above weight of cullet.

This mixture will make a very excellent glass when the furnace is kept at a proper heat. The proportions must, of course, be regulated in some degree by the heat which the furnace attains. The addition of any other ingredient will injure the quality and colour of the glass. It may be either fritted or not before being put into the pots. The use of this mixture saves coals, time, and wages, as the founding occupies from sixteen to twenty hours only, whilst in other cases the time occupied by this process is from twenty to twenty-four hours. It can also be blown to a thinner and finer substance, and is thus liable to a less duty. When the sand and kelp are thoroughly mixed, the compost is put into a calcining arch or reverberatory furnace, where it is subjected to a heat so strong as to reduce it to a semifluid state. Whilst in this state, it is stirred without intermission, to prevent the formation of knots containing more sand than the rest of the batch, an effect resulting from the dissipation of the alkali by excess of heat. The process of calcining requires more or less time according to the varying properties of the ingredients composing the batch. From three to four hours is the time usually occupied by each batch. The frit, as the substance is now called, is taken from the furnace, spread upon a plate of iron whilst yet hot, and, before it becomes quite cold, divided into large cakes. In the opinion of many, it cannot be too old for use; as when new the glass made from it is full of what are called seeds. It is commonly kept about six months by opulent manufacturers. The last operation consists in throwing the frit into the melting pots, which are of the form represented in Plate CCLXVIII. fig. 2.

To prevent stones or clay from the furnace falling into the pot, those used in making flint-glass are always covered in on the top; and the same thing has been tried in crown pots, made with two openings, one in the front and one in the back, the back one to be plugged up when beginning to work from the front of the pot. This method succeeded very well, but was abandoned from the length of time it required; a circumstance which more than counterbalanced its advantages.

These pots or crucibles are made of the finest clay. That from Stourbridge in Worcestershire is considered the best. Great care is requisite in the selection, and in cleansing it from extraneous particles, the presence of which, even in the smallest degree, will injure the pot. A fine powder procured by grinding old crucibles is generally mixed, in a proportion seldom larger than a fourth, with what is termed the virgin clay. This mixture dries more rapidly, contracts less while drying, and presents a firmer resistance to the action of the fire and alkali used in the composition of glass than the mere unmixed clay. These ingredients having been mixed, they are wrought into a paste in a large trough, and carried to the pot loft, covered in such a way as to exclude dust and other minute particles. Here a workman kneads this paste by tramping it with his naked feet, turning it from time to time until it becomes as tough as putty. It is then made into rolls, and wrought, layer upon layer, into a solid and compact body, every care being taken to keep it free of vacuities, as latent air would, by its expansion in the furnace, cause an immediate rupture of the pots.

After pots are made, very great care is necessary to bring them to the proper state of dryness before taking them to the annealing or pot arch. In drying they commonly shrink about two inches in the circumference. When pots are made during summer, the natural temperature is sufficient. In winter they are kept in a temperature of from fifty to fifty-five degrees Fahrenheit. They remain in the room where they are made for a period varying from nine to twelve months. Being afterwards removed to another apartment, where the heat is from eighty to ninety degrees Fahrenheit, they are kept there for about four weeks. They are then removed for four or five days, more or less, according to their previous state of dryness, to the annealing arch (of which figs. 1 and 2, Plate CCLXVII. is an elevation and ground plan), which is gradually and cautiously heated up till it reaches the temperature of the working furnace, whither, after being sufficiently annealed, they are carried as quickly as possible. Pots last upon an average from eight to ten weeks. Their value is usually estimated

Crown-Glass.

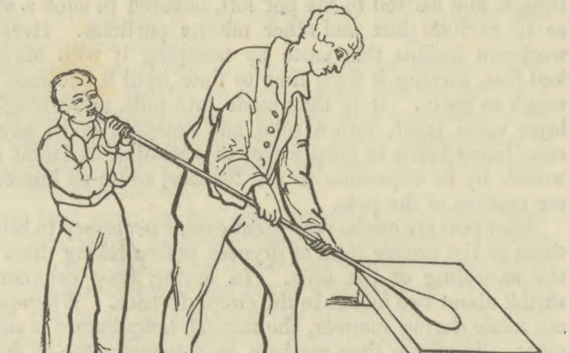
at L.8 or L.10 each. A section of a crown-glass pot, showing their usual dimensions, is given at Plate CCLXVIII. fig. 2.

To the frit thrown into these pots there is added a proportion, about an eighth, of cullet or broken crown-glass. After this has been done, the furnace is raised to the highest possible degree of heat. The pots are filled every third hour or so, according as the frit melts, till they are completely full. The intensity of the heat is then increased, if possible, till the metal, as it is now called, is reduced to fine liquid glass, which is then ready for the operations of the workman.[1] From twenty-four to thirty hours in all are required for this process, which is called founding.[2]

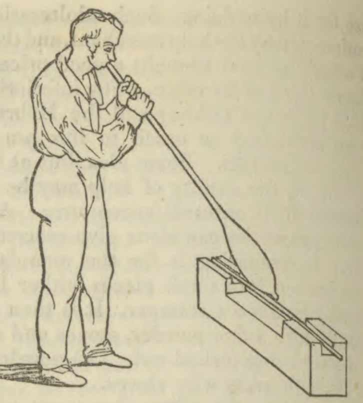
The furnace is slackened for about two hours, and the metal being now in a workable state, the first operator who approaches the furnace in which the pot of liquid glass is placed is the *skimmer*, who skims off all crude or extraneous substances from the surface of the metal. Next follows the *gatherer*, who is provided with an iron pipe or tube, six or seven feet in length, and of this shape.

Having previously heated that end of the tube which takes up the glass, he dips it into the pot of metal; and by turning it gently round, gathers about one and a half pound of liquid glass on the end of it. Having allowed this to cool for a little, he again dips it into the pot, and gathers an additional quantity, of from two and a half to three pounds. This is also permitted to cool as before, when the operation of dipping is again repeated, and a sufficient quantity of metal, from nine to ten pounds weight, is gathered, to form what is technically called a table or sheet of glass. The rod, thus loaded, is held for a few seconds in a perpendicular position, that the metal may distribute itself equally on all sides, and that it may, by its own weight, be lengthened out beyond the rod. The operator then moulds the metal into a regular form, by rolling it on a smooth iron plate, called the "marver," a term corrupted from the French word *marbre*.

He then blows strongly through the tube, when his breath penetrating the red-hot mass of glass, causes it to swell out into a hollow pear-shaped vessel, thus:

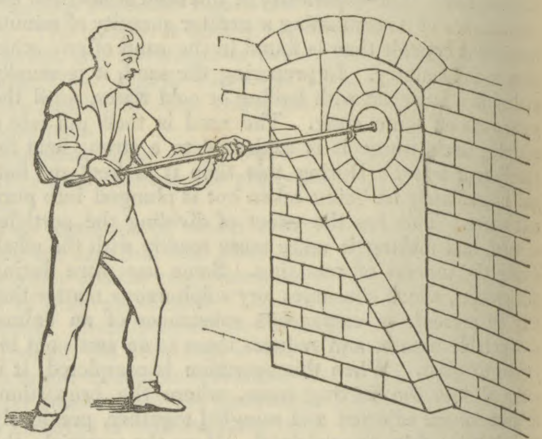


The tube with the elongated sphere of glass at the end of it is then handed to the *blower*, who heats it a second and third time at the furnace, pressing the end, between each blowing, against the bullion bar, so called from the part thus pressed forming the centre of the sheet or bull's eye, thus:

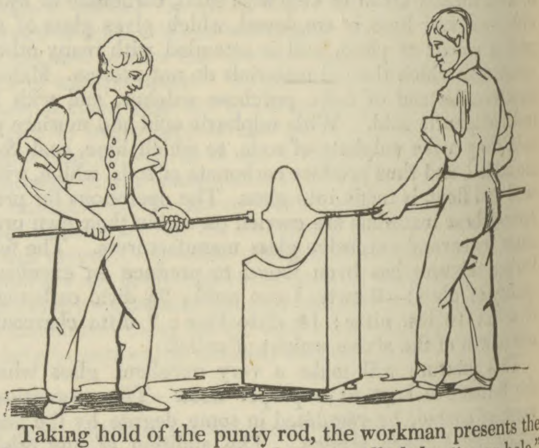


By the dexterous management of this operation, the glass is brought into a somewhat spherical form.

The blower heats a third time at the bottoming hole, and blows the metal into a full-sized globe thus:



When this part of the process has been completed, and the glass has been allowed to cool a little, it is rested on the casher box, and an iron rod, called a "*pontil*" or punty rod, on which a little hot metal has been previously gathered, is applied to the flattened side, exactly opposite the tube, which is detached by touching it with a piece of iron, dipped beforehand in cold water, leaving a circular hole in the glass of about two inches diameter. The operation of attaching the punty is shown by the following plate.

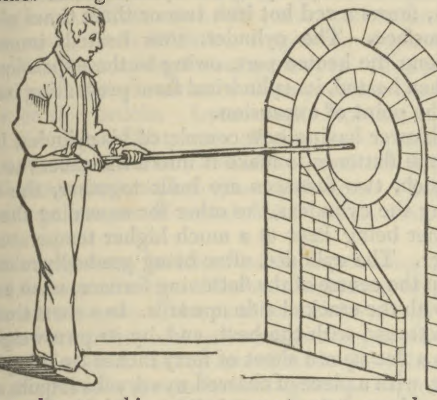


Taking hold of the punty rod, the workman presents the glass to another part of the furnace called the "nose hole," where the aperture made by its separation from the tube is now presented and kept until it has become sufficiently ductile to fit it for the operation of the flashing furnace. Whilst here, it is turned dexterously round, slowly at first, and afterwards with increasing rapidity; and the glass yielding to the centrifugal force, the aperture just mentioned becomes enlarged.

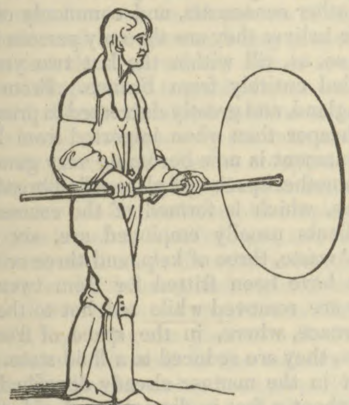
---

[1] The *sandiver* or glass gall is removed while the furnace is at its extreme degree of heat.

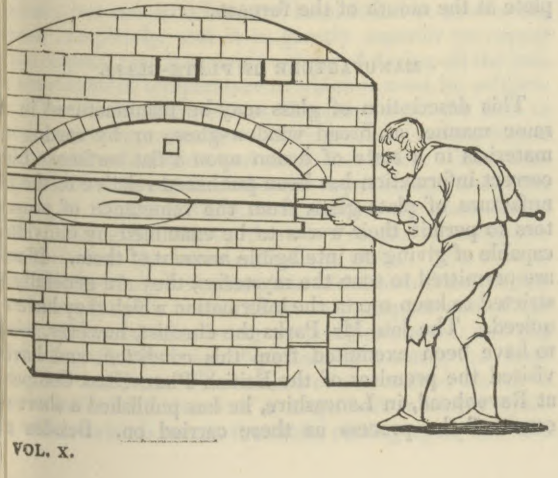
[2] A piece of wood about eleven inches long by seven broad, with a hole three inches by one inch, forms an excellent protection to the eyes from the heat to which they are exposed when examining the metal in the pots.



The workman, taking great care to preserve, by a regular motion, the circular figure of the glass, proceeds to whirl it round with increasing velocity, until the aperture suddenly flies open with a loud ruffling noise, which has been aptly compared to the unfurling of a flag in a strong breeze; and the glass becomes a circular plane or sheet, of from four to four and a half feet diameter, of equal thickness throughout, except at the point called the bullion or bull's eye, where it is attached to the iron rod. The following figure will give some idea of this very beautiful part of the process.



The sheet of glass, now fully expanded, is moved round with a moderate velocity until it is sufficiently cool to retain its form. It is carried to the mouth of the kiln or annealing arch, where it is rested on a bed of sand, and detached from the punty rod by a shears. The sheet or table is then lifted on a wide pronged fork, called a faucet, and put into the arch to be tempered, where it is ranged with many others set up edgewise, and supported by iron frames to prevent their bending. From four to six hundred tables are placed in one kiln.



A sketch of the interior of a crown-glass house, during the progress of these operations, has been given in Plate CCLXVIII. fig. 1.

The kiln having been clayed up, the fire is permitted to die out, and the heat diminished as gradually as possible. When the glass is properly annealed, and sufficiently cold to admit of its being handled, it is withdrawn from the oven, after the removal of the wall built into the front of the arch, and is then quite ready for the glazier's use. It is first, however, removed to the manufacturer's warehouse, where the circular sheets are cut into halves, and assorted into the different qualities, known to the tradesmen by the names of seconds, thirds, and fourths.

We conclude our remarks on the manufacture by observing, that the quality of glass does not depend upon the mixtures alone, but also upon the treatment it receives after it has been made, the quality of the coals, and management of the furnaces. Cleanliness in every department of the manufacture, a general knowledge of chemistry, and of the art in all its details, with the most unremitting industry, and skill in the direction and government of the operatives, are all essentially necessary for the production of good glass.

British Sheet.

MANUFACTURE OF BRITISH SHEET-GLASS.

This article is only manufactured by Messrs Chances and Hartleys, of West Bromwich, near Birmingham, who, after having visited the glass manufactories of France, Belgium, and Germany, commenced, in 1832, the making of British sheet. The principle upon which it is manufactured is the same as that acted upon in the making of common or green glass. The metal is formed into cylinders, and then flattened into sheets. The French, Belgians, and Germans, having pursued this system for the last fifty years in making their window-glass, have much improved the old mode of making it; and as the parties who are now manufacturing this article in England are crown-glass makers, and have imported all the improvements adopted in the making of sheet-glass in France, Belgium, and Germany, and combined with these the improvements which their experience as crown-glass makers had taught them during the same period, they have surpassed the French, Belgians, and Germans in sheet-glass, and can now compete with them in all parts of the world.

There is no crown-glass made in France; and their window-glass, though superior to our broad or common glass, is not equal to the British sheet. In Germany there is little crown-glass made, and that of a very inferior quality. The greater part of the glass made in that country is sheet, and it is of much better quality than the French or Belgian. In Germany a common sort of glass is made, in the following manner: Three or four workmen form a partnership, and, having fixed upon a place in the woods where clay and sand are easily met with, they proceed to build a glass-house with wood and clay. They then make the pots, and, from the ashes of the wood which they burn, obtain potash, which, after it has been mixed with sand, they melt into glass. They blow the metal into cylinders, flatten it into sheets, cut, pack, in short, perform the whole operations from first to last, themselves. A good deal of the best of the glass made in this manner is sent to Nuremburg, where it is polished and sent into Holland. Some of it is sometimes smuggled into this country, and is known by the designation of Dutch glass.

British Sheet.

The expense of making British sheet is about the same as making crown-glass, excepting in the case of large squares, when it is much less; in crown-glass it is very difficult to get a square 34 × 22, but in sheet-glass the common size is 40 × 30; nay, sheets are sometimes made as large as 50 × 36. Its other advantage over crown is, that it has none of that wavy or curved appearance, by which the vision is so much distorted in crown-glass; but, at the same time, sheet-glass has rather an unpleasant appearance when viewed from the outside of a building, in consequence of an unevenness of surface, technically termed *cockled;* when viewed, however, from the inside, it is difficult to distinguish it from plate-glass.

The materials employed in the making of sheet-glass are the same as those used in the making of crown-glass. The large melting furnace is also very similar; in France and Belgium they usually contain six or eight pots, but at the manufactory at West Bromwich the furnace contains ten pots, each containing seven cwts. of metal, which requires fourteen hours to melt.

In a line with each pot, and four feet from the ground, are erected ten stages, with an open space between each, of about two feet, through which the workman swings his glass when making cylinders. When the metal is ready for working, the ten workmen take their stations, each having his own pot and stage, and also an assistant, and commence making the cylinders, as follows: After gathering the quantity of metal required (which varies from three to twenty pounds), the workman places it in a horizontal position upon a wooden block, which has been hollowed, so that, when the workman turns the metal, it shall form it into a solid cylindrical mass. In the mean time, the assistant, with a sponge in his hand, and a bucket of water by his side, lets a fine stream of water run into the block, which keeps the wood from burning, and also gives a brilliancy to the surface of the glass. The water, the moment it comes in contact with the glass, is raised to the boiling point, and, in that state, does no injury to the metal; but it is only when the metal is at a high temperature that such is the case; for, whenever the glass is cooled to a certain degree, it immediately cracks upon coming in contact with water. When the workman perceives that the mass of metal is sufficiently formed and cooled, he raises the pipe to his mouth at an angle of about seventy-five degrees, and commences blowing it, at the same time continuing to turn it in the wood block, till he perceives the diameter to be of the requisite dimensions, which are usually about ten inches. He then reheats this cylindrical mass, and, when it is sufficiently softened, commences swinging it over his head, continuing to reheat and swing till he has made it the desired length, which is commonly about forty inches. It is now in a cylindrical form, forty inches long and ten inches in diameter, one end being closed, and the other having the pipe attached to it. The workman now begins to open the end which is closed, for which purpose he encloses the air in the cylinder, by stopping the aperture of the pipe with his finger; and then placing the closed end of the cylinder towards the fire, it becomes softened, while at the same time the air within is expanding, and, in about thirty seconds, the glass becomes too soft to retain it, and bursts, a small aperture being formed at the point of the cylinder. The workman then turns the cylinder round very quickly, and, by keeping it warm at the same time, flashes it out perfectly straight; the other end, which is attached to the pipe, has now to be cut off. This is done in the following manner: The workman having gathered a small quantity of metal on the pontil, draws it out into a thread of about one eighth of an inch in diameter, laps it round the pipe end of the cylinder, and, after letting it remain there for about five seconds, withdraws it suddenly, and immediately applies a cold iron to the heated part, which occasions such a sudden contraction, that it cracks off where the hot string of glass has been placed round it. The workman having now formed a perfect cylinder of forty inches in length and ten in diameter, has, before it can be flattened, to split it on one side, so that it can be opened out; but before doing this, he is obliged to let it cool, and then, laying the cylinder horizontally upon a bench, draws a red hot iron two or three times along the inner surface. The cylinder, thus heated, immediately splits along the heated part, owing to the expansion of the glass when heated, its cylindrical form preventing its breaking at the point of expansion.

The blower having now completed his cylinder, hands it over to the flattener to make it into a flat sheet; to accomplish which, two furnaces are built together, the one for flattening the cylinders, the other for annealing the sheets, the former being kept at a much higher temperature than the latter. The cylinder, after being gradually reheated, is placed in the centre of the flattening furnace, upon a smooth stone, with the cracked side upwards. In a short time it becomes softened with the heat, and by its own weight falls out into a flat square sheet of forty inches by thirty. The flattener, with a piece of charred wood, rubs it quite smooth, and then places it in the annealing arch, where it remains about three days to be annealed. A workman will make sixty cylinders 40 × 50 in one day; and a flattener can flatten the same number in the same time. This glass can be made of any thickness from one twentieth to half an inch; but, in consequence of the heavy duty in this country, it is seldom made more than one twelfth of an inch in thickness, crown-glass being about one sixteenth.

The same enterprising company also manufacture large oval and square British shades, used for covering French clocks and other ornaments, and commonly called French shades. We believe they are the only persons in this country who do so, as, till within the last two years, we have been supplied entirely from France. From their being made in England, and greatly decreased in price (being fifty per cent. cheaper than when imported from France), this beautiful ornament is now becoming very generally used.

There is another species of glass called broad or common window-glass, which is formed of the coarsest materials. The ingredients usually employed are, six measures of soap-boilers' waste, three of kelp, and three or four of sand. After these have been fritted for from twenty to thirty hours, they are removed while red hot to the pots in the working furnace, where, in the space of from twelve to fifteen hours, they are reduced to a fluid state. The metal is taken out in the manner already described, and blown into globes about a foot in diameter. A piece of iron dipped in cold water is run along them, and produces a crack nearly rectilinear; and, while yet warm and ductile, these spheres are opened out and flattened on a smooth iron plate at the mouth of the furnace.

MANUFACTURE OF PLATE-GLASS.

This description of glass may be manufactured in the same manner as broad window-glass, or by casting the materials in a state of fusion upon a flat surface. Little correct information has been published relative to the manufacture of plate-glass, from the reluctance of proprietors to permit their works to be examined by individuals capable of giving an intelligible account of them. If such are permitted to scan the mysteries, they are generally restricted to keep secret the information which they have acquired. The late Mr Parks the chemist, however, seems to have been exempted from this condition, and having visited the premises of the British Plate-Glass Company, at Ravenhead, in Lancashire, he has published a short account of the process as there carried on. Besides the

Plate-Glass.

above manufactory, there are other two in Great Britain; Messrs Cookson and Co.'s, South Shields, and W. A. A. West's, Eccleston, near St Helen's; and plate-glass is also made at the celebrated works at St Gobain in France, besides other places upon the Continent.

The following is Loysel's account of the relative proportions of the materials used at St Gobain, in the manufacture of plate-glass. White sand, 100 parts; carbonate of lime, 12 ditto; soda, 45 to 48 ditto; fragments of glass of like quality, 100 ditto; oxide of manganese, $\frac{1}{4}$. The following proportions of ingredients are said to produce the best description of this article. Lynn sand which has been well washed and dried, 720 parts; alkaline salt containing 40 per cent. of soda, 450 ditto; lime slaked and sifted, 80 ditto; nitre, 25 ditto; broken plate-glass, 425 ditto. These quantities produce one pot of metal which yields 1200 pounds of glass.

Great nicety must be observed in conducting the processes of this manufacture. The materials must be selected with the utmost care. The sand should be of the whitest and finest description, and well washed and passed through a sieve, previously to being mixed with the other ingredients. Soda is always preferred to potash, because it imparts a higher degree of fluidity to the glass, and also because the impurities which it contains are more easily dissipated by the heat. Lime acts as a flux, and manganese has the effect of giving a slightly reddish hue to the mixture by which the colours of the other materials are neutralized, so that scarcely any appreciable tint remains. Cobalt is likewise used in some manufactories, much for the same purpose as manganese. The broken glass, or *cullet* as it is technically called, is those fragmentary portions which are cut from the plates when they are squared, or that which may flow over in the process of casting. The sand, lime, soda, and manganese, being properly mingled in the proportions above given, are fritted in small furnaces, where the temperature is gradually raised to a red or white heat, and there maintained until no more vapour is evolved, nor change undergone by the mixture. This process occupies six hours, and after its completion the other ingredients are added, consisting of cullet and cobalt. At St Gobain there are two kinds of crucibles employed; the one in which the glass is melted is called a *pot*, and has the shape of an inverted truncated cone; the other is entitled a *cuvette*; it is kept empty in the furnace, and exposed to the full degree of heat. Forty hours are requisite to vitrify the materials properly, and bring the glass to a fit state for casting. The pots are skimmed in the manner already described. When the liquid mass has been properly refined, the cuvette is filled by a copper ladle, and after sufficient time is allowed for the bubbles created by this disturbance to escape, it is removed to the table where the plates are cast. Copper was the metal of which tables were formerly constructed; but cast iron has now been found to answer the purpose completely, and it is greatly superior to copper in this respect, that it remains uninjured during all the sudden transitions of temperature to which it must be subjected. The British Plate-Glass Company were the first to introduce this improvement. They procured a plate fifteen feet long, nine feet wide, and six inches thick. The sides are provided with metallic ribs, the depth being exactly the measure of thickness which it is desired the glass should be of. During the casting there is a similar rib temporarily attached to the lower end of the table. The cuvette being filled with melted glass, it is withdrawn from the furnace by means of a crane, taken to the upper end of the casting table, and after being properly scummed, and elevated to a sufficient height by means of a crane, it is emptied of its contents. The surface of the melted matter is then smoothed by means of a large hollow copper cylinder, which extends across the table, resting upon the side ribs. This is set in motion, and rolled over the glass, by which process it is spread out into a sheet of uniform breadth and thickness. When the plate has become completely hardened, it is carefully inspected, to see that no flaws or bubbles appear on the surface. Should any be found, the sheet is immediately divided by cutting through them. It is afterwards removed to the annealing oven, where it is placed in a horizontal position, and remains for about fifteen days. When glass is in a high state of fluidity it is liable to be injured even by a draught of air, so that the apartment must be kept as free as possible from disturbance. The opening or shutting of a door, by setting the air in motion, might impair the value of the plate. After having been withdrawn from the annealing oven, they have to undergo the operations of squaring, grinding, polishing, and silvering, before they are fit for the market. These processes have thus been described by a late writer upon the subject.

"The first process—that of squaring and smoothing the edges—is performed by passing a rough diamond along the surface of the glass, guided by a square rule; the diamond cuts to a certain depth into the substance, when, by gently striking the glass with a small hammer underneath the part which is cut, the piece comes away; and the roughnesses of the edge then left are removed by pincers. The plate is then taken to the grinding apartment.

"The next step is to imbed each of the plates upon a table or frame adjusted horizontally, and made of either freestone or wood, cementing the glass securely thereto by plaster of Paris. One plate being then reversed and suspended over another, the material employed in grinding their surfaces is introduced between the two, and they are made to rub steadily and evenly upon each other by means of machinery set in motion by a steam-engine." River sand and water were formerly used for the purpose of abrading the surface, but ground flint is now substituted, as answering the purpose better. When one side of each plate has been sufficiently ground, it is loosened from the frame, and turned over, so as to present the other surface to be ground in the same manner. Some degree of pressure is employed, by loading the upper plate with weights, as the grinding of each side approaches to completion. The process thus described used formerly to last during three entire days, but this time is now much abridged. The greatest attention is required in order to finish with the surfaces perfectly level and parallel, for which end a rule and plumb-line are employed.

By means of this grinding, the plates will have been made level; but they are too rough to receive a polish. To fit them for this, they must again be ground with emery powder of increasing degrees of fineness. The preparation and sorting of this powder are effected in the following simple and ingenious manner:—"A considerable quantity of emery is put into a vessel containing water, and is stirred about violently until the whole is mechanically mixed with the water. Emery is absolutely insoluble by such means; and if the mixture were left at rest during a sufficient time, the whole would subside in layers; the coarsest and heaviest particles sinking first, and so on successively, until the very finest particles would range themselves as the upper stratum. Previously to this, however, and while these finest grains are still suspended in the water, it is poured off into a separate vessel, and the emery is there allowed to settle. A fresh supply of water is poured into the first vessel, the contents of which are again violently agitated, and allowed partially to subside as before. A shorter interval is allowed for this than in the first case; and then the liquor is poured off into a third vessel, by which means emery of the second degree of fineness is separated. This operation is repeated in order to obtain powders having four different degrees of fineness. The deposits are then separately dried upon a stove to a consistence proper

Stained Glass.

for making them up into small balls, in which form they are delivered to the workmen.

"In this further rubbing together, or, as it is called, *smoothing* of the glass plates, it must be understood that the coarsest emery is first used, and so on, substituting powders having increasing degrees of fineness as the work proceeds."[1]

These processes finished, the glass, although perfectly even, appears opaque or deadened on the surface, and requires polishing. This is effected in the following manner. A piece of wood is covered with numerous folds of woollen cloth, the layers being divided by some carded wool interposed between each, the whole forming a tolerably hard but elastic cushion, which is furnished with a handle. The plate is laid upon a bed of plaster, as already described, and the cushion being wetted, is covered with the red oxide of iron (the *colcothar* of commerce), and moved backwards and forwards upon the surface of the plate. Lastly, if the glass be intended for mirrors, it is silvered, that is, covered on one side with a thin coating of mercury.

The process of *blowing* plate-glass differs so slightly from the methods used in producing broad glass that they need not be here repeated. Any difference that does exist, arises from the great bulk and weight of the mass of glass operated upon.

STAINED AND PAINTED GLASS.

The invention of the art of colouring glass, that is, imbuing it throughout with any particular tint, seems, as we have already had occasion to remark, to be nearly coeval with the discovery of the art of making the substance itself, Egyptian ornaments, and druidical beads, of the highest antiquity, as already mentioned in our historical notices, having been found of numerous and surprisingly beautiful colours. The art of staining and painting glass so as to form pictorial representations of objects, is, however, of comparatively recent date. The precise period of its introduction is unknown, but it is at least certain that it has existed for many centuries in different degrees of excellence, and that it has moreover been gradually advancing in improvement. The earliest record which we possess concerning the existence of this beautiful art is of the age of Pope Leo III., that is, about the year 800, a period which witnessed the erection of many of the most magnificent ecclesiastical edifices upon the Continent. Several centuries, however, elapsed before stained glass came into general use. The earliest specimens with which we are acquainted differ from those of more recent date, inasmuch as they are composed of small pieces of glass imbued throughout with colour during the process of manufacture, and to which artists give the name of pot metal.

These were united by joinings of lead after having been cut to the required shapes, and are thus made to form a species of Mosaic work; but, as might be expected, they do not possess that breadth of colour, or truth and delicacy of effect, which the improvements of more modern artists have enabled them to communicate to their works. The manufacture of stained glass was for many centuries confined to the Continent, and was nowhere prosecuted with so much success as at Venice. At the same period that the pointed style of architecture reached the meridian of its splendour in England, we find native artists who were fully qualified to do justice to the grandeur of the buildings they were called on to adorn, and not unworthy of being put in competition with their most successful foreign rivals. In proof of this we need only refer to the windows of York Minster, of the collegiate chapels and halls of Oxford, and those of the chapel of King's College, Cambridge. A pretty general, but very erroneous, idea exists with regard to the superiority of the colours employed in ancient glass painting over those in use at the present day. It is believed by many, and taken for granted by others, that not only is the same brilliancy unattainable by modern skill, but that the art of producing the colours themselves is itself entirely lost. This is a very mistaken notion; for not only are those now employed as brilliant and durable as the colours of the ancients, but others have been added, which they most probably did not know how to produce, or at least did not use. Amongst these are pink, straw colour, and other compound tints. That indiscriminating veneration for the antique, which has so often and so seriously interfered with the claims of modern art to the encouragement to which it is entitled, has operated against glass painting and staining with perhaps fully more force than against any other art. It has induced a belief that excellence in the art is confined to the ancients; and that all the productions of the modern glass stainer and painter are mere flimsy imitations of those of the artists of the fourteenth and fifteenth centuries. Nothing farther is necessary to convince any one of the injustice and absurdity of this notion, than a visit to the warehouse or workshop of any respectable glass painter and stainer of the present day.

The following observations are deserving of the attention both of artists and others less immediately interested in the subject. "Captivated with the vivid hues of the antique, persons have remarked, with more frequency than judgment, 'such colours certainly cannot be equalled in the present day.' With the exception, perhaps, of its reference to the ancient ruby, which appears to have been lost for the past two centuries, this assertion may be altogether denied; and more than this, besides commanding all the resources of the old artists, ours of the present day are in possession of many practical advantages which the former had not, among which is that of their being able to lay every variety of colour on one and the same piece of glass, and thus often to execute with nicety in ten pieces a subject on which a hundred formerly would not have been so well bestowed. With these opportunities, and with greatly improved ideas upon the science of painting in general, our artists should be qualified for productions of a higher order than those of their ancient predecessors; and it remains, then, to be asked, on what account they fail to imitate their works with success. The chief occasion of this may be found in the imperfect acquaintance which the modern artists have with the principles of old English design, both pictorial and architectural. They seem to forget that these principles are totally distinct from those observed in the paintings of the later Italian masters, whose figures and groups are not unfrequently copied for the embellishment of our windows in the pointed style, but always without success. Strict simplicity, solemn dignity, and appropriate costume, are primary points for consideration in imitating the figures of our old windows. In the imitation also of those architectural decorations with which such figures were anciently surrounded, it is worse than puerile to suppose that mouldings and foliage borrowed from the Greek and Italian systems can by any possibility be so arranged as to bear a resemblance to the characteristic features of the old English style, a style as isolated as it is magnificent. Errors such as these can only be avoided by means of patient and attentive study, both of actual remains and of the numerous explanatory works now rendered generally accessible by the invaluable labour of able antiquaries and

---

Stained Glass.

d ughtsmen. But after an adequate acquaintance with th principles of design is attained, those of execution are n less to be observed; all the subjects of the painting, an especially those of an architectural character, being re eved more by strong black outline and variety of colo r than by the use of decided shadows. Modern imita ons are frequently injured by displaying too much of m dern art; the work, by being too highly finished, and th t in few pieces, often loses the glittering effect that atte ds its more simple prototype. An additional precauti n to be observed consists in the avoidance of excessive d pth of colour; a consideration, the neglect of which has g en to some modern imitations a vulgar, gaudy appeara e, totally dissimilar to the equalised and subdued, yet li ly colouring, observed in the best specimens of the m dle ages."

The want of harmony here complained of is too often a l offensively manifest in modern public buildings, w ich have been fitted up with stained-glass windows, and w ere the absurd incongruities of style have marred rath r than increased the elegance of the structure. Flor and meaningless mouldings, scrolls and foliage, are seen d turbing the simple beauty of Grecian architecture, or t austere and majestic grandeur of a Gothic pile; so that p ple seem to have been careless as to the character or p priety of the ornament, provided they did but procure s mething in the shape of stained glass. No doubt much o this evil is to be attributed to the unskilfulness of the a ists employed, few of whom are possessed of a suffic nt knowledge of design, or the more intricate principles o the pictorial art, to enable them to suit their embellishm nts to edifices of a noble or commanding character. sadvantages inherent in the art itself tend to debar f m engaging in it men whose talents as painters ensure t m patronage and success by adhering to the palette and t canvass. The expense of materials; the tedious and p carious nature of the process, where the artist cannot w tch with satisfaction the effect which each additional s oke of his brush gives to the work as it grows beneath h hand, but must await in suspense the result of its exp sure in the kiln; the difficulty of introducing such works o art to general notice; and the uncertainty of ultimate r muneration for his labours; prevent the man of genius f m prosecuting an art, which nevertheless presents the m st favourable opportunities for the expression of his i as. There are not wanting, however, specimens of tinguished excellence produced by modern skill in t higher branches of this art, especially in the historic department. They certainly do not possess that mell w richness of colour, that calm and imposing grandeur character, which distinguishes many of the older pro ctions, but they excel them in accuracy of drawing, d in details; and while we know that it is perfectly pos le to combine the various excellencies of former artists th those of a more recent date, we do not despair of eing greater triumphs achieved in the art of staining g ss than have yet been effected. Every variety of subj t may be executed in this style. To the landscape inter it offers peculiar advantages, from the power contrasts in light and shade which it enables him to oduce; while to the painter of flowers it affords a ans wholly unequalled for displaying the delicacy and the same time splendour of colour, which his proto pes in nature place before his eyes.

It is somewhat strange, that while almost every other t has been called on to contribute in some way or other our domestic comforts, or to the adornment of our ellings, that of glass painting and staining, though its oductions are not more expensive than many of these, d are certainly not inferior in elegance, should yet be t rarely applied to domestic purposes, where it could be employed with admirable effect. When stained glass has been used in the embellishment of the mansions of the middling, or even of the upper classes, it has been hitherto in a great measure confined to hall and staircase windows, and to windows placed in similar situations; but its use might be much extended, with great advantage in point of ornamental beauty.

If, for instance, the windows of a room were filled with stained glass, whose prevailing tints should harmonize with the predominating colour in the apartment, a striking and singularly pleasing effect would be produced. Where the expense, or any other objection, might be urged against figured glass, in which masses of brilliant colour are employed, that description which is plain and of one tint, such as brown, ruby, pale yellow, or similar hues, might be substituted; and if selected with reference to the prevailing colour of the interior with the view of either heightening or deepening its complexion, a warmth and richness of tint would be thrown around the apartment, such as no other contrivance of art can communicate. And where both of these descriptions of coloured glass might be found unsuitable, either from the expense or the too great exclusion of light, there is a third description of ornamental glass which might be employed, and which is not subject to these objections. This is a pale tracery, resembling lacework, which, when properly executed, is exceedingly beautiful, and is marked by an appearance of singular lightness and elegance. The introduction of such windows as might thus be produced would greatly enhance the beauty of our domestic architecture.

Except in the name, painting on glass has no resemblance to any other department of the pictorial art but that of porcelain. Both the colours, and the process of their application throughout, are entirely different. While animal and vegetable substances are freely used as colouring matter in every other department of the pictorial art, they are wholly excluded in that of glass painting, where all the pigments used are subjected, after being laid on, to the operation of fire, to make them penetrate the body of the glass, or become fused on its surface—a process which would wholly destroy the colouring properties of such substances. All the colours employed in glass painting and staining are oxides of metals or minerals, as gold, silver, cobalt, which not only stand the fire, but require the powerful interference of that agent to bring out their brilliancy and transparency. Some colours, on the application of heat, penetrate the body of the glass, and, from this circumstance, are called stains; while others, being mixed with a vitreous substance called flux, become fused or vitrified on the surface. The former produces a variety of colours, and all of them are perfectly transparent. The produce of the latter are only semitransparent, but they may be made to yield any colour or tint required.

In preparing these colours, the most important point to be attended to is, to have all those that are to be used at the same time of an equal degree of softness. To attain this, those that are hard, and require a great degree of heat to make them effective, must be fixed first; leaving the soft colours, for which a slight heat only is necessary, to the last. If used promiscuously, and without regard to this precaution, some of the colours would be rendered too fluid, while others would be insufficiently fused, and the work in consequence spoiled. It is likewise of great importance to make a proper selection of glass for the purposes of staining and painting, as one kind will assimilate more freely with one colour than with another. The description of glass generally chosen for painting or staining is the best crown-glass.

It does not seem necessary to enter at length here into the details of the process of glass painting and staining, as our account of the processes and mixtures must of ne-

Crown-Glass Cutting.

cessity be almost entirely a recapitulation of what has been more fully and satisfactorily stated in other works, than the space allotted to this part of the subject would permit us to do; while all such details would be nearly useless for any practical purpose, there being scarcely a possibility of either communicating or acquiring such a knowledge of the art of glass painting or staining as would enable any person to understand or practise it successfully, unaided by personal observation and extensive experience.

CROWN-GLASS CUTTING.

This is a subject of very great importance to the glazier. Since the sheets of glass are circular, and the panes of glass most commonly used of a square or oblong shape, it is evident that there must some waste result from cutting up a sheet. The grand object of the glass-cutter, therefore, in the first place, is not only to cut up the sheet into panes which shall produce the least waste, but also, since the sheets of glass vary in size, to know what panes can be obtained from a sheet of a given diameter. To the glass-cutter this is well known, and to the general reader it can scarcely be explained so as to be completely understood. The utensils necessary for this purpose are a cross cutting board and a breaking out board, both of which are graduated or indented with brass lines in such a manner as to show through the sheet of glass, when laid on the cutting table, how many panes of one size, and how many of another, may be obtained from a sheet of given dimensions: squares and laths, on which feet, inches, and fractional parts are marked, are also necessary.

Crown-glass always cuts best in a warm temperature. When it happens to be hard, which is seldom the case (a bad diamond, or not knowing how to use a good one, being the usual cause of breakage), it has been found to cut better after warming the glass before the fire, which has the effect of diminishing the tension of the ill-annealed glass.[1]

GLAZING OF WINDOWS.

Before proceeding to speak of glazing, the order in which its various processes present themselves naturally demands that we should say something of putty.

This important and indispensable article in the glazier's trade is composed of whiting and linseed oil. Chalk is sometimes used instead of the former, but the expense and labour incurred in preparing it is much greater, and besides it is generally mixed with sand, so that it is no object to the glazier to employ it. Whiting is in every way to be preferred; it must be thoroughly dried before the oil is added to it, otherwise the union will not be effected, or at least it will be very imperfect.

After the whiting has been thoroughly dried and prepared, it ought to be passed through a very fine sieve, and all the lumps and knots that remain pulverised, and then also passed through the sieve. Great care must be taken to keep the whiting free of sand and other extraneous substances.

When putty is to be made, put the proper quantity of oil into a tub or other open vessel, and gradually add the whiting whilst yet in a hot state, at the same time keeping the whole in motion with a stick, until it becomes of a sufficient consistency to admit of being wrought by the hand on a board or table. Having been removed thither from the tub, it must be wrought up with dry whiting, until it is converted into a solid compact mass. When brought to this state, it ought to be put into a hollowed stone or mortar, and beat with a wooden mallet till it becomes soft and tenacious, when more whiting must be added, until it has attained a proper consistency.

Glazing.

It is considered that the putty is improved if the whiting and oil, after being mixed, are allowed to remain for about twenty hours before being wrought up. After putty has been made, it should be firmly packed in a cask, from which it may be taken from time to time, as it is required. It ought not to be used for ten or twelve days after it is made, when its colour, from having at first been a dull yellow, will have changed to a whitish free-stone, which renders it more suitable for most purposes. After a lapse of six or eight weeks, the putty in the cask will become hard; but it is easily restored to its original softness, by being beat as before, and it is much improved by this second operation.

Putty is made in England in large quantities, and is ground in a mill in the same way as white lead; but this is no improvement, as it is generally overwrought in this method of preparation, and rendered so tough and tenacious that it does not work well, and is entirely without that degree of pliability which putty ought to possess.

When putty is required of a superior degree of fineness, and which will also dry quickly, add a little sugar of lead, or litharge; and if an increase of strength be wanted, a little white lead.

We now proceed to glazing.

To glaze well, neatly, and expeditiously, simple as the operation may appear, is an art for the thorough acquirement of which many years of practice are necessary.

When a glazier receives an order to glaze a house, he must first, of course, proceed to measure the work to be done. In doing this, he must take the *full* size of the panes, that enough may be left for stripping, so as to produce an accurate fit into the sashes. This fitting must be performed with great care and nicety, leaving about one thirty-second part of an inch of space on each side and end of the pane, between it and the check. In other words, the pane must fill the space appropriated for it, to within the thirty-second part of an inch, or thereabouts.

This space is left to provide for such occurrences as the wood swelling with moisture, or the building setting, in which cases the panes would be apt to crack.

When the panes have been fitted into the checks of the sashes in the manner spoken of, they must be removed, and the checks well bedded with beat putty. This done, the panes are again returned to their places, and gently pressed or lodged into the bedding, the workman, as it were, humouring the glass should it be bent or twisted, and taking care that there is no hard extraneous substance mingled with the putty, which might endanger, if not actually break, the glass. When a pane is perfectly bedded it lies quite firm, and does not spring from the putty; but when, either from a perverse bend or twist in the glass, or any other accidental cause, it happens that it cannot be made to go quite close to the check, the vacant space must be carefully and neatly filled upon the back puttying, otherwise the window will not be impervious to the weather, and will be very apt to fall into decay by the admission of moisture.

It may not be superfluous to observe here, that the convex or round side of the pane, where such a shape occurs, should be presented to the outside, and the concave or hollow to the inside. The reasons for recommending this disposition of such panes are so obvious that they need hardly be enumerated. It may, however, be stated generally, that when thus placed, they resist the weather better than if the hollow sides were exposed to it.

After the pane has been bedded, the next process is the outside puttying. This putty should be kept in the fore check, about the thirty-second part of an inch below the level of the inside check, so as to allow the thin layer of paint which binds these two substances together to join the putty and glass; and that it may not offend the eye by being seen from the inside; and that, when it is painted, the brush may not encroach on any visible part of the pane, leaving those ragged lines or marks which are so often seen from the inside on ill-finished windows, and which are so displeasing to the eye. This operation, and finishing the corners, are two nice points in the art, and therefore, when properly done, discover the neat-handed and skilful tradesman.

---

[1] To glaziers and others who may wish to obtain a thorough acquaintance with the subject, we would recommend a small volume lately published, entitled *Crown-Glass Cutter and Glazier's Manual*, by William Cooper, Edinburgh, Glass-cutter and Stained-Glass Maker, &c. in Ordinary to the King for Scotland.

It is the opinion of some experienced glaziers, that the inside puttying, which is the next process, ought to be allowed to remain eight days before being finished off, while others, again, say that this should be immediately done. The experience of the writer inclines him to the former opinion. By standing over for some little time, the putty acquires a hardness which admits of a better and neater finish than when it is in the soft working state, and in this way also it is not liable to shrink. Of course this is only recommended in cases of extensive jobs. When only a few panes arc done, it is better to finish them off at once, than subject the employers to the inconvenience of a second visit from the glazier for so trifling a purpose.

When the finishing does take place, however, the putty must be cut clean off with the putty knife, and on a level with the style of the astragals. Complete the work by cleaning the glass and putty with a 000 duster brush, which rcmoves all dust and loose putty from the pane, *lightly* and effectually.[1]

Hot-House Glazing.—The frames or sashes of a hot-house ought, before being glazed, to receive two coats of white paint, to which a small portion of red lead has been added to facilitate its drying, and to give increased strength and durability to the paint.

The panes in the roofs of hot-houses are generally of either of three forms; the first is the square pattern; the second is the taperd, that is, terminating in an obtuse angle; and the third the semicircular. The first is most generally used; the second is considered an improvement on the first, in so far as the tapered point carries off the rain down the centre of the pane, and thereby preserves the astragals; but there is a loss in shaping the glass to the tapered point. The third or semicircular is decidedly the best pattern of the three; the water is not only drawn to the centre of the pane, and the astragals protected from the rain, but this pattern has a more elegant appearance, when uniformly glazed, than either of the two other shapes. There is no loss in cutting the glass to the curve, and it is therefore not more expensive.

The dimensions of hot-house panes are generally about six inches, and are made to overlay each other, to an extent regulated by the circumstance of their being puttied at the overlay or not.

If it is intended to fill in the overlays with putty, they need not be more than a quarter of an inch in depth; but if it is not intended to putty them, they must then be at least five eighths of an inch.

The overlays, however, ought always to be puttied, and that for two reasons. First, because it will more certainly secure their being water-tight; and because, in the next place, it will prevent the breakage to which the panes are liable from the freezing of the water, or moisture, which lodges in the overlay, and, expanding, shivers the glass in all directions; when they are filled with putty, such an accident cannot happen.

In glazing hot-house roofs, it must be observed, that the courses ought to run from end to end, and that the smaller panes, when such are used, should be reserved for the top.

When sashes are glazed, they ought to stand for eight or ten days before taking off the back putty, and they ought not to be painted for about three weeks afterwards, that the putty may consolidate. Great care, too, should be taken, when the sashes are newly glazed, that they be not in any way twisted or bent, as such an accident would almost inevitably start the panes from their beds, and thus render them pervious to water.

When sashes are of considerable dimensions, say about six feet by three, they should be strengthened by having two iron rods placed across them at equal distances, and screwed to the astragals. This will serve to prevent the accident of twisting, to which such frames are extremely liable, and which is very injurious to them after they have been filled with glass.

The putty used for glazing hot-houses ought to be of the very best description, as, from the circumstance of its position, it is necessarily more exposed to the action of the weather than in the perpendicular windows. The putty used for filling in the overlays ought to be of black or lead colour, which, as every glazier knows, is imparted to it by working it up with lamp-black; but as this substance has the effect of weakening the putty, the defect may be remedied by adding two pounds of white lead, ground in oil, to each stone of putty, and in a similar proportion to smaller or greater quantities. Indeed all putty used in glazing hot-houses ought to have a portion of white lead mixed with it, as it adds greatly to its strength.

Lattice or Lead Windows.—This antique and singularly beautiful style of glazing has unaccountably fallen much into disuse, although of late years it has certainly undergone something like a resuscitation, in consequence of a revival of the public taste for stained glass, and a growing predilection for Gothic architecture in churches, cottages, and the like. For these, and for staircase windows, and indeed all windows similarly situated, as in halls, lobbies, or the like, it is peculiarly adapted.

It may be proper to premise, that lead windows require stained or coloured glass for producing their fullest and best effects, and it was with stained glass only that they were originally constructed; but very neat and elegant windows are executed in this style with plain glass, where variety and beauty of figure are made to compensate for the absence of colour

Lead windows may be made to any pattern, and in this there is great scope for the display of a correct taste. In the time of Elizabeth, this branch of the glazier's art was carried to great excellence, especially by one Walter Geddes, who was employed in glazing most of the royal and public buildings of that period. This person executed in this style some windows of transcendent beauty, displaying an endless variety of the most elegant and elaborate figures. The most useful and most common description of plain glass lead windows, however, are those of the diamond or lozenge shape; but, as already said, they may be made to any pattern desired. The following are a few specimens of lattice windows. (See Plate

---

[1] In taking out old glass from windows, the cold putty knife is used; but when the putty has been in the windows for ten or twelve years, it becomes nearly as hard as stone, and impenetrable to the knife. In this case there are various means used to extract the glass from the frames. The application of hot iron to the putty is sometimes adopted; but this cannot with safety be applied to the bedding, to which the glass obstinately adheres. Muriatic acid diluted with water is an excellent means of removing putty from glass, its action being assisted by rubbing the putty occasionally with a bit of stick. The most effectual way to remove the glass, when the frames are worthless and the glass valuable, is to put the frames into a horse dunghill, keeping the whole damp (if the weather is not so) for several weeks, which completely loosens the glass, and rots or destroys the frames.

CCLXIX.) Fig. 1 is the east window of St Giles' Church, Edinburgh. Fig. 2 is a less imposing, but still a very chaste and beautiful, specimen of a lattice window. This has a beautiful effect by introducing stained glass into the long skittle-shaped pieces, and in the rosette in the centre. Fig. 3 represents the architecture of a window in Oxford Cathedral, filled with stained glass in the Gothic style.

The lead work can be adapted with ease to any pattern that may be chosen for the glass; and it can likewise be made to any breadth, from one eighth to five eighths of an inch. The one eighth, however, is only used for fancy work, and is not as yet much in demand; that which is most generally used is three-eighth lead. This width makes neater and better work than that of any other dimensions.

The glazier may purchase prepared leading for windows in any quantity; but he will produce it himself at half the cost, and probably more to his own satisfaction. The apparatus and tools necessary for doing this are, a glazier's vice, or lead mill, moulds for casting the lead into slender bars or rods of about eighteen inches in length, which is the first process; a three-fourth inch chisel; a hard-wood fillet for forcing the glass into the grooves in the lead frame-work; and an opener or wedge tool, made also of hard wood, or ebony, for laying open the grooves for the reception of the glass; two copper bolts for soldering, the end formed like an egg. A correct delineation of the vice or mill alluded to is given in Plate CCLXX. in describing which, in its various connected parts, the same letters of reference are adapted to the different figures, so far as necessary, which, with the isometrical views, will facilitate the comprehension of their parts and properties.

Fig. 1, an end view, partly open, of a mould for casting three varieties of patterns, which are thus prepared for being forced through the machine. By an ingenious construction of the handle, it is made to lock and unlock by inclined planes, acting on studs, *aa*. Fig. 2, a side view, also partly open; and fig. 3, an isometrical view of the mould prepared for pouring in the metal.

The metal or cast being removed from the mould, a pair of the dies (one only of each pair is represented), according to the pattern required, figs. 4, 5, 6, 7, are placed in the machine, as seen at *cc*, fig. 8, isometrical view. After they are put in, a thin iron cover (*b*, fig. 10), with an oblong hole in the middle, is put on to guide the metal into the rollers. Figs. 9, 10, and 11, represent three views of the machine as prepared for operating. In figs. 9 and 11, the metal, *dd*, is represented passing through the machine, which is accomplished by turning the winch handle, *ee*, acting on two equal sized toothed wheels, *ff*. On the axles of these are two rollers, *gg*, slightly serrated (dotted through in figs. 8 and 10); these rollers draw the metal through, while the dies give the desired form. To allow the axles and rollers to be placed in the frame or body of the machine, A, the cover, *h*, is removed by unscrewing the bolt, *i*, figs. 8, 10, 11. The toothed wheels, *ff*, are also taken off, by unscrewing the nuts, *kk*. The tempering screw bolt, *l*, is for adjusting the dies after they are put in their place. The screw bolts, *mm*, are for fixing the machine to a table or bench.

Fig. 12 is an isometrical view of the cover, *h*, removed to show the ports, *nn*, through which the axles of the rollers pass.

Fig. 13 shows the shape of the bolt used for soldering the lead windows, and fig. 14 the opener already described.

The lead intended to be employed in window making must be soft, and of the very best quality; and great care must be taken to have the moulds properly tempered, otherwise the lead will not be equally diffused in them, and the castings consequently not perfectly solid throughout, as they ought to be.

If this is not attended to, that is, if the castings are not perfectly solid, they will come out of the mill, to which they are presented after being taken from the moulds, all fretted on the edges, and thus in a state totally unfit for the purpose for which they were intended.

The castings are, as already noticed, usually about eighteen inches in length, and are afterwards extended by the mill represented by the figure above, to the length of five or six feet.

It may not be unnecessary to add, that the mill not only extends the lead, and reduces it, at the pleasure of the operator, to the dimensions required, but at the same time forms the grooves into which the edge of the glass is afterwards introduced in forming the window.

When the lead has been prepared in the manner described, the glazier ought to proceed to cut out the panes wanted. For this operation he must prepare by first outlining the full dimensions of the window, and then lining it off to the pattern required, shaping the panes accordingly. If the window is of a large size, this may be done by compartments, to be afterwards united, and thus be more conveniently wrought. Great accuracy must be observed in cutting the panes, or a very irregular panel will be produced, as those lines that ought to be parallel or otherwise will not be correctly so, which will greatly injure the appearance of the work.

When all the glass has been cut for the window, the next thing to be done is to open the grooves in the lead with the opener or wedge tool. The panes are then, in order that they may be water-tight, fastened very firmly into the grooves with the wooden fillet already spoken of (which may be fixed on the handle of the chisel or cutting tool), the parallel lines of lead being secured in their proper places on the board, when the window is of the diamond shape, by a small nail at either end, until the course is finished, when the work is permanently fastened by running a small quantity of solder gently over the two connecting pieces of lead at each joint, or angular point. When the window has been completed, it should be removed from the working board to a flat table, and there covered with a thick layer of cement, composed of white lead, lamp black, red lead, litharge, and boiled linseed oil, with a half-worn paint brush, and the composition carefully rubbed into every joint. This will render the window completely impervious to the weather, as the cement, if properly laid on, will fill every chink, where it will soon become as hard and durable as any other of the materials of which the window is composed. When this operation has been completed, clean the window with a cloth and whiting. Should the outside be wanted black, omit the blacking in the first compost; and finish by laying on the lamp black with a polishing brush.

The window, on being fitted into the frame, that is, on being set in its place in the building for which it is intended, ought to be supported with three-eighth inch iron rods, extending three eighths of an inch beyond the breadth of the frame on each side, running across it at the distance of from twelve to fourteen inches from each other, and secured to the lead frame-work at intervals, either with copper wire, or lead bands manufactured by the mill. These rods, for obvious reasons, ought to be so arranged as to intersect the window exactly at the terminating point of a row of the diamonds. For instance, if the diamonds are each six inches in length or height, the first rod ought to intersect the window at the top of the third row, or eighteen inches from the bottom of the frame, and so on, until the window be equally divided in this way throughout its whole length. If the diamond, again, be only three inches in length, then the first rod ought to pass at the top of the fourth row, or twelve inches from the bottom, this proportion of distance being, of course, maintained throughout. The usual distance is fourteen inches, but this must be regulated by the breadth of the window between the mullions. If the mullions are of stone, the grooves in which the window is set ought to be filled up with Roman cement, or mastic. If of wood, with oil putty.

THE CUTTING DIAMOND.

Before the introduction of the diamond as an agent in cutting glass, that operation was performed by means of emery, sharp pointed instruments of the hardest steel, and sometimes red-hot iron. These were the only contrivances known and practised by the ancient glaziers.

In considering the diamond in its relations to the purposes of the window-glass cutter, there occur some circumstances not unworthy of remark. Amongst these, it may be noticed, that the cutting point of the diamond must be a natural one; an artificial point, however perfectly formed will only scratch the glass, not cut it. The diamond of a ring, for instance, will not cut a pane, but merely mark it with rough superficial lines, which penetrate but a very little way inwards. Artificial points, corners, or angles, therefore, produced by cutting the diamond, are adapted only for writing or for drawing figures on glass, and such were those used by Schwanhard, Rost, and the other old artists who were celebrated for ornamenting glass vessels. The cutting diamond does not write so well on glass, from the circumstance of its being apt to enter too deeply, and take too firm a hold of the surface, and thus become intractable. It may further be noticed, that an accidental point produced by fracturing the diamond, is as unfit for cutting as an artificial one. Such a point will also merely scratch the glass. No point, in short, that is not given by the natural formation of the mineral, will answer the purposes of the window-glass cutter.

The large sparks, as the diamonds used for cutting glass are called, are generally preferred to the small ones, from the circumstance of their being likely to possess, although this is by no means invariably the case, a number of cutting points; while the very small sparks are not always found to possess more than one. Thus, if the point of the latter is worn or broken off, although the spark be turned, and reset in its socket, it will still be without the power of cutting, and consequently useless, while the former, on undergoing the same operation, will present a new and effective point.

The large sparks are called *mother sparks*, and are sometimes cut down into as many smaller fragments bearing the same name, as there are natural points in them. Each of these, therefore, can have only one cutting point, and are consequently only proportionately valuable to the glazier, since they cannot be restored by resetting.

The Setting of Diamonds is a process with which every glazier ought to be acquainted; nor is it an art of difficult acquirement; some practice, and a little patience, are all that is necessary.

After having selected a stone, as clear and pellucid as possible, resembling a drop of water, and of an octoedrical shape, or as near to that form as it can be procured, the workman proceeds to ascertain which is its cutting point, or, if it has more than one, which is the best. This will be found to be that point which has the cutting edges of the crystal placed exactly at right angles to each other, and passing precisely through a point of intersection made by the crossing of the edges.

He then provides a piece of copper or brass wire, a quarter of an inch in diameter, having a hole drilled in one of its ends large enough to contain three fourths of the diamond to be set. Having temporarily secured the diamond in this hole, the setter ascertains the cutting point, by trying it on a piece of glass; and when he has discovered it, he marks its position by making a slight notch in the wire with a file or otherwise, exactly opposite to the cutting point, as a guide to him in his operations when he comes to fix it permanently in the socket head of the handle. When doing this, care is taken to keep it exactly parallel with the inclined plane of the socket head.

The cutting point having been ascertained, and the diamond fixed into its place, the wire is then cut off about a quarter of an inch below the diamond, and filed down to fit exactly into the aperture in the socket head, into which it must be soldered. The rough or superfluous metal around the stone is removed with a file; and, lastly, the setting is polished with emery or sand paper. Such is the most approved method of setting new diamonds, and it applies equally to the resetting of old ones. But in the latter case, the first process, that of detaching the stone from its bed, is accomplished either by means of a knife, or by applying the blowpipe.

The art of managing the diamonds in glass-cutting, so as to produce effective results, can only be attained by considerable experience. The diamond must be held in a particular position, and with a particular inclination, otherwise it will not cut, and the slightest deviation from either renders an attempt to do so abortive. In the hands of an inexperienced person, it merely scratches the glass, leaving a long rough furrow, but no fissure. The glazier judges by his ear of the cut made. When the cut is a clean and effective one, the diamond produces, in the act of being drawn along, a sharp, keen, and equal sound. When the cut is not a good one, this sound is harsh, grating, and irregular. On perceiving this, the operator alters the inclination and position of his diamond, until the proper sound is emitted, when he proceeds with his cut.

Although the diamond cuts glass of an ordinary thickness with facility, it does not easily cut that which is of more than a medium thickness. In such cases, the desired division is effected by the application of a hot iron, which being brought in contact with the glass at certain points, produces a fissure in the direction required.

The diamonds employed in glass-cutting, are of the description known by the technical name of *bort*, a classification which includes all such pieces as are too small to be cut, or are of a bad colour, and consequently unfit for ornamental purposes. These are accordingly selected from the better sort, and sold separately, at an inferior price.

Though there are many substances that will scratch glass, the diamond was thought to be the only one that would cut it; but some experiments of Dr Wollaston have shown that this is not strictly correct. That eminent philosopher gave to pieces of sapphire, ruby, spinel ruby, rock crystal, and some other substances, that peculiar curvilinear edge which forms the cutting point in the diamond, and in which, and in its hardness, its singular property of cutting entirely lies, and with these succeeded in cutting glass with a perfectly clear fissure. They lasted, however, but for a very short time, soon losing their edge, although prepared at a great expense of labour and care; while the diamond comes ready formed from the hand of nature, and will last for many years.

MANUFACTURE OF FLINT-GLASS OR CRYSTAL.

This is the species of glass of which the finest and most beautiful articles used for domestic purposes or for ornament are made. It is also largely employed in the manufacture of optical glasses, and for other philosophical purposes. It is the heaviest, the most brilliant, and also the most costly, of all the vitrified compounds. In order to convey an idea of the manufacture of flint-glass, we propose to give an account of a work in the vicinity of Edinburgh. Our description will be best understood by fre-

Flint-Glass.

quently referring to Plate CCLXXI. Fig. 1 represents a cone twenty-two feet two inches in diameter at the bottom, eight feet diameter at the top, and sixty feet in height. It contains twelve arches; *a* is a front view of one of them. Each of these arches contains one pot, and the whole of them are heated by means of flues which ramify round the whole cone, proceeding from one general furnace. The furnace, which is circular, is fifteen feet four inches in diameter, and six feet in height inside to the centre of the crown. Fig. 2 represents a pot which is manufactured of Stourbridge clay, of the best quality. From the bottom to the highest part the pot is thirty-eight inches in height, and the width outside thirty-four inches. The orifice of the pot measures about eight inches across. About fourteen hours are necessary before the pots can all be filled, on account of the metal sinking into less bulk as it melts. During the whole time the furnace must be kept as hot as possible. After the pots are all filled, about forty-four hours elapse before the vitrified mass is brought to a proper state for working. More or less time is necessary according to the state of the materials, and from time to time the pots must be carefully scummed in order to remove any impurities.

As in every other branch of glass making, the proportions of the ingredients used for making flint-glass vary with almost every manufactory. The following is reckoned an excellent compound. Fine white sand, six hundredweights and a half; red lead or litharge (*minium*), three hundredweights and a half; calcined potash, two hundredweights; nitre, eighty-four pounds; manganese, from eight to eighteen ounces, according to circumstances; arsenic, from one to two pounds; cullet, or broken crystal, a quantity sufficient to fill up the pots. The above quantities of materials fill two pots. On the authority of the Messrs Aikin,[1] a very excellent article may be made from 120 parts of fine white sand, forty parts well purified pearl ash, thirty-five parts litharge, thirteen parts nitre, and a small quantity of black oxide of manganese. The principal difference between flint and other kinds of glass is in there being present in its composition a considerable quantity of some metallic oxide. All metals in a state of oxidation will combine with silica and an alkali to form glass. Only lead and bismuth, however, can be employed in sufficient quantity so as to produce a bright colourless article. The other metals impart various hues to the mass. Lead being the cheapest of the two metals, is that universally employed. If it be used, however, in too great a quantity, it will not only tinge the glass of a yellow colour, but produce an inconveniently soft material.

After the metal has been brought to a state when it is fit for being wrought, the workmen commence operations. The implements which they use are few in number and simple in construction. The first tool required is a hollow iron tube between four and five feet in length, and one eighth of an inch in the bore; it is technically called the *iron*, and is dipped into the pot in the manner represented in Plate CCLXXI. figs. 5 and 6. After a sufficient quantity has been collected on the end of this rod, it is withdrawn from the pot and suspended for a few seconds in a perpendicular position, that the glass, which is at the under end, may be lengthened out beyond the rod. It is then rolled upon the marver. This process, by which the glass is rolled into a cylindrical form, is represented by fig. 7. The glass is now of a consistency to admit of its being blown into a hollow globe, as exhibited in fig. 8. The globe, however, not being rendered sufficiently thin by this first distension, it is repeated until the vessel has assumed the dimensions required. In every case of blowing, the pressure of the breath must be continued upon the tube for a short while, to prevent the globe from collapsing, which would be the case were the confined air allowed to escape. The external pressure would be greater than the resistance offered from within. If it is required to elongate the globe, this may be effected by dexterously whirling it in a circular manner through the air. The crystal is now in a fit state for lying horizontally upon the *chair arms*, as shown in figs. 9 and 10. The chair arms are merely two pieces of wood lying parallel to each other upon the workman's seat or chair. The arm which lies next the heated metal is protected from injury by being covered with an iron plate. Another instrument, called a *punty* or "pontil," is employed. This is a solid iron rod of a cylindrical shape, and smaller and lighter than the hollow tube at first used. A small quantity of melted glass is collected upon one end of this by an assistant, and applied to the end of the globe, as shown in fig. 9. The two masses of glass are thus united together, and that attached to the hollow tube is easily separated from it by touching it near to where the tube enters the globe, with a small piece of iron wetted with water. By this means the glass cracks, and a smart blow upon the iron tube completes the disunion. The workman now takes the punty from his assistant, and laying it upon the chair arms, rolls it backwards and forwards with his left arm, whilst with his right he moulds it into the various shapes required, by means of a very few simple instruments. By one of these, called a *procello*, the blades of which are attached by an elastic bow, like a pair of sugar tongs, the dimensions of the vessel can be enlarged or contracted at pleasure. Any superfluous material is easily cut away by means of a pair of scissars, glass when red hot being very easily divided. For smoothing and equalizing the sides of the vessel, a piece of wood, generally cedar, is used; and the workman is also furnished with compasses and graduated scale, to ensure the regularity in shape and size required. The article being finished, is detached from the punty in the same way as formerly, and weighed in a pair of scales to see that there has been the proper quantity of glass consumed in its manufacture. It is then carried by means of a pronged stick to the annealing oven, or *lier* as it is technically called.

The process of annealing is one of the last importance; because, were glass not properly annealed, it would crack with even very slight changes of temperature; see the article ANNEALING in this work. Plate CCLXXI. fig. 3, represents an annealing oven. It is simply a long, low, rectangular chamber, heated at one end, and provided with various shallow iron trays, which can be passed along the bottom of the chamber. Upon these trays the manufactured goods are put; and the lier pans, as they are successively filled, are pushed towards the colder end of the oven, from whence they are taken in a state little warmer than the temperature of the external atmosphere.

Glass Cutting.—The cutting, or rather the grinding of crystal, forms a distinct business in a flint-glass-house. In the manufactory before alluded to, steam power is employed to give motion to the machinery by which the process of cutting is effected. A shaft proceeding from the engine causes the revolution of several large drums, which run along each side of the cutting room. Upon these drums belts run, which proceeding upwards, pass over smaller wheels (such as *a*, fig. 4). By this means the cutting wheel *b* is made to revolve with great celerity. Opposite it the workman is placed, and applies to the surface of the wheel the article which is to be cut. Above the cutting wheel is a conical-shaped vessel *c*, made of wood, and filled with fine sand, which being moistened with water, runs arough upon the cutting wheel at the lower extremity, in regular discharge. The hole in the bottom is of such imensions, and so situated, as to admit the escape of the equisite quantity of moistened sand. Below the wheel is vessel, *d*, which receives the sand and water run down pon the wheel. Every one who has seen a crystal shop, ıust have remarked the infinitely varied appearances which ie articles formed of flint-glass present. It is evident iat, to produce these, the wheels must be of very various rms, broad, narrow, flat edged, mitre-edged, that is, hav- g two faces, which form a sharp angle at their point of eeting, convex, concave, &c. They are made of iron oth cast and malleable, of Yorkshire stone, and of willow ood. The iron wheels are used in the roughest part of e operations, and articles ground by these are further noothed down by a wheel of Yorkshire stone. Wooden heels are employed in the further smoothing and polish- g of the crystal. For smoothing the surface, the edge the wheel is dressed with either rotten stone or pumice one; and for imparting to it the highest degree of polish, itty powder is employed.

---

[1] *Dictionary of Chemistry*, vol. i. p. 496.

There are certain crystal shades in use for softening the ght diffused by lamps. The process by which this lessen- g of the transparency is effected is called frosting. The ughness is imparted to the inner, not the outer surface the vessel; and it is done by the former being fixed in a the, and rubbed by a workman with a piece of wood co- red with wet sand.

BOTTLE-GLASS.

Bottle-Glass.

Plate CCLXVIII. fig. 4, is a ground plan, showing all e necessary buildings for two bottle-houses, and in one the houses the ground plan of a four-pot furnace and h arches. The furnace is an oblong square, similar to iat we have described the crown-furnace to be, but arch- over in the barrel shape. It is erected in the centre of e brick cone, above a cave, which admits the atmo- here to the grating. The working holes of this furnace, posite each pot, for putting in the materials and taking t the liquid glass, are each about one foot in diameter. t each angle of the furnace there is also a hole about the me size communicating with the calcining arch, and mitting the flame from the main furnace, which re- rberates on and calcines the materials in the arch. Fig. 1 ows the main furnace; 2, 3, 4, 5, the ash arches for lcining the materials; 6, 7, 8, 9, 10, 11, annealing arch- ; 12, two-pot arches; 13, what is considered an improv- plan; 14, clay-house, for picking, grinding, sifting, and erwards working the clay into paste for the purpose of anufacturing pots; 15, mill house for grinding clay; 16, building containing a calcar furnace for experiments, for preparing the materials, when the ash arch attached the main furnace is under repair, including, 1, a sand crib, d 2, an ash crib for sifting and mixing the materials, suffi- ent for two houses.

The common green or bottle glass is made of the coarsest terials; sand, lime, sometimes clay, any kind of alkali alkaline ashes, whose cheapness may recommend it to e manufacturer, and sometimes the vitreous slag produ- d from the fusion of iron ore. The mixture most com- only used is soap-maker's waste, in the proportion of three easures to one measure of sand. The green colour of is glass is occasioned by the existence of a portion of n in the sand, and, it may be, also in the vegetable ashes which it is composed.

To distinguish it from flint-glass, which pays a higher ty, government does not allow the use of any but the arsest kind of sea or river sand. When castor oil or ampaigne bottles are wanted, a portion of crown-glass llet is added, to improve the colour. The impurity of the alkali, and the abundance of fluxing materials of an earthy nature, combined with the intense heat to which they are subjected, occasion the existence of but a very small proportion of real saline matter in the glass; and thereby render it better than flint-glass for holding fluids possessing corrosive properties.

The soap-maker's waste is generally calcined in two of the coarse arches, figs. 3 and 4, which are kept at a strong red heat from twenty-four to thirty hours, the time required to melt the materials and work them into glass, which is termed a journey. After the soap-maker's waste is taken out of the arch, it is ground and mixed with sand in the proportions already mentioned. This mixture is put into the fine arches, and again calcined during the working journey, which occupies about ten or twelve hours more. When the journey is over, the pots are again filled with the red-hot materials out of the fine calcining arch. Six hours are required to melt this additional quantity of materials. The pots are again filled up, and in about four hours this filling is also melted. The furnace is then kept at the highest possible degree of heat, and in the course of from twelve to sixteen hours, according as the experience of the founder may determine, the materials in the pots are formed into a liquid glass fit for making bottles. The furnace is now checked by closing the doors of the cave, and the metal cooling, it becomes more dense, and all the extraneous matter not formed into glass floats upon the top. Before beginning to work, this is skimmed off in the way already described in our account of crown-glass making. A sufficient quantity of coals is added at intervals, to keep the furnace at a working heat till the journey is finished.

After the pots have been skimmed, the person who begins the work is the gatherer, who, after heating the pipe, gathers on it a small quantity of metal. After allowing this to cool a little, he again gathers such a quantity as he conceives to be sufficient to make a bottle. This is then handed to the blower, who, while blowing through the tube, rolls the metal upon a stone, at the same time forming the neck of the bottle. He then puts the metal into a brass or cast-iron mould of the shape of the bottle wanted, and, continuing to blow through the tube, brings it to the desired form. The patent mould now in use is made of brass, the inside finely polished, divided into two pieces, which the workman, by pressing a spring with his foot, opens and shuts at pleasure. The blower then hands it to the finisher, who touches the neck of the bottle with a small piece of iron dipt in water, which cuts it completely off from the pipe. He next attaches the punty, which is a little metal gathered from the pot, to the bottom of the bottle, and thereby gives it the shape which it usually presents. This punty may be used for from eighteen to twenty-four dozen of bottles. It is occasionally dipped into sand to prevent its adhering to the bottle. The finisher then warms the bottle at the furnace, and taking out a small quantity of metal on what is termed a ring iron, he turns it once round the mouth, forming the ring seen at the mouth of bottles. He then employs a shears to give shape to the neck. One of the blades of this shears has a piece of brass in the centre, tapered like a common cork, which forms the inside mouth; to the other blade is attached a piece of brass, used to form the ring. The bottle is then lifted by the neck on a fork by a little fellow about ten years of age, and carried to the annealing arch, where the bottles are placed in bins above one another. This arch is kept a little below melting heat, till the whole quantity, which amounts to ten or twelve gross in each arch, is deposited, when the fire is allowed to die out.

Such is a brief view of the various methods of manufacturing glass. The physical properties of this useful sub-

Duties.

stance will naturally fall to be treated of under the heads of the several sciences in which glass is employed.

The manufacture of glass is subjected to the excise laws; and the duties are not only very heavy, but the regulations for levying them are most complex and oppressive. The injuries which are inflicted upon trade by such a system of taxation are strikingly exemplified in the case of glass. In 1794, when the duty was L.1. 1s. 5d. per cwt. for plate and flint, the other kinds being taxed in proportion, the quantities paying duty were as follow: Flint and plate, 67,615 cwt.; broad, 20,607; crown, 83,940; bottle, 227,467. The duties were successively raised, until in 1813 they amounted to L.4. 18s. The result of this was, that in 1816 the consumption had declined to, plate, 29,600; broad, 6140; crown, 55,502; bottle, 155,595.

In 1825 the duty was reduced one half, and the consumption rose to about what it was in 1794. But since the wealth and population of the country have more than doubled since that period, and as general luxury has been greatly extended, the manufacture of glass ought to have been nearly trebled. This would certainly be the case were the duties lowered or abolished. The following accounts show the pernicious influence of the existing duties:

I.—*Account of the number of Glass-Houses respectively employed in the Manufacture of Broad, Crown, Flint, Plate, and common Bottle Glass, in each year from* 1829 *to* 1832 *inclusive, in the United Kingdom.*

Years.	Broad Glass.	Crown.	Flint.	Plate.	Common Bottle-Glass.
1829	2	28	54	3	42
1830	2	25	54	2	39
1831	2	24	55	2	36
1832	2	28	59	2	39

II.—*Account of the Quantities of Flint, Plate, Broad, Crown, and Bottle Glass, charged with the Duty in each year from* 1829 *to* 1832 *respectively, with the Rates of Excise Duty and Revenue accruing thereon.*

Years.	Flint-Glass.	Rate of Duty.	Plate.	Rate of Duty.	Broad.	Rate of Duty.	Crown.	Rate of Duty.	Bottle-Glass.	Rate of Duty.	Gross Duty.			Drawback.			Revenue.

We can only notice a few of the regulations as to the manufacture of glass. Every glass-maker must take out an annual license, which costs him L.20 for each glass-house; and he must make entry at the next excise-office, of all work-houses, furnaces, pots, pot-chambers, annealing arches, warehouses, and the like, under a penalty of L.200. Previously to the charging of the pots, twelve hours' notice must be given in writing, of the time of beginning, the weight of metal, and the species of glass, on pain of L.50. If any material or preparation be put into a pot after notice has been given and a gauge taken by the officer, penalty of L.50 is incurred; and if the manufacture be of flint-glass, the penalty is L.200. The officers are allowed to have access to the works at all hours by day and night, any attempt to obstruct them incurring a penalty of L.200; and the counterfeiting, altering, or effacing any marks made by them being visited with a penalty of L.500; connivance at its being done subjects the aggressor to a fine of L.200. The whole of the metal intended to be manufactured into common-glass bottles is to be worked within sixteen hours next after the same shall be begun; and when the bottles are put into the annealing arches, manufacturers are then, in the presence of the officer, to charge the pots with fresh materials, other than broken glass, not less than fifty pounds weight; and declarations are to be delivered in writing, of the number of such bottles, on penalty of L.100. Fraudulent weighing of glass is visited with a heavy penalty. Notices are not to be given for drawing out bottles, but only between eight o'clock in the morning and six o'clock in the afternoon. No crown-glass, German sheet-glass, or broad window-glass, can be manufactured beyond the thickness of one-ninth part of an inch, without being subjected to the duty paid on plate-glass. Such are a few of the laws and regulations, alike vexatious and impolitic, which have retarded the progress of glass-making, and that too at a time when almost every other species of manufacture had far more than doubled itself. In fact, from the making of the pots themselves to the packing up of the glass for sale, every thing is done after a certain manner, which is determined by act of parliament. This being the case, how improvements are to be made in the art it is difficult to conceive. The laws which regulate the packing and exportation of glass are equally burdensome with those relative to its manufacture. The amount of drawback allowed upon this article will be seen from the table above given.

Glatz
||
Glauber.

Engraving on Glass. Professor Beckmann has proved, at, as early as the year 1670, the art of etching upon ass was discovered by Henry Schwanhard, son of George chwanhard, who was a celebrated glass-cutter, patronis- by the Emperor Ferdinand III. about the middle of e last century. At the time of his death, 1697, the fa- er practised his art at Prague and Ratisbon. Whether e son followed the same business at the same towns, or moved to Nuremberg, is not very evident; but in the ar above mentioned, some *aqua-regia* (nitro-muriatic id) having accidentally fallen on his spectacles, he was rprised to find the glass corroded by it, and become ite soft. He thus, it is said, found himself in posses- n of a liquid by which he could etch writing and figures on plates of glass.

But it is probable, as Beckmann seems to think, that he d discovered the fluoric acid itself; for in the year 1725 ere appeared in a periodical work the following receipt r making a powerful acid, by which figures of every kind n be etched upon glass.

“ When the *spiritus nitri per distillationem* has passed to the recipient, ply it with a strong fire, and when well phlegmated, pour it, as it corrodes ordinary glass, into Weldenberg flask. Then throw into it a pulverised green ohemian emerald, otherwise called *hesphorus* (which, en reduced to powder, and heated, emits in the dark a een light), and place it in warm sand for twenty-four urs. Take a piece of glass well cleaned, and freed from grease by means of a ley; put a border of wax round about an inch in height, and cover it all over with the ove acid. The longer you let it stand so much the bet- r; and at the end of some time the glass will be corrod- l, and the figures which have been traced out with sul- ur and varnish will appear as if raised above the pane glass.”

That the Bohemian emerald, or *hesphorus*, mentioned in is receipt, is green sparry fluor, cannot, says the profes- r, be doubted; and he seems to have as little doubt of e receipt itself having passed from Schwanhard and his holars to the periodical work of 1725, from which it was serted in the Oekonomische Encyclopädie of Krunitz. his supposition certainly acquires a considerable degree probability from the similarity of Schwanhard's method etching to that which is here recommended, and which so different from what is now followed. At present the ass is covered with a varnish either of isinglass dissolv- l in water, or of turpentine oil mixed with a little white ad, through which the figures to be etched are traced on copper; but Schwanhard, when he had drawn his gures, covered them with varnish, and then by his liquid rroded the glass around them. His figures, therefore, hen the varnish was removed, remained smooth and ear, appearing raised from a dim or dark ground; and . Beckmann, who had persuaded some ingenious artists make trial of this ancient method of etching, declares at such figures have a much better effect than those hich are cut into the glass.

GLASTONBURY, a town of Somersetshire, in the undred of Glaston Twelve Hides, 130 miles from Lon- on. It is situated in a district of peculiar fertility, and uch of the pasture land within the two parishes of which e town consists is of higher value for fattening cattle an any other in the rich county in which it stands. his place was once an island, called in Latin Avalonia. was surrounded by water forced up by the strength of e tide, but embankments having been made and drains onstructed in very remote ages, the land has been converted into rich pasture. This was effected by the abbot and his monks, who, notwithstanding the vast expenditure lavished upon their abbey, were the great leaders of the agricultural improvements of their age.

The abbey, founded at a very early period, was, for extent and wealth, the next to that of Westminster. The abbot was a lord of parliament; and the ruins which remain are sufficient proofs of the magnificence of the whole establishment. Although, as might be expected from its age, the abbey is in a dilapidated state, yet the architectural beauty of what remains, and especially that of the chapel, causes the whole to be visited with eager curiosity. The abbot's kitchen is tolerably perfect, and the eastern window of the chapel is worthy of admiration. The legend of the visit of Joseph of Arimathea, and his budding staff converted into a thorn, blooming at Christmas, is well known; as well as that of St Dunstan having taken the devil by his nose with a pair of red hot tongs. Both are related of this place, though the first is doubted and the second ridiculed.

Near the town, upon an insulated and lofty mount, Glastonbury tower is visible from all parts of the surrounding country. It was formerly an oratory, dedicated to St Michael, and afterwards enlarged so as to form a magnificent church and monastery, both of which were destroyed by an earthquake in 1271. Many of the private buildings in the town still display curious decorations of carved work of very ancient date. The present town contains two parish churches, dedicated to St John and to St Benedict. It was an ancient corporation, and returned members to parliament till the year 1539, when the abbot was put to death, and that charter taken away; but a new charter was granted in the reign of Queen Anne, under the powers of which the town is governed by a mayor, eight aldermen, and sixteen burgesses. The market is held on Tuesday, and is but thinly attended. The population amounted in 1801 to 2035, in 1811 to 2340, in 1821 to 2630, and in 1831 to 2984. There is now but little trade in the town, and the making of stockings, which once afforded employment, is nearly lost. Being on the great road leading from Bristol and Bath to Exeter and Plymouth, there is much travelling, especially of late years, since the roads have been improved.

GLATZ, a strongly fortified city, the capital of a circle of the same name, in Prussian Silesia. It stands on a sand hill above the river Neisse, and is defended by two powerful forts, which command the passes from Austria. It contains five Catholic and two Lutheran churches, several barracks, and 889 houses, with 8231 inhabitants, exclusively of the garrison. It is a place where many manufactories are carried on, especially that of damask table linen, and other goods, both of linen and woollen; also soap-boiling, tannery, and distilling. Long. 16. 34. E. Lat. 50. 23. N.

GLAUBER, John Rodolph, a German chemist, born at the commencement of the sixteenth century, was one of those who were most ardently occupied with “the great work,” namely, the discovery of the philosopher's stone. Full of love and enthusiasm for the marvellous, he abandoned himself without reserve to the extravagant ideas which then prevailed in chemistry. His long and painful labours, pursued with indefatigable perseverance, and an energy worthy of a nobler object, were almost always directed towards the discovery of the panacea, the philosopher's stone, and other chimeras with which the alchymists amused the imagination. Infatuated with the doctrine of the adepts, he may be said to have passed his life over alembics and furnaces, and, in fact, he is regarded as a second Paracelsus. Not less presumptuous than his model, he boasted of the discovery of several wonderful secrets. Whether he was truly convinced of the reality of his inventions, or whether, like empirics of all classes, he proposed to profit by the ignorance and blind credulity of men, he had the art to seduce many persons by promises as vain as they were exaggerated. He is even reproached with having carried on a vile traffic in pretended secrets, which he sometimes sold at an exorbitant price to different individuals, and afterwards published with his name in order to enhance his reputation. Devoid of the instruction and force of mind necessary to enable him to deduce just inferences from the numerous experiments which he had performed with ability and address, Glauber only attained a subaltern or secondary rank amongst the chemists. But he, nevertheless, discovered several important facts, which have materially contributed to make better known certain salts and some metals, which, eventually, had a marked influence on the progress of chemistry and materia medica. Thus, in examining the residue of the decomposition of sea-salt by the sulphuric acid, this laborious chemist discovered the sulphate of soda, to which his name is irrevocably attached under the denomination of Glauber's Salt. His writings on dry baths and sulphurous fumigations entitle him, in certain respects, to be regarded as the inventor of confined vapour baths, which have been latterly brought forward as a new discovery; and he is equally the inventor of several chemical medicaments, the use of which is still preserved in most of the pharmacopœias. We are also indebted to him for a great number of works (thirty in all), an exact list of which may be found in the curious article entitled Glauber, in the fourth volume of Adelung's *History of Human Folly*. A collection of them was printed in several volumes 8vo, and in two volumes 4to, at Frankfort, 1658, 1659, and translated into English by Pack, London, 1689, in folio. Of these the principal are, 1. *Deutschlands Wallfahrt*, or Prosperity of Germany, Amsterdam, 1656, often reprinted; 2. *Furni Novi Philosophici*, or Description of a new Method of Distilling, Amsterdam, 1648, in 8vo, translated into French by Duteil, Paris, 1659, in 8vo; 3. De Medicina Universali, sive de Auro potabili vero, Amsterdam, 1658, in 8vo; 4. Miraculum Mundi, Amsterdam, 1653, in 8vo; 5. Pharmacopœia Spagyrica, Amsterdam, 1654, in 8vo; 6. De Tartaro ex Vini fœcibus, 1655, in 8vo; 7. Dissertatio Medica Hermetica et Catholica magni Naturæ magisterialis Mysterii, Frankfort, 1656, in 8vo; 8. Consolation of Navigators, Amsterdam, 1659, in 8vo; 9. Opus Minerale, Amsterdam, 1651, in 8vo; 10. De Elia Artista, Amsterdam, 1668, in 8vo. Glauber published many other alchymical productions, which are neither less obscure nor less enigmatical than the preceding, and in which vague hypotheses and chimerical conceptions supply the place of facts and of reasoning. All his works are in German; and although most of them have the first words of the title in Latin, there is good ground for believing that Glauber did not understand that language. (A.)

GLAUCHA, a city of the circle of Erzgeberg, in the kingdom of Saxony. It is in the form of a half moon, situated on the river Mulda, is walled, and contains 742 houses, with 4340 inhabitants, who are employed in the manufactures of various cotton goods.

GLAUCOMA, in *Medicine* and *Surgery*, the name of a disease in the eye, in which the crystalline humour is converted into a bluish or greenish colour, and its transparency thereby diminished. The word comes from γλαυκος, sea-green, sky-coloured, or greyish.

GLAUCUS, a marine god, or deity of the sea. There are a great many fabulous accounts of this divinity; but his poetical history is, that, before his deification, he was a fisherman of the town of Anthedon, and having one day taken a considerable number of fishes, which he laid upon the bank, he on a sudden perceived that these fishes, having touched a kind of herb which grew on the shore, received new strength, and leaped again into the sea; upon which he was tempted to taste of the herb himself, and presently leaped into the sea after them, where he was metamorphosed into a Triton, and became one of the sea-gods.

GLAZIER, an artificer who works in glass. The principal part of a glazier's business consists in fitting panes of glass to the sashes and window-frames of houses, pictures, and the like, and in cleaning the same.

GLAZING, the encrusting of earthen ware with a vitreous substance, the basis of which is lead.

The workers of common earthen ware, however, are not at the trouble of thus previously making a pure glass of lead. Their usual composition for glazing ware is formed, of white sand forty pounds, of red lead twenty pounds, of pearl ashes twenty pounds, and of common salt twelve pounds. The sand is powdered by grinding, and then the other ingredients are added and ground together; after which they are calcined for some time with a moderate heat, and when the mixture is cold it is reduced to powder, and when wanted for use tempered with water. The proportion of these ingredients may be occasionally varied. The ware, after being turned on the wheel and dried in the open air, is covered over with the above composition by means of a brush; and when set in the furnace the violent heat soon reduces it to a perfect glass, covering the whole internal and external surface of the vessel.

We may observe in general, however, that lead ought to be excluded from the composition of glazings, and other fluxes substituted in its stead. A transparent glazing may be prepared without lead, by calcining forty pounds of white sand, twenty-five pounds of pearl ashes, and fifteen pounds of common salt, and proceeding as before; and a more perfect transparent glazing may be made of sand forty pounds, of wood ashes perfectly burned fifty pounds, of pearl ashes ten pounds, and of common salt twelve pounds. The receipts annexed are taken for the most part from Kunckel, who says that they are the true glazings used at Delft, and in other Dutch manufactories.

Black is made of red lead eight parts, iron filings three parts, copper ashes three parts, and zaffer two measures. This when melted makes a brown black; and if it be wanted blacker, more zaffer must be added to it.

Blue is thus prepared; take lead ashes or red lead one pound, clear sand or powdered flints two pounds, common salt two pounds, white calcined tartar one pound, Venice or other glass half a pound, zaffer half a pound; mix them well together and melt them several times, quenching them always in cold water. If it be desired to have it fine and good, put the mixture into a glass furnace for a day or two.

Another blue glazing may be formed of one pound of tartar, a quarter of a pound of red lead, half an ounce of zaffer, and a quarter of a pound of powdered flints, which must be fused and managed as in the last receipt. Or, take two pounds of calcined lead and tin, add five pounds of common salt, five pounds of powdered flints, and of zaffer, tartar, and Venetian glass, each one pound; calcine and fuse the mixture as before. Or, again, take of red lead one part, of sand three parts, and of zaffer one part. For a violet-blue glazing, take four ounces of tartar, two ounces of red lead, five ounces of powdered flints, and half a drachm of manganese.

Brown is made of red lead and flints, of each fourteen parts, and of manganese two parts, fused; or of red lead twelve parts, and manganese one part, fused. A brown glazing, to be laid on a white ground, may be made of manganese two parts, and of red lead and white glass one part of each, twice fused. Flesh-coloured is made of twelve parts of lead ashes, and one of white glass. To prepare the gold-coloured, take of litharge three parts, of sand or calcined flint one part; pound and mix these well together, then run them into a yellow glass with a strong fire. Pound tis glass, and grind it into a subtile powder, which moisten vth a well-saturated solution of silver; form it into a ste, then put it into a crucible, and cover it with a lid. pply at first a gentle degree of fire; then increase, and ntinue it until a green glass has been obtained. Pound tis glass again, and grind it to a fine powder; moisten te powder with some beer, so that by means of a hair penc you may apply it upon the vessels or any piece of earthc ware. The vessels which are painted or covered over vth this glazing must first be well heated, then put under a muffle; and as soon as the glass runs, they must be soked, by holding them over burning vegetables, and ten taken out. Heinsius of St Petersburg, who sent this reeipt to the Royal Society, uses the words *afflare debes fnum*, which is rendered "smoke them," in the transactns. (*Phil. Trans.* No. 465, sect. 6.)

Kunckel gives several preparations for a gold-coloured yllow glazing. This may be produced by fusing a mixture three parts of red lead, two parts of antimony, and one prt of saffron of Mars; by again melting the powdered ass, and repeating the operation four times; or by fusing fur or five times a composition of red lead and antimony each an ounce, and of scales of iron half an ounce; or calcining and fusing together eight parts of red lead, s parts of flints, one part of yellow ochre, one part of antmony, and one part of white glass. A transparent goldloured glazing may be obtained by twice fusing red lead d white flints, of each twelve parts, and of filings of iron e part.

Green may be prepared from eight parts of litharge or l lead, eight parts of Venice glass, and four parts of brass st or filings of copper; or from ten parts of litharge, elve of flint or pebble, and one of *æs ustum* or copper hes. A fine green glazing may also be produced by fusing e part of the Bohemian granate, one part of filings of pper, one part of red lead, and one part of Venetian ass; or by fusing one part of white glass, and the same antity of red lead, and of filings of copper, powdering e mass, and adding one part of Bohemian granate to two rts of this powder. A fine green may likewise be obned by mixing and grinding together any of the yellow azings with equal quantities of the blue glazings; and all e shades and teints of green will be obtained by varying e proportion of the one to the other, and by the choice the kind of yellow and blue.

Sea-green is made of five pounds of lead ashes, one und of tin ashes, three pounds of flint, three quarters of pound of salt, half a pound of tartar, and half a pound of pper dust. Iron colour is prepared from fifteen parts of d ashes or red lead, fifteen of white sand or flints, and e of calcined copper. This mixture must be calcined d fused. Liver colour is prepared from twelve parts of harge, eight of salt, six of pebble or flint, and one of nganese. Purple brown consists of lead ashes fifteen rts, clean sand or powdered flints eighteen parts, mangase one part, and white glass fifteen measures, to which me add one measure of zaffer. Red is made of antimony ree pounds, litharge or red lead three, and rust of iron e, which are ground to a fine powder; or take two unds of antimony, three of red lead, and one of calcined ffron of Mars, and proceed as before.

The white glazing for common ware is made of forty unds of clear sand, seventy-five pounds of litharge or d ashes, twenty-six of potashes, and ten pounds of salt; d these are thrice melted into a cake, quenching it each ne in clear cold water. Or it may be made of fifty unds of clean sand, seventy of lead ashes, thirty of wood hes, and twelve of salt. For a fine white, take two unds of lead and one of tin; calcine them to ashes; of is take two parts, calcined flint, white sand, or broken ite glass, one part, and salt one part; mix them well together and melt them into a cake for use. The trouble of calcining the tin and lead may be prevented by procuring them in a proper state. A very fine white glazing may be obtained by calcining two parts of lead and one part of tin; and taking one part of this mass, and of flints and common salt one part each, and fusing the mixture. A white glazing may also be prepared by mixing a hundred pounds of masticot, sixty pounds of red lead, twenty pounds of calcined tin or putty, and ten pounds of common salt, and calcining and powdering the mixture several times.

Yellow is prepared of red lead three pounds, calcined antimony and tin two pounds of each; or, according to some, of equal quantities of the three ingredients. These must be melted into a cake, then ground to a fine powder, and this operation must be repeated several times; or it may be made of fifteen parts of lead ore, three parts of litharge of silver, and fifteen parts of sand. A fine yellow glazing may be procured by mixing five parts of red lead, two parts of powdered brick, one part of sand, one part of the white glazings, and two parts of antimony, calcining the mixture and then fusing it. Or take four parts of white glass, one part of antimony, three parts of red lead, and one part of iron scales, and fuse the mixture; or fuse sixteen parts of flints, one part of iron filings, and twenty-four parts of litharge. A light-yellow glazing may be produced with ten parts of red lead, three parts of antimony and three of glass, and two parts of calcined tin. A citron-yellow is made of six parts of red lead, seven parts of fine red brick dust, and two parts of antimony. This mixture must be calcined day and night for the space of four days, in the ash-hole of a glass-house furnace, and at last urged to fusion.

The Romans had a method of glazing their earthen vessels, which in many respects appears to have been superior to ours. The common brown glazing easily scales off, cracks, and in a short time becomes disagreeable to the eye; besides, it is very easily destroyed by acids, nor can vessels glazed in this manner be even employed to hold water, without part of it oozing through their pores. Lead is also very destructive to the human body; and if acids are unwarily put into vessels glazed with lead, the liquors will receive a dangerous impregnation from the metal. The Roman glazing, which is still to be seen upon urns excavated in several places, appears to have been made of some kind of varnish; and Pliny gives us a hint that it was made of bitumen. He tells us that it never lost its beauty, and that at length it became customary to glaze over statues in this manner. As this varnish sunk deep into the substance of the ware, it was not subject to those cracks and flaws which disfigure our vessels; and as it was not liable to be corroded by acids, it was not subject to any of the accidents which may ensue from the use of vessels glazed with lead.

GLEBE, amongst miners, signifies a piece of earth in which is contained some mineral ore.

Glebe, in *Law*, the land belonging to a parish church, besides the tithes.

GLENDALAGH, otherwise called *the Seven Churches*, anciently a celebrated town of Ireland, situated five miles north-west of Rathdrum, in the county of Wicklow, and province of Leinster. The name signifies the valley of the two lakes.

GLISSON, Francis, an English physician, born in 1597, at Rampisham, in the county of Dorset, was educated at Cambridge, and, during forty years, occupied the chair of medicine in that university. In 1634, he was admitted into the college of physicians in London, of which he afterwards became president; and, in 1639, this body appointed him professor of anatomy. He filled this situation with much credit at the commencement of the civil war, when he took refuge in Colchester; but after the surrender of that city to the parliamentary forces, he went to London, and became a member of that association of learned men which was afterwards transformed into the Royal Society. In 1650, he published his treatise *De Rachitide, seu morbo puerili*, a malady then new in England, where it had only appeared about thirty years before. Glisson was assisted in the composition of this treatise by Doctors Bate and Regemortes. In 1654, appeared his *Anatomia Hepatis*, in 8vo, with an appendix concerning the lymphatic ducts, then recently discovered; in 1672, the *Tractatus de natura substantiæ energetica, seu de vita Natura ejusque tribus primis facultatibus;* and in 1677, the year of his death, the book *De Ventriculo et Intestinis*, in 4to, the first work containing conjectures as to the nature of the simple fibre, and an exposition of the innate principle of irritability, as it is denominated by our author. Glisson was also the first who attributed the contraction of the heart, and of the other muscles, to the action of a stimulus on their irritable principle. He likewise treats largely and judiciously of the peristaltic and antiperistaltic motion. The greater part of his works have often been reprinted in different countries. They contain new methods and discoveries, amongst others that of the capsule of the *vena portæ*, at least he had the merit of being the first to examine and describe it with accuracy. He was also the author of a treatise *De Lymphæductis nuper repertis*, Amsterdam, 1659, which, and his book entitled *Anatomica prolegomena et Anatomia Hepatis*, are considered as the best of his works. Boerhaave regarded him as the most exact of all the anatomists; and Haller, speaking of one of his works, describes it as an excellent book, "like all those written by the same author." Glisson's views on physiology are now held in little estimation. (A.)

GLOBE, in *Geometry*, a round or spherical body, commonly called a *Sphere*.

GLOBE is more particularly used for an artificial sphere of metal, plaster, paper, or other matter, on the convex surface of which is delineated a map, or representation either of the earth or heavens, with the several circles of the sphere.

Globes are of two kinds, *terrestrial* and *celestial;* both of considerable use, the one in astronomy, and the other in geography, for performing many of the operations in these sciences, in an easy and obvious manner, so as to be conceived without any knowledge of their mathematical principles.

The fundamental parts, common to both globes, are an axis, representing that of the world; and a spherical shell, or cover, forming the body of the globe, on the external surface of which the representation is drawn.

GLOGAU, a city of Prussian Silesia, the capital of a circle to which it gives its name. It is situated on the left bank of the Oder, where the Dominsel falls into that river. It is strongly fortified, and has also a citadel. It contains the cathedral on an island in the Oder, eight other Catholic, and two Lutheran churches, one Reformed church, and 885 houses, with 10,253 inhabitants, of whom 1800 are Jews. It is a manufacturing city, and produces much linen and cotton goods; and it has tanneries, breweries, and other trades. Long. 16. 1. 25. E. Lat. 51. 38. N.

GLORY, renown or celebrity. The love of renown, or the desire of fame and reputation, appears to be one of the principal springs of human action. Glory, therefore, is not to be contemned, as some of the ancient philosophers affected to teach; but it imports us to regulate our pursuit of it by the dictates of reason; and if the public approbation follow not, the search must be abandoned. We ought to have our judgment well instructed as to what actions are truly glorious, and to remember, that in every important enterprise, as Seneca observes, *Recte facti fecisse merces est, officii fructus ipsum officium est*, the reward of a thing well done is to have done it, the fruit of a good office is the office itself. Those who by other methods contrive to place their names in many mouths, show that they rather seek after a great reputation than a good one, and their reward is oftener infamy than fame.

Men generally, and indeed almost instinctively, affix glory to such actions only as have been produced by an innate desire of public good; and this may be measured by that degree of influence which the thing done has upon the common happiness. If the actions of the hero conduct soonest to glory and with the greatest splendour, and if the victorious general is so great after a signal engagement, it is because the service he has performed is considered as a service done for all; and because we think without reflecting, that he has saved our habitations, our wealth, our children, and every thing that attaches us to life. If the man of science, who in his study has discovered and calculated the motions of the heavenly bodies, who in his alembics has detected some of the secrets of nature, or who has exhibited to mankind a new art, rises with less noise to fame, it is because the service which he renders is more widely diffused, and is often of less service to the present than to succeeding generations.

The consequences of these two advantages are, therefore, as opposite as the causes are different; and whilst the benefits secured by the warrior appear to exert no more influence, and his glory is obscured, that of a celebrated writer or inventor still increases, and becomes more and more enlarged. His works every day recall his name to the remembrance of those who read them, and thus still add to his celebrity and fame.

This posthumous fame indeed has been decried by some writers, and, in particular, the author of the *Religion of Nature delineated* has treated it as highly irrational and absurd. "In reality," says he, "the man is not known ever the more to posterity, because his name is transmitted to them; he doth not live, because his name does. When it is said Julius Cæsar subdued Gaul, conquered Pompey, &c., it is the same thing as to say, the conqueror of Pompey was Julius Cæsar; that is, Cæsar and the conqueror of Pompey is the same thing; Cæsar is as much known by one designation as by the other. The amount then is only this, that the conqueror of Pompey conquered Pompey; or somebody conquered Pompey; or rather, since Pompey is as little known now as Cæsar, somebody conquered somebody. Such a poor business is this boasted immortality, and such is the thing called glory among us! To discerning men this fame is mere air, and what they despise, if not shun."

But surely it were to judge a little too curiously to view matters thus. For, as is observed by the judicious author of Fitzosborne's Letters, although fame with posterity should be, in the strict analysis of it, no other than what is here described, a mere uninteresting proposition, amounting to nothing more than that somebody acted meritoriously; yet it would not necessarily follow, that true philosophy should banish the desire of it from the human breast; since this passion may be, as most certainly it is, wisely implanted in our species, notwithstanding the corresponding object should in reality be very different from what it appears in imagination. Do not many of our most refined and even contemplative pleasures owe their existence to our mistakes? It is but extending some of our senses to a higher degree of acuteness than we now possess them, to make the fairest views of nature, or the noblest productions of art, appear horrid and deformed. To see things as they truly are in themselves, would not always, perhaps, be of advantage to us in the intellectual world, any more than in the natural. But, after all, who shall certainly assure us that the pleasure of virtuous fame dies with its possessor, and reaches not to another scene of existence? There is nothing, it should seem, either absurd or unphilosophical in supposing it possible, at least, that the praises of the good and the judicious, the sweetest music to an honest ear in this world, may be echoed back to the mansions of the next; that the poet's description of Fame may be literally true, and that though she walks upon earth, she may yet lift her head into heaven.

To be convinced of the great advantage of cherishing this high regard to posterity, this noble desire of an after life in the breath of others, one need only look back upon the history of the ancient Greeks and Romans. For what other principle was it which produced that exalted strain of virtue in those days, which may well serve, in so many respects, as a model to these? Was it not the *consentiens laus bonorum*, the *incorrupta vox bene judicantium*, as Cicero calls it, "the concurrent approbation of the good, the uncorrupted applause of the wise," that animated their most generous pursuits?

In short, can it be reasonable to extinguish a passion which nature has universally lighted up in the human breast, and which we constantly find burning with greatest strength and brightness in the noblest and best constituted natures? Accordingly, revélation is so far from endeavouring to eradicate the seed which nature has thus deeply implanted, that it rather seems, on the contrary, to cherish and forward the growth thereof. To be "exalted with honour," and to be "had in everlasting remembrance," are among the number of those encouragements which the Jewish dispensation offered to the virtuous; and the person from whom the sacred Author of the Christian system received his birth, is herself represented as rejoicing that "all generations would call her blessed."

GLOSS, a comment on the text of any author, intended to explain his sense more fully, whether in the same language or in any other. (See the article COMMENTARY.) The word evidently comes from the Greek γλωσσα, tongue; the office of a gloss being to explain the text, as that of the tongue is to unfold the feelings and sentiments of the mind.

GLOSS is likewise used to signify a literal translation, or an interpretation of an author, word for word, in another language.

GLOSSARY, a dictionary, explaining the obscure and antiquated terms in some old author. Such are Du Cange's Latin and Greek Glossaries, Spelman's Glossary, and Kennet's Glossary at the end of his *Parochial Antiquities.*

GLOSSOPETRA, or GLOTTOPETRA, in *Natural History*, a kind of extraneous fossil, somewhat in the form of a serpent's tongue. It is frequently found in the island of Malta, and other places.

GLOUCESTER, a city, the capital of the county of the same name, 106 miles from London. It is situated in a rich and beautiful valley, on the banks of the river Severn. It is sheltered on the east by a range of hills, on descending which the vale displays itself, containing the verdant plains, the ancient buildings of the city, the winding river, and, in the distance, the group of picturesque eminences called the Malvern Hills. The city consists of four streets, distinguished by the names of the cardinal points, and crossing each other in the centre at right angles. They are broad, well built, clean, and excellently paved. The chief building is the cathedral, begun in 1047, and the ecclesiastical residences around it. That edifice was enlarged at subsequent periods, till it was erected into a bishop's see in the reign of Henry VIII. It is 4[illegible] feet in length, 144 in breadth, and adorned with a tower 199 feet in height. The interior has an impressive aspect, and is decorated with several monuments, and a lofty choir. It is a corporation, consisting of a recorder and twelve aldermen, one of whom is the mayor, and a large body of freemen, who elect two members to the House of Commons. This city gives the title of duke, which has been commonly conferred upon a member of the royal family. The principal manufacturing employment is making pins, great quantities of which are sent to London; but, besides this, making malt and cordage, and building barges, afford some occupation. There is a little foreign trade in the importation of wine, spirits, and West India produce; and this has been increased by the construction of a canal parallel to the Severn, which allows ships to avoid the shoals and sinuosities of that river. There is also some transit trade in iron ware, pottery, salt, and in timber, which descend the Severn from the counties to the northward. Some mineral springs, similar to those of Cheltenham, have lately been discovered, which have been resorted to by visitors, and have occasioned an increase of buildings appropriated for their reception. There are well-supplied markets on Wednesdays and Saturdays. The population amounted in 1801 to 7597, in 1811 to 8280, in 1821 to 9744, and in 1831 to 11,993.

GLOUCESTER is the name of several counties and towns in the United States of America. The counties will be described in the articles upon the several states where they are situated; and the towns are too unimportant to require separate notice.

GLOUCESTERSHIRE, one of the English counties on the western side of the kingdom. On the north-east it is bounded by Warwickshire, on the north-west by Worcestershire; Oxfordshire and Berkshire bound it on the east, Wilts and Somerset on the south, and Hereford and Monmouth on the west. The greatest length is seventy miles, and the greatest breadth thirty-five. Its area, including its rivers, is 1718 square miles, or 1,099,520 acres.

The number of inhabitants at each of the four decennial censuses has been as follows, viz.:—in 1801, 250,809; in 1811, 285,514; in 1821, 335,843; and in 1831, 386,700. In this enumeration the city of Bristol is included; for, though a part of it stands within the county of Somerset, yet in each of the parliamentary surveys it is considered as a part of the county of Gloucester, within which division the greater portion of it is situated. The most considerable places, and their population, are the following:

Bristol	103,886	Minchin-Hampton	7,255
Gloucester	18,376	Painswick	4,099
Cheltenham	22,942	Horsley	3,690
Stroud	8,607	Dursley	3,226
Tewkesbury	5,780	Newent	2,859
Bisley	5,896	Tetbury	2,939
Cirencester	5,420		

The foreign trade of this county is considerable, and centres chiefly in Bristol. Latterly, however, Gloucester has enjoyed a considerable share of it. This has been chiefly owing to the completion of a broad and deep canal parallel to the Severn, which admits vessels from sea to reach Gloucester. The principal trade from Bristol is to the West Indies, but both places maintain intercourse with America, Portugal, Spain, and other foreign territories, and import much wine, Merino wool, oil, and other commodities.

The internal trade of this county is, however, by far the most important. By the river Severn, which passes through it, it is enabled to maintain a regular intercourse with the potteries and glass manufactories of Worcestershire and Staffordshire, with the salt works of Droitwich, and with those parts of Warwickshire, Staffordshire, and Shropshire, which furnish the heavy iron goods that would not bear the expense of land-carriage. Though the Severn is not navigable except for flat-bottomed vessels, and for these only at spring tides, yet the craft on that river is very considerable; and at Stourport there is a connection with all the numerous canals which traverse the centre of the kingdom. Besides the river Severn, the Wye is navigable for small craft to a considerable distance from its mouth, and facilitates the commercial intercourse with Monmouthshire and Herefordshire.

Several navigable canals have been constructed in this county with the view of promoting its internal communication. The most remarkable of these is the Thames and Severn Canal, which communicates with the latter river through the Stroud Canal, and with the former river at the town of Lechlade. It was begun in 1783, and finished in ten years. The summit-level is two hundred and forty-one feet above the level of the Stroud Canal, and a hundred and thirty feet above the river Thames at the place of its junction. These rises of level are surmounted by locks, admirably contrived and executed; and in one place it passes under the park of Lord Bathurst, through Sapperton tunnel, and, after being buried for the distance of two miles and five furlongs, again emerges near Cirencester. The tunnel is lined with masonry, arched above, and at the bottom has an inverted arch, except in some very few places, where, passing through a solid rock, that expense has been spared. The breadth of the canal is forty-two feet at the top and thirty feet at the bottom, and it is constructed for barges adapted to the locks upon the river Thames, as well as those of the canal. The barges are twelve feet wide, from seventy to eighty feet long, and when loaded carry seventy tons, and draw about four feet of water. This work has, however, been more splendid than beneficial. The expense of its construction exceeded L.250,000, and the tolls are scarcely more than sufficient to defray the expense of the necessary repairs. In fact, it connects two rivers, the navigation of which is bad; but especially that of the Thames, which, before it reaches Oxford, is subject to great expense in horses to draw the barges; it has many shallows where the vessels must be lightened to pass over them, and is liable to frequent impediments, sometimes from a scarcity of water, and sometimes from inundations. The trade which once passed through this canal has been diminished by the opening of the Kennet and Avon, which forms a better medium for the transit of goods from Bristol or Gloucester to London. The Hereford and Gloucester Canal, designed to connect these two cities, passes near Boyce through a tunnel one mile and a quarter in length, between the Severn and Ledbury, to which place, a distance of seventeen miles, the rise is a hundred and eighty-three feet.

The mineral riches of this county are almost wholly confined to iron; for, though veins of lead exist at Sodbury, Deynton, and other places, they are not sufficiently productive of ore to induce the working of them. Iron is abundant in many parts of the county; but the principal forges are on the western side of the Severn, near Lydney, in the forest of Dean, where both charcoal and coal are abundantly produced. On both sides of the Severn coal is worked to a considerable extent. The forest of Dean contains upwards of a hundred and twenty coal pits, whence the city of Gloucester and its vicinity are supplied with that necessary article. At Kingswood, near Bristol, there are considerable veins, but these being at a great depth, the proprietors can scarcely compete with the miners of Monmouthshire, though by many of the inhabitants of the city the coals of Kingswood are preferred to those brought by water from Newport. The mineral springs in this county, at Clifton, at Cheltenham, at Stow-on-the-Wold, and at Bourton-on-the-Water, are well known; and the two former places, as well by their natural beauties as by their medicinal waters, attract considerable numbers of occasional visitors, who there find all those accommodations which the best watering-places can afford. No part of the kingdom produces better or more abundant stone than is raised from the quarries of Gloucestershire. Limestone of excellent quality extends from Cromhall south-east to Sodbury, and south-west to Aust-Cliff; and the rocks of Clifton yield an excellent stone, from which much lime is made, both for domestic consumption and for exportation to the West Indies. Freestone is found on the Cotswold Hills, and near Lydney some gritstones are raised, which are adapted by the mill-wrights to their purposes.

Gloucestershire is one of the chief manufacturing counties; and though a greater progress has been made of late years in the northern counties of Lancaster and York, it is still very much distinguished in this particular. The woollen manufacture has long been established in what are provincially called *the Bottoms*, a district in the valleys, between the range where the Cotswold Hills, with a less elevation, assume the name of the Stroud Hills. Between the ranges of these hills there are clear and rapid streams, which supply the mills in which the manufactures are carried on. The principal seats of the manufactures are in the thickly-peopled parishes of Bisley, Hampton, Stroud, Painswick, Woodchester, Horsley, Stonehouse, Stanley, Uley, Dursley, and Wotton-under-Edge. Almost the whole process is now performed by machinery except the weaving. The dyers in this district are celebrated for their scarlet, but more especially for their dark-blue colours, the excellence of which is attributed to some peculiar properties in the Stroud water. The greater part of the cloths of this county are dyed in the piece, not in the wool. Those of the superior quality, made from Merino wool, are destined either for the consumption of the kingdom or for the supply of Russia; and some few are exported to America. The inferior kinds, made of the wool of the Cotswold, the Hereford, or the Southdown sheep, are mostly calculated for the markets of India and China. These are sent to London white, and the agents of the East India Company select such as suit their demand, which are dyed to the requisite colours, and pressed and packed by their own different tradesmen in the vicinity of the metropolis. Cassimeres of the best quality are also made in this district to a very considerable extent.

In the city of Gloucester and its vicinity there are several considerable manufactories of pins, which, minute as is the article, furnish employment to upwards of fifteen hundred persons. A bell foundery was established there in 1500, which has been continued to the present time, and is a kind of hereditary occupation in a family of the name of Rudhall, who have carried it on for the last hundred and fifty years, and during that period have cast several thousands of bells for different churches.

The vicinity of Bristol is crowded with manufactories of various kinds. The sugar refinery is very considerable, and produces some of the best kinds of white sugar. Glass of all kinds, for windows and for domestic purposes, is made there. The copper and brass manufactures are also large establishments. Hard white soap is an article of considerable importance; much is sent to London, and a large quantity is exported to America and the West Indies. Hats, leather, saddlery, shoes, white lead, gunpowder, earthen ware, salt, snuff, and beer, are made in the city or neighbourhood of Bristol, and form the rudiments of its foreign trade, as well as administer to its domestic intercourse with the western counties, and with Wales.

The agriculture of Gloucestershire partakes of very different characters, according to the elevation of the land. On the eastern side of the county, a district of 200,000 acres, extending over the Cotswold Hills, is provincially distinguished by the name of *stone brash land*. This tract of country is very undulating, but none of the summits rise to a great height, so that the whole is cultivated. In the intervals between the ridges of hills there are genelly beautiful rivulets, by which the inhabitants are nabled so to irrigate their meadows as to produce early rass for their young lambs. The hills, whatever be the urface, have uniformly a calcareous basis, which admi- bly adapts them for the growth of sainfoin. In no part England is that valuable grass cultivated to so great an xtent, or with such bountiful results. It has been an ar- cle of very ancient cultivation, and in this soil has the operty of producing hay for twenty successive years. requires, however, great care in the first laying down, d that all other grasses, as well as weeds, be eradicated; ter which, as it draws its nourishment from a great depth, has little or no tendency to exhaust the soil on the sur- ce. In process of time it becomes choked by other asses, when the land is again returned to the arable state. is the practice of the best farmers to have one seventh rt of their land constantly bearing sainfoin. The re- aining six portions of the farm are divided pretty near- in equal proportions between turnips, barley, clover rye-grass, wheat, peas, and oats. The principal de- ndence for producing fertility is the large flocks of eep which are bred here, and which are usually folded a dressing for the turnips. It is a common practice to re the soil, and burn it, that the weeds may be destroyed, d that the ashes may furnish manure. The crops of bar- y are moderately good. Wheat is sown at very early riods, sometimes in August, but it seldom produces even moderate crop if sowed later than September or early October. The average produce of that grain does not ceed sixteen bushels to the acre, and it is not of the st quality. The soil is more congenial to the produc- on of peas than to any other crop, and hence they form important article of cultivation. The sheep of this strict, for whose food, as the enumeration of the crops ows, the principal provision is made, are of a peculiar eed, without horns, the wool rather long, and not of a ry fine quality. They are said to be indigenous to these lls, but have of late been improved by crossing with her races. The Southdown sheep have recently been ed here, and are gradually acquiring a preference, as ey do wherever they are introduced on soils of an infe- or quality. Few parts of England have been more im- oved in cultivation within the last forty years than the otswold Hills. They have, however, in spite of this im- ovement, but a cold and barren appearance, owing to eir being nearly destitute of trees, and to the want of rdant hedges; for the fences are almost uniformly stone alls, about four feet and a half in height. The farms are nerally large, from three hundred to twelve hundred res; and the homesteads, as well as the cottages of the bourers, being usually situated in the valleys, and there- re not in sight at a distance, the face of the country s a poor and depopulated aspect. The depth of the il is scarcely more than five inches: sometimes, how- er, it is very tenacious, but the experience of the natives s taught them, that even the most clayey soils do not quire frequent ploughings. At each ploughing, consi- rable quantities of stone-rubble are brought to the sur- ce.

To the westward of the Cotswold Hills, and inclining the northwards, the rich vales of Evesham, Gloucester, d Berkley, are spread. The agricultural system which practised, though it has some variations, is generally milar. The vale of Evesham, a considerable part of hich is in Worcestershire, is watered by the river Avon, d is highly productive in corn, pasture, and fruits. On e arable lands, the most general rotation is a clean fal- w; then barley or oats; next beans or clover; and, lastly, heat. The wheat is generally sown in November or ecember, the produce is commonly abundant, and the ain is of the best quality. The district is well wooded. The hedge-rows are filled with elm, oak, ash, and maple trees, and the apple and pear trees are abundantly scattered in the fields, as well as in large orchards near the villages. Cider and perry form very valuable portions of the produce of each farm. The proportion of arable land is small; the rich pastures feed numerous cows; and butter and cheese are the articles on which many farmers almost wholly depend.

The vale of Gloucester is in the form of an arc, of which the river Severn may be said to form the chord. It is protected from the cold northerly and easterly winds by the Cotswold and Stroud Hills, and hence is well adapted for the growth of fruit trees. Though there are now no vineyards, William of Malmesbury, in the twelfth century, said that "no county in England has more numerous or richer vineyards; or which yields grapes more abundantly or of better flavour, as the wine is but little inferior to that of France in sweetness." The apple and pear trees of the district yield, however, most profusely, liquors which, in the estimation of the inhabitants, are far preferable to any wine from foreign countries. The soil of this vale is generally of a rich sandy loam, on a very retentive and tenacious subsoil of clay. Fallowing is deemed indispensable on all the arable lands, which are thrown in very high ridges, about eight yards in breadth, with furrows between them, from twenty-four to thirty inches deep. Barley, oats, clover, beans, and wheat yield most abundant crops, and of the best quality. The greater part of the land is, however, in permanent pasture, receiving no other manure than the fæces of the cattle that are grazed on it, and, in some instances, the rich sediment deposited by occasional inundations. The meadows feed numberless cows, and the dairies, besides the cheese, the name of which is derived from this county, furnish large quantities of butter, fatten many calves, and, with the whey and buttermilk, rear and fatten great numbers of swine. The swine are of a peculiarly large breed, and the market for them at Gloucester is by far the most considerable in the kingdom. The fattening of them does not, however, wholly depend on the dairy, but large quantities of oil-cake are applied to that purpose. The cheese denominated Gloucester has long enjoyed great celebrity both at home and abroad. It is usually made in the summer months, from May to October inclusive. The number of cows belonging to individuals seldom exceeds from thirty to forty. The uniformity of the quality is such that the factors, who are the middlemen, contract for the whole produce of the dairies without examining it, knowing the value of the cheese from the quality of the land on which the cows are pastured.

The vale of Berkley is separated from that of Gloucester by a natural intersection, and, like it, is bounded to the westward by the river Severn. Its surface is more irregular, but though the undulations are numerous, they are not excessive. The hills are covered with beech trees, and the face of the district is both rich and picturesque. The soil is uniformly fertile in a very extraordinary degree. Nearly the whole is rich pasture or orchard, and the arable land does not form one seventh part of the valley. The soil is a rich fat loam, occasionally mixed with a prolific clay, and generally resting on a retentive subsoil. The dairy farms are of smaller extent than in the adjoining vale, but they far excel them in the proportional quantity of the cheese which they yield, and the quality is also much superior. The cheese commonly denominated *double Gloucester* is almost wholly made in the vale of Berkley, and in the neighbourhood is known by that name. It is usually made in the months of May, June, and July in dairies, where, later in the summer, a thinner kind is manufactured. Its excellence depends upon attention to its management, as well as on the quality of the land on which the cattle are fed. The quantity of cheese made in this vale is about 1200 tons annually, and each cow is estimated to yield 350 pounds.

The western side of the Severn is principally occupied by the forest of Dean. It abounds with excellent oak and beech trees, and produces abundance of cider, especially one kind called Stire-cider, which is highly valued. The forest formerly contained 43,000 acres, but has been diminished by several royal grants; it is, however, now a most important district, on account of the large ship-timber which it produces. It abounds with coal and with iron ore, and the miners are regulated by peculiar courts.

The most remarkable curiosities of this county are the Roman antiquities at Woodchester, which have been accurately described by that indefatigable antiquary Lysons; the Roman roads, which traverse it in various directions; the numerous antique coins which have been frequently found in the fields; the vestiges of ancient fortifications, and the ruins of monastic edifices.

This county has long conferred the title of duke on various members of the royal family, or in ancient times on those connected with that of the reigning prince. It gives titles also to Marquis Camden, Earl of Berkley, Earl Bathurst, Lord Sherborne, and Lord Segrave. For election purposes it is formed into the eastern division, the polling-places of which are Gloucester, Stroud, Tewkesbury, Cirencester, Camden, Northleach, and Cheltenham; and the western, the polling-places of which are Wotton-under-Edge, Newent, Newenham, Coleford, Sodbury, Thornbury, and Dursley.

Two members for each are returned to parliament from Bristol, Gloucester, Cirencester, and Tewkesbury; and one for each from Cheltenham and Stroud; making, with four for the county, fourteen in all. The seats of noblemen and gentlemen are very numerous, but the most remarkable of these are Badminton, the Duke of Beaufort's; Berkley Castle, Lord Segrave's; Oakley Grove, Lord Bathurst's; Sherborne, Lord Sherborne; Tolworth, Lord Ducie; King's Weston, Lord de Clifford; Hengham Court, Sir William Guise's; Fairford, Mr Raymond Barker; Whitcombe Park, Sir William Hicks; Gatcombe Park, Mr Ricardo; and Blaze Castle, Mr Harford's.

GLOVE, a covering for the hand and wrist. To throw the glove was a practice or ceremony very usual amongst our forefathers, being the challenge by which one man defied another to single combat. It is still retained at the coronation of our kings, when the king's champion casts his glove in Westminster hall, and thus challenges all men to dispute the royal title.

Favyn supposes the custom to have arisen amongst the eastern nations, who in all their sales and deliveries of lands, goods, and the like, used to give the purchaser their glove by way of delivery or investiture. To this effect he quotes Ruth (iv. 7), in which the Chaldee paraphrase has *glove* where the common version renders the Hebrew word by *shoe*. He adds, that the Rabbin interpret by *glove* that passage in the 108th Psalm, *In Idumeam extendam calceamentum meum*, Over Edom will I cast out my shoe. Accordingly, amongst us, he who took up the glove, thereby declared his acceptance of the challenge, and as a part of the ceremony, took the glove off his own right hand, and cast it upon the ground, that it might be taken up by the challenger. This had the force of a mutual engagement to meet at the time and place which might be appointed by the king, the parliament, or the judges.

Gloves are now a common article of dress. They are most commonly made of leather; but there are others made of silk, thread, cotton, or worsted. Leather gloves are made of the skins of the chamois, kid, lamb, beaver, doe, elk, and other animals. The leather of gloves is not, properly speaking, tanned, but cured with alum, by which it is rendered soft and pliable. Some sorts of leather gloves admit of being washed, others do not. Woodstock and Worcester, but particularly the former, are famed for the manufacture of leather gloves of a superior quality. The produce of the Worcester manufacture has been estimated at about 42,000 dozen pairs of oil-leather or beaver gloves, and 470,000 dozen pairs of kid and lamb-skin gloves, the value of the whole being about L.375,000. There are other places in England celebrated for their manufacture of gloves; and Dundee, in Scotland, has long been famed for the production of this article. Machinery is occasionally employed in sewing gloves; but this process is not considered as cheaper than that accomplished by manual labour, and is only had recourse to when it is wished to have the stitches correctly equidistant. Limerick used to be famous for the manufacture of a kind of ladies' gloves, called chicken gloves. Great quantities of cotton gloves are made at Nottingham and Leicester. Until the year 1825 the importation of leather gloves and mitts was prohibited; but at that period a duty was laid upon them, and they are now allowed to enter. The total quantity of these articles imported in the year 1832 was 126,386 dozen pairs, and the total receipt of duty on them L.27,106. The number of lamb and kid skins entered for home consumption in the year ending 1831 was 3,901,241, and the number of dozen pairs of gloves produced in the same year 585,180.

Gloves were used for certain purposes at a very early period. It is believed that the Persians used them, and they were employed by the Greeks and Romans in certain kinds of labour. During the middle ages gloves were worn by certain functionaries as a mark of dignity, but as civilization advanced they gradually became common to all classes of the community.

GLOVER, Richard, was the son of Richard Glover, a Hamburg merchant in London, and was born in St Martin's Lane in the year 1712. He very early evinced a strong propensity for poetry, and whilst at school wrote, amongst other pieces, a poem to the memory of Sir Isaac Newton, which is prefixed to the view of that incomparable author's philosophy, published by his intimate friend Dr Pemberton, 1728, in 4to. But though possessed of talents which were calculated to obtain distinction in the literary world, he was content to devote his attention to commerce, and at a proper period commenced Hamburg merchant. He still, however, cultivated literature, and associated with those who were eminent in science. One of his earliest friends was Matthew Green, the author of some poems, which after his death were collected and published by Mr Glover in 1737. In that year Mr Glover married Miss Nunn, with whom he received a handsome fortune; and in the same month published *Leonidas*, a poem in quarto, which in two years passed through three editions. This poem was inscribed to Lord Cobham, and upon its first appearance was received by the world with great approbation, though it has since been unaccountably neglected. Lord Lyttleton, in a popular publication called *Common Sense*, and in a poem addressed to the author, praised it in the warmest terms; and in 1738 Dr Pemberton published observations on poetry, especially epic, occasioned by the poem of Leonidas, merely with a view to point out its beauties. In 1739 Mr Glover published *London, or the Progress of Commerce*, quarto; and a ballad entitled *Hosier's Ghost*. Both these pieces seem to have been written with a view to incite the public to resent the misconduct of the Spaniards; and the latter had a very considerable effect. At this period political dissensions raged with great violence, more especially in the metropolis; and at different meetings of the livery on these occasions, Mr Glover was always called to the chair, and acquitted himself in a very able manner, his conduct being patriotic and his speeches masterly. In the year 1744 the Duchess of Marlborough died, and by her will left to Mr Glover and Mr Mallet L.500 each, to write the history of the Duke of Marlborough's life. This bequest, however, never took effect. It is supposed that Glover early renounced his share of it; and Mallet, though he continued to talk of performing the task almost as long as he lived, is now known never to have made the least progress in the work. About this period Mr Glover withdrew a good deal from public notice, and lived in retirement. He had been unsuccessful in business, and with a laudable delicacy had preferred an obscure retreat to popular observation, until his affairs should be placed on a better footing. He had been honoured with the attention of Frederick prince of Wales, who once presented him with a complete set of the classics, elegantly bound, and, on his absenting himself for some time on account of the embarrassment in his circumstances, sent him, it is said, L.500. The prince died in March 1751; and in the May following Mr Glover was once more drawn from his retreat by the importunity of his friends, and stood as candidate for the office of chamberlain of London. But it unfortunately happened that he did not declare himself until most of the livery had engaged their votes, and hence he lost his election. In 1753 Mr Glover produced at Drury Lane his tragedy of *Boadicea*, which was acted nine nights, in the month of December. It had the advantage of the performance of Garrick, Mossop, Mrs Cibber, and Mrs Pritchard. From the prologue it seems to have been patronised by the author's friends in the city; and Dr Pemberton wrote a pamphlet to recommend it. In 1761 Mr Glover published *Medea*, a tragedy written on the Greek model; but it was not acted until 1767, when it appeared for the first time on the stage at Drury Lane for Mrs Yates' benefit. On the accession of George III. he appears to have surmounted the difficulties of his situation. In the parliament which was then called, he was chosen member for Weymouth, and continued to sit as such until its dissolution. In 1770 a new edition of the poem of *Leonidas* being required, it was republished in two volumes duodecimo, corrected throughout, and extended from nine books to twelve. It had also several new characters added, and the old ones were placed in new situations. The improvements made in it were very considerable; but public curiosity was not at this period sufficiently alive to recompense the pains bestowed on this once popular performance. The calamities arising from the wound given to public credit in June 1772, by the failure of the bank of Douglas, Heron, and Company, in Scotland, occasioned Mr Glover's taking an active part in settling these complicated concerns, and also in endeavouring to relieve the distress then so universally felt. In February 1744 he called the annuitants of that banking house together, at the King's Arms Tavern, and laid proposals before them for the security of their demands, with which they were fully satisfied. He also undertook to manage the interests of the merchants and traders of London concerned in the trade to Germany and Holland, and of the dealers in foreign linens, in their application to parliament in May 1774. The speeches which he made on both these occasions were published in a pamphlet. In the succeeding year he was engaged in behalf of the West India merchants in their application to parliament, and examined the witnesses and summed up the evidence in the same masterly manner as he had done on former occasions. For the assistance he afforded the merchants in this business, he was complimented by them with a service of plate, of the value of L.300; and the speech which he delivered in the house was also printed. This, we believe, was the last opportunity he had of displaying in public his oratorical talents. Having now arrived at a period of life which demanded a retreat from business, Mr Glover withdrew to ease and independence, and spent the remainder of his days with dignity and honour. It is probable that he still continued his attention to poetry, as it appears that, besides an epic poem of considerable length, he left some tragedies and comedies behind him in manuscript. After experiencing the infirmities of age, he died on the 25th of November 1785, leaving behind him a most estimable character as a man, a citizen, and a writer.

Gluck.

GLUCK, Chevalier Christopher, an eminent musical composer, was born in the Upper Palatinate, on the frontiers of Bohemia, in 1714. He commenced his studies at Prague, and at a very early period of life distinguished himself by the proficiency he had acquired upon several musical instruments, particularly the violoncello. In Italy, whither he went in the service of a nobleman, he received instructions from Martini, and produced his first opera at Milan. He came to England in the year 1745. The rebellion having then just broke out, foreigners were regarded with jealousy, and the opera was on that account closed; but through the exertions of Lord Middlesex it was reopened with a temporary political performance, called *La Caduta de' Giganti*, the music of which Gluck was employed to compose. He afterwards brought out his *Piramo e Tisbe*, which was little else than an assemblage of favourite airs from his previous works. The cold reception this opera met with first convinced him that music, to be effective, must be strictly adapted to the spirit and character of the poetical subject. This consideration induced Gluck to lay down certain general principles, which are said to have influenced all his subsequent labours in composition. These were, first, to impart to music all the force and expression it is capable of producing, and which was best attained by uniting it to the simple but animated poetry, full of natural and well-defined ideas; secondly, to make the air follow the rhythm and accents of the words, and construct the accompaniments so as to invigorate the sentiment, or contrast them with it. The system he adopted may be described as one entirely subservient to the effect of dramatic performance, where the music is never estranged from the scene and situations of the characters, and where the interest results from the perfect interfusion of sound with sense.

His unsuccessful attempts in England at length induced Gluck again to visit Italy, where he found leisure to cultivate his taste both in music and poetry. In pursuance of his new design, he studied the classical Italian poets, and derived from their writings more enlarged ideas as to the effects which might be elicited by the union of poetry with music. His darling object now was to connect himself, and act in conjunction, with some man of true poetic genius; and Gluck was so fortunate as to find such a co-operator in the person of Calzabigi, who undertook to write dramas exactly to his taste. In the following extract from the dedication of *Alceste*, Gluck assigned his reasons for deviating from the beaten track; and describes his ideas on operatic composition with much force and perspicuity. "When I undertook to set this poem, it was my design to divest the music entirely of all those abuses with which the vanity of singers, or the too great complacency of composers, has so long disfigured the Italian opera, and rendered the most beautiful and magnificent of all public exhibitions the most tiresome and ridiculous. It was my intention to confine music to its true dramatic province, of assisting poetical expression, and of augmenting the interest of the fable, without interrupting the action, or chilling it with useless and superfluous ornaments; for the office of music, when joined to poetry, seemed to me to resemble that of colouring in a correct and well-disposed design, where the lights and shades only seem to animate the figures, without altering the outline. I determined, therefore, not to stop an actor in the heat of a spirited dialogue, for a tedious *ritoruel*, nor to impede the progress of passion, by lengthen-

Gluck.

ing a single syllable of a favourite word, merely to display agility of throat; and I was equally inflexible in my resolution not to employ the orchestra to so poor a purpose as that of giving time for the recovery of breath, sufficient for a long and unmeaning cadence. I never thought it necessary to hurry through the second part of a song, though the most impassioned and important, in order to repeat the words of the first part regularly four times, merely to finish the air where the sense is unfinished, and to give an opportunity to the singer of showing that he has the impertinent power of varying passages, and disguising them, till they shall be no longer known to the composer himself. In short, I tried to banish all those vices of the musical drama, against which good sense and reason have in vain so long exclaimed. I imagined, that the overture ought to prepare the audience for the action of the piece, and serve as a kind of argument to it; that the instrumental accompaniment should be regulated by the interest of the drama, and not leave a void in the dialogue between the air and recitative; that they should neither break into the sense and connection of a period, nor wantonly interrupt the energy or heat of the action. And, lastly, it was my opinion, that my first and chief care, as a dramatic composer, was to aim at a noble simplicity; and I have accordingly shunned all parade of unnatural difficulty in favour of clearness, nor have I sought or studied novelty, if it did not arise naturally from the situation of the character and poetical expression; and there is no rule of composition which I have not thought it my duty to sacrifice, in order to favour passion and produce effects."

The opera of *Orfeo* was the first attempt of Gluck in the new course he had shaped out for himself. It was produced at Vienna, and at first excited astonishment, which however soon gave way to delight; and the opera was performed in all the principal cities of Italy with rapturous applause. The Italians were transported with a style at once so novel and chaste, so masculine and energetic. When the *Orfeo* afterwards came to be translated into French, Rousseau was so much charmed with it that he did not miss a single representation; and it is in allusion to this circumstance that he says, "If so much exalted pleasure can be enjoyed in the space of two hours, it serves to convince us that life is really good for something."

In the year 1774 Gluck came to Paris, and after studying with great assiduity and careful examination the characteristics of the French language, he composed his famous operas of *Iphigénie en Aulide* and *Alceste*, which were received with a degree of enthusiasm unparalleled in the annals of music. By these successes Gluck came to be regarded as the national musician of France. The congeniality of his style with the standard favourites Lulli and Rameau called forth general admiration. "The almost universal cry at Paris," says Burney, "was now that he had recovered the dramatic music of the ancient Greeks; that there was no other worth hearing; that he was the only musician in Europe who knew how to express the passions. These and other encomiums preparatory to his apotheosis, were uttered and published in the journals and newspapers of Paris, accompanied with constant and contemptuous censures of Italian music, when Piccini arrived. This admirable composer, the delight and pride of Naples, as Gluck was of Vienna, had no sooner erected his standard in France, than all the friends of Italian music, of Rousseau's doctrines, and of the plan, if not the language, of Metastasio's dramas, enlisted in his service. A furious war broke out; all Paris was on the *qui vive*. No door was opened to a visitor, without this question being asked, previously to his admission, "Monsieur, estes vous Picciniste ou Gluckiste?" But these disputes were obviously futile as regarded the merits of Gluck and Piccini; for the genius and particular styles of these great composers were so essentially different, that to praise the one was by no means to detract from the powers of the other.

Gluck composed in 1774 his opera of *Armide*, which was followed by *Iphigénie en Tauride*, and some others; and after having completely revolutionized the music of France, he returned to Vienna, where he remained until his death in the year 1787.

Gluck has been well called the Michel Angelo of music. He was the originator of a school which has opened up great and various sources of enjoyment to taste, and mightily influenced the character of the whole art. His genius was of the highest order. His invention was unequalled, particularly in dramatic painting and theatrical effect. Some critics complain that he is defective in song; but an intimate acquaintance with his works disproves the assertion; and we have the emphatic declaration of Rousseau, "que le chant lui sortait par les pores." It is true that we cannot perhaps cull from his compositions such melodious flowers as luxuriate in the *chef-d'œuvres* of Cimarosa, Mozart, and Rossini, and which gratify the sense frequently as much when detached, as when blended in their original wreath. The melodies of Gluck will not, with a few exceptions, stand the test of such a partition. They are essentially musical phrases which belong to a great and expanded work of imagination. They are the links of a chain, the component elements of a comprehensive design, which must be judged of relatively, and with reference to combination.

Thus it is that, when we criticise Gluck, we should not examine his operas in detail. We must consider them as we would a noble edifice, in the aggregate of its beauty. The same spirit that actuates us in reading the epics of Virgil and Tasso should exercise its dominion when we listen to the music of Gluck. His aim was rather to satisfy the mind than to flatter the ear; his music appears only to impart energy or softness to the declamation, as the different situations of the several characters require; and such is the effect of his operas when properly performed, that many persons who hear them become so deeply interested, that they cannot for an instant withhold their eyes from the stage, and are kept in perpetual anxiety till the *denouement* of the drama; so fervently does he appeal to the sympathies of mankind, and gratify the sweetest yearnings of our nature.

Whilst we admire the perfect symmetry and almost indefinable beauty of the operas of Gluck, we are equally charmed with the amazing fertility of his inventive powers. His airs are invariably original; he never copies himself. If his melodies do not always catch the ear, it is because we do not take them in connection with the passion or sentiment they are meant to express. Tried by that test, we find them exquisitely appropriate. In recitative Gluck is universally allowed to be greatest among the great. In this department he is still the model which the best masters copy, and nothing can surpass his movements for sublimity, boldness, and sustained beauty. The chorusses in his operas are full of animation and imposing effect. His judicious employment of orchestral accompaniments, and the striking effects which he thereby produced, was a new feature in music; and much as this has since been studied, nothing can better assure us of his superlative genius, than the fact, that up to this day, he stands highest in that essential branch of operatic composition, which indeed it may almost be said he created.

Whatever may be the opinion of some persons in regard to the general effect of the music of Gluck, all are agreed in assigning to him the palm of superiority in his treatment of classical subjects, and depicting scenes of deep and overpowering grief. "He is," says an anonymous author, "the only master capable of grappling with a classical subject; he could give us, better than any,

> Ariadne passioning for Theseus' injury
> And unjust flight.

[illegible] lovers, tyrannically separated for ever, have the despair of his." "It is," says a writer in the *Harmonicon*, "in scenes of great distress, in which the human heart is rent by complicated misery, or in situations where it is torn by the tempestuous fury of unbridled passions, that Gluck, transported beyond the bounds of ordinary genius, shows such energy and colouring of passion, as to become at once poet, painter, and musician. It may be that his expression of passion is sometimes too strong for common hearers; but

> Il échappe souvent des sons à la douleur,
> Qui sont faux pour l'oreille, mais sont vrais pour le cœur."

The operas of Gluck, much to the discredit of modern taste, are seldom heard in France or England; but in Germany they are frequently performed; and in Berlin, when any of his great operas are given, the theatres are crowded to excess. The Germans indeed regard Gluck as the greatest of all dramatic composers. The style of his airs is studied, and great attention bestowed on their effect; and there is a warmth and an intensity displayed by the performers in taking the recitative, and an energy in their action, which nothing but such music as Gluck's could inspire.

Gluck is described as having been of a frank and open character, although his temper was hasty and choleric. He was very rigid in exacting from performers the utmost purity and correctness of execution. (z. z.)

GLUCKSTADT, a city, the capital of the duchy of Holstein, belonging to the German dominions of Denmark. It is strongly fortified on the north bank of the Elbe, where that river is joined by the Little Rhine. It is in a marshy but fertile district, and contains 558 houses, with 5[illegible]00 inhabitants. The harbour is good, and from it several vessels are annually equipped for the Greenland whale fishery. Long. 9. 21. E. Lat. 53. 47. N.

GLUE, an inspissated jelly, of a tenacious nature, employed by artificers as a cement. It is made from various substances, according to the uses to which it is to be applied, but most commonly by boiling the parings of hides and other offals in water, and then straining the viscid matter through a wicker basket, and suffering the impurities to subside, after which process it is again boiled. Common glue is made of the skins of animals, such as oxen, cows, sheep, and the like. The parings are first digested in lime water, to remove grease and dirt from them; they are then steeped in water, and stirred from time to time; lastly, they are piled in a heap to allow of the water being pressed out, and then put into the boiler. The water is generally kept near to a boiling heat, without being suffered to enter into ebullition. When sufficiently thick, the glue is poured into flat frames or moulds; and when congealed it is cut up into square pieces, and afterwards dried in a coarse net. Glue improves by age, and that is considered as the best which, if steeped in water three or four days, swells without melting, and resumes its former dimensions after being dried. A transparent and beautiful glue is made of the shreds and parings of vellum, parchment, or white leather.

GLUTTONY, a voracity of appetite, or a propensity to gormandising.

One of our Danish kings, named Hardyknute, was so great a glutton, that a historian calls him *Bocca de Porco*, Swine's Mouth. His tables were covered four times a day with the most costly viands which the air, the sea, or the land could furnish; and as he lived, so he died; for he fell down dead whilst revelling and carousing at a wedding banquet at Lambeth. His death was so welcome to his subjects that they celebrated the day with sports and pastimes, calling it *Hock-tide*, which signifies scorn and contempt. With this king ended the reign of the Danes in England.

Gmelin.

GMELIN, JOHN GEORGE, public lecturer on botany and physic at Tubingen, member of the Royal Society of Göttingen, and also of the Academy of Sciences at Stockholm, was born on the 12th of August 1709, at Tubingen, where his father was an apothecary. Such was his diligence whilst at school, that he was qualified to attend the academical lectures at the age of fourteen, and was created doctor of medicine when only nineteen. About this time he paid a visit to the metropolis of the Russian empire, that he might have the pleasure of seeing some of his former teachers; and there he became acquainted with Blumentrost, director of the academy, who introduced him to the meetings of the members, and procured for him a pension. At Petersburg he was so much esteemed, that when he intimated a wish, in 1729, to return to Tubingen, he was honoured with a place amongst the regular members of the academy, and chosen professor of chemistry and natural history in the year 1731. In order to carry into execution a plan which had been formed by Peter the Great, for exploring a passage to China and Japan along the coast of the Russian empire, Gmelin was selected, along with two others, as properly qualified for that undertaking, which had also for its object to ascertain the boundaries of Siberia. The department of natural history was assigned to him; and he had with him and his companions, six students, two draftsmen, two hunters, two miners, four land-surveyors, and twelve soldiers, with a sergeant and drummer. They began their journey on the 19th of August 1733; and in 1736 Steller and a painter joined their society, to assist Gmelin in his arduous labours. By exploring Kamtschatka, they hoped to accomplish their mission in a satisfactory manner, for which purpose Steller proceeded to this place, whilst the rest of the party continued their travels through Siberia. In February 1743 Gmelin returned to Petersburg in safety, after a dangerous journey which lasted nine years and a half, but proved of the utmost importance to various branches of science. He resumed the offices which he had filled before; and having paid a visit, in 1747, to his native country, he was chosen professor, whilst absent, in the room of Bachmeister. But in May 1755, he was seized with a violent fever, which put a period to his valuable life, in the forty-fifth year of his age. He was undoubtedly one of the most eminent botanists of the eighteenth century, and has rendered his name immortal by his *Flora Sibirica, seu historia plantarum Siberiæ*, in four parts, large quarto. He determined the boundaries between Europe and Asia, which every geographer has adopted since his day. Through all his works the traces of great modesty, a sacred regard to truth, and the most extensive knowledge of nature, are remarkably conspicuous.

GMELIN, *Samuel Theophilus*, was born at Tubingen on the 23d of June 1745. After having taken the degree of doctor in medicine at the age of nineteen, he went to finish his studies at Leyden, where a conformity of tastes for natural history united him with Pallas. Finding himself involved in difficulties, he entertained the idea of embarking as surgeon on board of a vessel bound for the East Indies; but in the mean time, whilst waiting for assistance from his family, he established himself in the little town of Brill. The vicinity of the sea, and some excursions which he made by water in the neighbourhood, afforded him an opportunity of collecting many marine plants, and examining with attention the sea-weeds, and suggested to him the idea of writing their history. He next visited Belgium, and then proceeded to Paris, where he was well received by Adanson, who inspired him with something of his own aversion to the system of Linnæus. After a short stay in his native country, he was, in 1766, called to St Petersburg, there to profess botany. Catherine II., faithful to the plan executed by several of her predecessors, of causing learned men to travel in different parts of the Russian empire, ordered a new expedition of the same description to be undertaken. Gmelin obtained permission to join this expedition; and after having had the honour of being presented to the empress, he set out in the month of June 1768, visited the Valdaï Mountains, passed the winter at Woronetz, and descended the Don as far as Tscherkask. Here the frightful picture which was drawn of the journey by the steppes, and along the frontier to the mouth of the Terek in the Caspian Sea, induced him to renounce his first project; and he returned by the ordinary route, as far as Zaritzin, in order to proceed to Astrakan by the Volga. In the years 1770 and 1771 he visited different harbours of the Caspian, and examined with peculiar attention those parts of the Persian provinces bordering upon that sea, of which he has given a circumstantial account in his travels. Actuated by a zeal for extending his observations, he attempted to pass through the western provinces of Persia, which are in a state of perpetual disturbance, and infested by numerous banditti. In this expedition he, in April 1772, quitted Enzelli, a small trading place in Ghilan, upon the southern shore of the Caspian; but, on account of many difficulties and dangers, did not, until the 2d of December 1773, reach Sallian, a town situated at the mouth of the river Koor. He thence proceeded to Baku and Kuba, in the province of Shirvan, where he met with a friendly reception from Ali Feth Khan, the sovereign of that district. But after he had been joined by twenty Uralian Cossacks, and when he was only four days journey from the Russian fortress of Kislar, on the Terek, he and his companions were, on the 5th of February 1774, arrested by order of Usméi Khan, a petty Tartar prince, through whose territories he was obliged to pass. Usméi urged as a pretence for this arrest, that thirty years before several families had escaped from his dominions, and had found an asylum in the Russian territories; adding, that Gmelin should not be released until these families were restored. The professor was removed from prison to prison; and at length, wearied out with continued persecutions, he expired, on the 27th of June, at Achmet-Kent, a village of the Caucasus. His death was occasioned partly by vexation for the loss of several papers and collections, and partly by disorders contracted from the fatigues of his long journey. Some of his papers had been sent to Kislar during his imprisonment, and the others were not without great difficulty rescued from the hands of the barbarian who had detained him in captivity. The arrangement of these papers, which form the fourth volume of his travels, was at first consigned to the care of Guldenstaedt, but upon his death was transferred to the learned Pallas. The works of Gmelin are, 1. Historia Fucorum iconibus illustrata, St Petersburg, 1768, in 4to; 2. Voyages dans différentes parties de l'Empire de Russie, pour faire des Recherches relatives à l'Histoire Naturelle, St Petersburg, 1770, 1774, 1784, in four vols. 4to; 3. Several Memoirs in the Collections of the Society of Haerlem, and of the Academy of St Petersburg. Gmelin was also editor of volumes iii. and iv. of the *Hora Sibirica* of his uncle.

GMUND, a bailiwick of the kingdom of Wurtemberg, in the circle of Jaxt, extending over 121 square miles, and comprehending two cities, one market-town, and 131 villages, with 22,640 inhabitants. It is a mountainous and woody district, not yielding corn equal to the demand. The capital is a city of the same name, situated on the river Rems. It contains 806 houses, and 5875 inhabitants, who are employed in making cloths, hosiery, and other clothing, and many of them in the trade of silversmiths and jewellers. Long. 10. 0. 4. E. Lat. 48. 48. 15. N.

GNESEN, a circle of the Prussian province of Bromberg, formerly a part of Poland. It extends over 441 square miles, contains eight cities and towns, and 283 villages, with 31,200 inhabitants. The capital is the city of the same name, which stands on a lake between two hills. It contains a cathedral and twelve Catholic churches, two convents, and a nunnery. It is the see of an archbishop, once the primate of Poland. The town is fortified, and contains 4500 inhabitants, who carry on brewing, distilling, tanning, and making linens, and have two large fairs annually. Long. 17. 31. 25. E. Lat. 52. 25. 30. N.

GNOMES, Gnomi, certain imaginary beings, who, according to the cabalists, inhabit the inner parts of the earth. They are supposed to be small in stature, and the guardians of quarries, mines, and other similar works.

GNOMON, in *Dialling*, the style, pin, or cock of a dial, which by its shadow shows the hour of the day. The gnomon of every dial represents the axis of the earth. (See Dial and Dialling.) The word is Greek, γνωμων, which literally implies something that makes a thing known, in consequence of the style or pin indicating or making known the hour.

GNOSTICS, ancient heretics, who arose principally in the East, from the very origin of Christianity. It appears, from several passages in the sacred writings, that many persons were infected with the Gnostic heresy in the first century, though the sect did not render itself conspicuous, either for number or reputation, before the time of Hadrian, when some writers erroneously date its rise. The name is formed of the Latin *gnosticus*, and that from the Greek γνωστικος, *knowing*, a verbal derivative of γινωσκω, *I know*; and was adopted by the members of this sect, as if they were the only persons who had the true knowledge of Christianity. Accordingly, they looked upon all other Christians as simple, ignorant, and barbarous persons, who explained and interpreted the sacred writings in a too low, literal, and unedifying signification.

At first the Gnostics were only the philosophers and wits of those times, who formed for themselves a peculiar system of theology, agreeably to the philosophy of Pythagoras and of Plato, to which they accommodated all their interpretations of Scripture. But Gnostics afterwards became a general name, comprehending different sects and parties of heretics, who appeared in the first centuries, and who, though they differed amongst themselves as to circumstances, yet all agreed in some common principles. They were such as corrupted the doctrine of the gospel by a profane intermixture with its divine truths of the tenets of the oriental philosophy concerning the origin of evil and the creation of the world. Such were the Valentinians, Simonians, Carpocratians, Nicolaitans, and others.

The denomination of Gnostics was also sometimes applied more particularly to the successors of the first Nicolaitans and Carpocratians in the second century. Such as desire to become thoroughly acquainted with their doctrines, reveries, and visions, may consult Irenæus, Tertullian, Clemens Alexandrinus, Origen, and Epiphanius, particularly the first of these writers, who narrates their opinions at large, and at the same time confutes them; indeed he dwells more expressly on the Valentinians than any other sort of Gnostics; but he shows the general principles upon which all their mistaken opinions were founded, and the method they followed in explaining Scripture. He accuses them of introducing into religion certain vain and ridiculous genealogies, that is, a kind of divine processions or emanations, which had no foundation except in their own wild imaginations.

In fact, the Gnostics admitted that these æons or emanations were nowhere expressly delivered in the sacred writings; but insisted, at the same time, that Jesus Christ had intimated them in parables to such as could understand him. They built their theology not only upon the gospels and the epistles of St Paul, but also upon the law of Moses and the prophets. The writings of the latter were peculiarly serviceable to them, on account of the allegories and allusions with which they abound, and which are capable of different interpretations; but their doctrine concerning the creation of the world by one or more inferior beings of an evil or imperfect nature, led them to deny the divine authority of those books of the Old Testament which contradicted this idle fiction, and filled them with an abhorrence of the religion of Moses, who, they alleged, was actuated by the malignant author of this world, and consulted his own glory and authority, not the real advantage of men. Their persuasion that evil resided in matter, as its centre and source, made them treat the body with contempt, discourage marriage, and reject the doctrine of the resurrection of the body and its re-union with the immortal spirit. Their notion that malevolent genii presided in nature, and occasioned diseases and calamities, wars and desolations, induced them to apply themselves to the study of magic, in order to weaken the powers or to suspend the influence of their malignant agents.

The Gnostics considered Jesus Christ as the Son of God, and consequently inferior to the Father, as a being who came into the world for the rescue and happiness of miserable mortals, oppressed by matter and evil beings; but they rejected our Lord's humanity, upon the principle that every thing corporeal is essentially and intrinsically evil; and hence the greater part of them denied the reality of his sufferings. They attached great value to the beginning of the gospel of St John, where they fancied that they saw their æons, or emanations, under the Word, the Life, and the Light. They divided all nature into three kinds of beings, *hylic* or material, *psychic* or animal, and *pneumatic* or spiritual. Upon the same principle they also distinguished three sorts of men; material, animal, and spiritual. The first, who were material, and incapable of knowledge, inevitably perished, both soul and body; the third, such as the Gnostics themselves pretended to be, were all certainly saved; but the psychic, or animal, who were intermediate between the two others, were capable either of being saved or damned, according to their good or evil actions.

With regard to their moral doctrines and conduct, they were much divided. The greater part of the sect adopted austere rules of life, recommended rigorous abstinence, and prescribed severe bodily mortifications, with the view of purifying and exalting the mind. Some, however, maintained that there was no moral difference in human actions, and thus confounding right and wrong, gave a loose rein to the passions, asserting the innocence of following blindly all their impulses, and of living according to their tumultuous dictates. They supported their opinions and practice by various authorities; some referred to fictitious and apocryphal writings of Adam, Abraham, Zoroaster, Christ, and his apostles; others boasted that they had deduced their sentiments from certain doctrines of Christ which had been concealed from the vulgar; others affirmed that they had arrived at superior degrees of wisdom by an innate vigour of mind; and others asserted that they were instructed in these mysterious parts of theological science by Theudas, a disciple of St Paul, and by Matthias, one of the friends of our Lord. The tenets of the ancient Gnostics were revived in Spain in the fourth century, by a sect called the Priscillianists.

The appellation of Gnostic sometimes also occurs in a good sense, in the writings of the ancient ecclesiastical authors, particularly those of Clemens Alexandrinus, who, in the person of his Gnostic, describes the characters and qualities of a perfect Christian. This point he labours in the seventh book of his *Stromata*, where he shows that none but the Gnostic or learned person has any true religion. He affirms, that were it possible for the knowledge of God to be separated from eternal salvation, the Gnostic would make no scruple in preferring the knowledge; and that if God would promise him impunity for doing any thing he had once spoken against, or offer him heaven on those terms, he would never alter his measures. In this sense the father uses Gnostics, in opposition to the heretics of the same name; affirming that the true Gnostic is he who has grown old in the study of the Holy Scriptures, and who preserves the orthodox doctrine of the apostles and of the church; whereas the false Gnostic abandons all the apostolical traditions, imagining himself wiser than even the apostles. But the name of Gnostic, which was originally the most glorious, became at length infamous from the idle opinions and dissolute lives of the persons who affected it.

GOA, a celebrated city of Hindustan, in the province of Bejapoor, and the capital of all the Portuguese settlements in the East Indies. It is the residence of the viceroy, and of the chief Portuguese inhabitants; the seat of the supreme court of judicature, and the see of an archbishop, who is primate of the East. It is situated on the north side of an island, is about twelve miles long and six broad, and stands at the mouth of the Mandova river. Goa consists of two distinct cities. The old one is eight miles up the river, and is now almost deserted by the secular Portuguese, on account of its being unhealthy. It contains many magnificent churches, and exhibits specimens of architecture superior to any thing attempted by Europeans in other parts of India, particularly the church and convent of St Augustin. The city is large, the streets are straight, the houses regularly and handsomely built of stone in the European style, many of them large and magnificent, though they are now no longer inhabited. The viceroy and principal inhabitants reside in the new city, which is at the mouth of the river, and within the forts. It possesses two harbours, one on each side of the island, both of which are well defended by various castles and batteries mounting heavy cannon. The towns are also fortified, but they are of too great an extent to withstand a siege. Algoada Point, which is in longitude 67. 73. 53. east, latitude 15. 29. north, forms the northern extremity of Goa Bay. It has a lighthouse and small fort on it; but the principal fort is situated close to the sea, on the south-east side of the headland, where there is a well of excellent water, from which the shipping are supplied. Nostra Senhora de la Cabo, a large monastery, of a white appearance, is situated on the summit of the bluff point of land, about two miles and a half south-east of Algoada, which forms the south side of the bay. The common anchorage is abreast of Algoada fort, the flag-staff bearing about north at half a mile distance from the shore. The bar at the entrance of the river is about two miles to the eastward of Algoada Point, having sixteen or eighteen feet on it at high-water of spring-tides. The bottom is hard and rocky; and the channel so winding and intricate, that a ship ought not to enter the river without a pilot. After the early part of May, when it is considered unsafe to remain at the anchorage in the roads, the Portuguese send their large ships, which cannot run into the river, to Marmagon roads, four or five miles to the southward of Algoada fort, where they are sheltered from the south-west monsoon by mooring close under the north-east side of that peninsula. The colonial settlement at Goa seems now to be almost abandoned by the mother country, and the inhabitants scarcely retain the national language or manners. The trade has also greatly fallen off, and the people are impoverished, so that the best families are reduced to gain a scanty subsistence by working at lace or muslin. Not more than three ships arrive from Portugal in the course of the year, and these generally proceed to the British settlements to complete their cargoes for Europe.

The trade from Goa to China is carried on by one or two ships in the year, which are called China ships. These carry to Surat, and the ports to the northward, Chinese and European goods, and returning with cotton and other articles, call at Goa to complete their cargoes for China. They commence their trade at the most southern settlement, which is Ajengo, and thence they proceed to Cochin, Calicut, Tellicherry, and Mangalore, and then to Goa; at these different places they take in pepper, cardamums, cassia, lignea, and other articles, which they resell at their northern settlements, and complete the voyage within the year. A coasting trade is carried on in small vessels with the different ports on the coast, whence they return to Goa with produce, which forms the home cargoes of their ships. With Macao and the British settlements an inconsiderable trade is carried on; the imports consisting principally of piece goods, raw silk, grain, sugar, woollens, and a few European articles, whilst the exports are piece goods, betel nut, hemp, and other articles of trifling amount.

Goa was taken from its Hindu rajahs of Bijanagur, by the Bhamenee sovereigns of the Deccan. On the arrival of the Portuguese on the Malabar coast it was an opulent place, well fortified, and subject to Zabaim, a potent prince, from whom it was taken by the Portuguese general Albuquerque. It was retaken by the native prince, after which Albuquerque, having received reinforcements, again succeeded in 1510 in making himself master of the city after a bloody assault. He improved its defences, and constituted it the capital of all his conquests; and it has ever since remained in possession of the Portuguese, who during the sixteenth century extended their conquests, and obtained possession of numerous places on the sea-coasts of India. In the course of these operations they were involved in hostilities with the Mahrattas; and advancing inland, laid siege to the town of Pondah. Here they were surrounded by a large Mahratta force, and effected their retreat with great difficulty and serious loss. Having formed an alliance with Aurungzebe, they succeeded in repulsing the Mahrattas, with whom they at length concluded a peace. In 1518 the Portuguese power in India was at its height, and from this period it began to decline. In 1580 the Portuguese possessed the following places in India, namely, Diu Damaun, Choul, Baheen, Salsette, Bombay, and Goa. They had factories at Dabul, Onore, Barcelore, Mangalore, Cananore, Calicut, Cranganore, Cochin, and Quilon. They had establishments on the coast of Ceylon, and factories in the Bay of Bengal, at Masulipatam, Negapatam, and St Thome, with commercial stations in Bengal. They possessed, besides, the city of Malacca, and factories on the coasts of the Burman empire and the province of Chittagong. They acquired possession of the Spice Islands in the Eastern Archipelago, and carried on a considerable intercourse with Japan and China. They did not acquire Macao until 1586. After the conquest of Portugal in 1580, by Philip II. of Spain, the intercourse of the colonies with the mother country was much abridged; and this eastern empire, composed of the loose materials of recent conquest, began to decay, from the vices of its internal administration, and from the power of the priests. It has now altogether declined, and forms a very inconsiderable appendage to the mother country. The travelling distance from Poonah is 245 miles, from Bombay 292, from Delhi 1158, and from Calcutta 1300 miles. Long. 73. 42. E. Lat. 15. 30. N. (Milburn, *Oriental Commerce;* Buchanan, *Travels in Mysore;* Macpherson, *History of the Trade of India;* &c.)

GOACH, the capital town of the Macassar country, in the island of Celebes. It is sometimes called the kingdom of Goach. Here the Malays, after the arrival of the Portuguese in 1512, were allowed to build a mosque, as they were not yet converted to the Christian religion. In 1778 the city was stormed by the Dutch, and the fortifications razed.

GOALPARAH, a town of Hindustan, in the province of Bengal, and district of Rangamatty, situated on the south shore of the Brahmapootra, near the frontier of Assam. Here is carried on a very considerable trade with the Assamese, who bring coarse cloths, stick-lac, gold, ivory, wax, and tar, which they exchange for salt, silks, and fine muslins. The trade would be more considerable, were it not impeded by the disorderly state of the country, and the savage manners of the chiefs, who defraud and frequently murder the traders. A detachment of native infantry is stationed here to guard the frontier, and no European is allowed to proceed beyond it without a pass from the government. It is a hundred and seventy miles north by east from Dacca. Long. 90. 32. E. Lat. 26. 8. N.

GOAND, a mountainous district of Hindustan, in the province of Gundwana, intersected by the Mahanuddy river. The inhabitants are very uncivilized, and boast of never having been subdued, though they are rendered tributary by the rajah of Nagpoor. The country is poor, and there are no good roads.

GOAT ISLAND, the southernmost of the Bashee islands, in the Eastern Seas. It is the smallest of the group, flat and level, and has a number of goats in it, from which it derives its name. Long. 120. 13. E. Lat. 13. 52. N.

GOBAN, a small island, with a town, at the mouth of the Euphrates, where it empties itself into the Persian Gulf, fifty miles east-south-east of Bassora.

GOBELIN, GILES, a celebrated French dyer, in the reign of Francis I., who, having discovered a method of dyeing a beautiful scarlet, had his name given to the finest French scarlets. His house, in the suburb of St Marcel at Paris, and the rivulet which he made use of, are still called the Gobelins. An academy for drawing, and a manufactory of fine tapestries, were erected in this quarter in 1666; for which reason the tapestries are called *Gobelin.*

GOBINGUNGE, a town of Bengal, in the district of Ghoraghaut, situated on the eastern bank of the Currattya river. It carries on a considerable trade in grain and cotton. Long. 89. 3. E. Lat. 25. 6. N.

GOBLET, or GOBELET, a kind of drinking cup, or bowl, commonly of a round figure, and without either foot or handle. The word is French, *gobelet,* which Salmasius and others derive from the barbarous Latin *cupa.* Budæus deduces it from the Greek κυπελλον, *a sort of cup.*

GOCAUK, a town of Hindustan, in the province of Bejapoor. It is a place of considerable extent and importance, situated on a hill, and watered and defended on the south side by the Gutpurba river, whilst on the other three sides it is surrounded by a brick wall and a wet ditch. Here is an extensive manufacture of cotton and silk goods. The silk is procured from Bengal by way of Goa. It was taken from the king of Bejapoor by Sultan Muazim, son of Aurungzebe, in 1685, but does not now contain any buildings or ruins of consequence. About two miles from this place is a very fine cataract, 169 yards broad, and 174 feet in perpendicular height. It is formed by the river Gutpurba, which is precipitated from the hills to the low country. Long. 75. 6. E. Lat. 16. 20. N.

GOD, one of the many names of the Supreme Being. God is also used in speaking of any false deity of the heathens. The Greeks and Latins, it is observable, did not mean by the name of god, an all-perfect being, of whose nature, eternity, infinity, omnipresence, and omnipotence, were essential attributes; amongst them, the word only implied an excellent and superior nature, and, accordingly, they gave the appellation of gods to all beings of a rank or class higher and more perfect than men, espeally to those who were inferior agents in the divine administration. Thus men themselves, according to their system, might become gods after death; inasmuch as their souls might attain to a degree of excellence superior to that which they were capable of while in life.

GODALMING, a market-town of the hundred of its own name, in the county of Surrey, on the great road to Portsmouth, thirty-four miles from London. It is very pleasantly situated in a valley, watered by the river Wye, which is navigable to the Thames, and by the latter to the metropolis. There is a corporation consisting of a warden and eight assistants, but it returns no member to parliament. There is a well-attended market on Saturdays, at which much corn, especially barley, is sold; and making it into malt is one branch of the trade carried on, and by the river much is transmitted to London. The population amounted in 1801 to 3405, in 1811 to 3543, in 1821 to 4098, and in 1831 to 4529.

GODAVERY, a large river of India, which has its rise in the Western Ghauts, seventy miles to the north-east of Bombay, and which, with a circuitous curve, flows nearly over the whole breadth of the peninsula in a south-east direction. After traversing the province of Aurungabad and the country of Tellingana from west to east, it turns to the south-eastward, and, receiving the Bain Gonga about ninety miles above the sea, besides many smaller rivers, separates into two principal channels at Rajamundry, one of which falls into the Bay of Bengal a few miles south of the town of Coringa, and the other a little below Narsipore, forming between them the island of Nagur, comprehending 500 square miles, and which, being intersected by various ramifications from these rivers, includes several tide-harbours for vessels of moderate burden, and is highly fertile and productive. Ingeram, Coringa, Yanam, Bandarmalanka, and Narsipore, are among the places situated at the mouth of this river, which appears to be the most considerable stream that rises between the Ganges and Cape Comorin. Its whole course may be estimated at nearly 800 miles, having, owing to the peculiar configuration of the Indian peninsula, which rises to its height much nearer the western than the eastern shore, nearly traversed the country from sea to sea. During the rainy season the Godavery rolls a prodigious volume of water to the ocean; in many places it is more than a mile in breadth. During the dry season its bed consists in many places of an expanse of sand, the river being divided into numerous shallow streams. Extensive forests of teak trees line the shores of the river until it emerges from the Ghaut Mountains.

GODDARD, Jonathan, an eminent physician and chemist, and one of the first promoters of the Royal Society, was born about the year 1617. He was elected a fellow of the College of Physicians in 1646, and appointed reader of the anatomical lecture in that college in 1647. As he took part against Charles I., accepted the wardenship of Merton College, Oxford, from Oliver Cromwell then chancellor, and sat as sole representative of that university in Cromwell's parliament, he was removed from his wardenship by Charles II. He was then, however, professor of physic at Gresham College, to which he retired, and continued to attend those meetings which gave birth to the Royal Society, upon the first establishment of which he was nominated one of the council. Being fully persuaded that the preparation of medicines was not less the physician's duty than prescribing them, he constantly prepared his own; and in 1668 he published a treatise recommending his example to general practice. He died of an apoplectic attack in 1674; and his memory has been preserved by the drops which bear his name, otherwise called *Guttæ Anglicanæ*, the secret of which he sold to Charles II. for L.5000.

GODDESS, a heathen deity of the female sex. It was the peculiar privilege of the goddesses to be represented naked on medals; for it was supposed that the imagination must be awed and restrained by the consideration of the divine character.

GODFATHERS and Godmothers, persons who, at the baptism of infants, answer for their future conduct, and solemnly promise that they will renounce the devil and all his works, and follow a life of piety and virtue; and by this means lay themselves under an indispensable obligation to instruct them, and watch over their conduct. This custom, which is of great antiquity in the Christian church, was probably instituted to prevent children being brought up in idolatry, in case their parents died before they arrived at years of discretion. The number of godfathers and godmothers is reduced to two in the church of Rome, and three in the church of England; but formerly there was no limit to the number.

GODFREY of Bouillon, prince of Lorraine, a celebrated crusader, and victorious commander. He was chosen general of the expedition which the Christians undertook for the recovery of the Holy Land, and sold his dukedom to prepare for the war. He took Jerusalem from the Turks in 1099; but his piety would not permit him to wear a diadem of gold in the city where his Saviour had been crowned with thorns. The sultan of Egypt afterwards sent against him a powerful army, which he defeated with terrible slaughter. Godfrey died in 1160.

GODMANCHESTER, a town of the county of Huntingdon, in the hundred of Toesland, fifty-eight miles from London. It stands in a damp situation on the river Ouse, and is said to have been once a very large city. It is now only remarkable for the excellence of its soil and agriculture. It is a corporate town, but sends no members to parliament, and is so near to Huntingdon as to need no market. The inhabitants amounted in 1801 to 1573, in 1811 to 1779, in 1821 to 1953, and in 1831 to 2146.

GODSTONE, a town of the county of Surrey, in the hundred of Tandridge, twenty miles from London. It stands at the foot of the range of chalk hills, in a healthy soil and mild climate. The inhabitants, who are chiefly occupied in agriculture, amounted in 1801 to 1081, in 1811 to 1156, in 1821 to 1210, and in 1831 to 1397.

GODWIN, Francis, son of Dr Godwin, bishop of Bath and Wells, was born at Havington, Northamptonshire, in 1561. After passing through the usual course of grammar-school instruction, he was sent to Christ Church College, Oxford, where he was elected a student in 1578, and took his degree of bachelor in 1580, and that of master of arts in 1583. About this time he wrote an amusing piece on a philosophical subject, which, as it contradicted certain received notions, he never published, but which appeared about five years after his death, under the title of the Man in the Moon, or a discourse of a Voyage thither, by Domingo Gonzalez, 1638, in 8vo. This satirical production, which displays considerable fancy and even genius, seems to have afforded to Dr Swift several hints of which he availed himself in his voyage to Laputa; and, what is still more remarkable, it shows the author to have been acquainted with the Copernican system. He also suppressed another piece, entitled *Nuncius Inanimatus*, or the Inanimate Messenger, intended to communicate various methods for conveying intelligence secretly, speedily, and safely; a production which appears to have been the prototype of Bishop Wilkins' *Mercury, or secret and swift Messenger.* It was published, however, in 1657, and afterwards translated by Dr Thomas Smith. Some time after he had taken his degree, Godwin entered into holy orders, and soon became rector of Samford-Orcais in Somersetshire, a prebendary in the church of Wilts, and canon-residentiary, also vicar of Weston-in-Zoyland in the same county. Having turned his attention to the subject of British antiquities, he became acquainted with Camden, whom he accompanied in a journey through Wales in 1590, in search of curiosities; but, although he took great pleasure in these inquiries, he at length confined himself entirely to ecclesiastical history and antiquities. He was created bachelor of divinity in 1593, and doctor in 1595, when, having resigned the vicarage of Weston, he was appointed rector of Bishop's Lidiard in the same county. In 1601 he published his Catalogue of the Bishops of England, since the first planting of the Christian religion in this island; a work in which he embodied his collections in ecclesiastical biography, and which, through the intercession of Lord Buckhurst, to whom he acted as chaplain, procured him the bishopric of Llandaff. In 1615 he published another edition, with numerous alterations and additions; but this having been very erroneously printed, owing to the author's distance from the press, he recast the whole in an elegant Latin dress, and the year after sent it abroad to be printed. This last edition was dedicated to the king, who in return conferred upon him the bishopric of Hereford, to which he was translated in 1617. The work was afterwards reprinted, in the year 1743, with a continuation by Dr Richardson, the whole being in one volume folio, with a portrait of Godwin, and other embellishments. In 1616 he published, in Latin, *Rerum Anglicarum Henrico VIII., etc. regnantibus*, which was translated and published by his son under the title of Annals of England, containing the reigns of Henry VIII., Edward VI., and Queen Mary, in folio. His last publication was a Computation of the Value of the Roman Sesterce and Attic Talent, which appeared in the year 1630. After this he fell into a languishing disorder, which put a period to his existence in April 1633. (A.)

GODWIN, or *Goodwin Sands*. See KENT.

GOELWARAH, a district of Hindustān, in the province of Gujrat, situated within the 21st and 22d parallels of north latitude, and bounded on the east by the Gulf of Cambay. The greater part of this country, adjacent to the Gulf of Cambay, was ceded by the Mahratta chief the Guicowar, in 1805, in part payment of the subsidiary force supplied for his protection. It is famous for a breed of cattle, and its chief town is Gogo.

GOEST, a city of the Westphalian Prussian province, the capital of a circle of the same name. It is in a fertile district, is surrounded with walls, and contains 6745 inhabitants, who are employed in various kinds of manufactures, but mostly on a contracted scale. It was formerly one of the Hanse towns, and enjoyed the right of coining money. Long. 8. 1. E. Lat. 51. 54. 15. N.

GOETHE, JOHN WOLFGANG VON, a man of commanding influence in the literature of modern Germany throughout the latter half of his long life, and possessing two separate claims upon our notice; one in right of his own unquestionable talents; and another much stronger, though less direct, arising out of his position, and the extravagant partisanship put forward on his behalf for the last forty years. The literary body in all countries, and for reasons which rest upon a sounder basis than that of private jealousies, have always been disposed to a republican simplicity in all that regards the assumption of rank and personal pretensions. *Valeat quantum valere potest*, is the form of license to every man's ambition, coupled with its caution: let his influence and authority be commensurate with his attested value: and, because no man in the present infinity of human speculation, and the present multiformity of human power, can hope for more than a very limited superiority, there is an end at once to all *absolute* dictatorship. The dictatorship in any case could be only *relative*, and in relation to a single department of art or knowledge; and this for a reason stronger even than that already noticed, viz. the vast extent of the field on which the intellect is now summoned to employ itself. That objection, as it applies only to the *degree* of the difficulty, might be met by a corresponding degree of mental energy; such a thing may be supposed, at least. But another difficulty there is, of a profounder character, which cannot be so easily parried: those who have reflected at all upon the fine arts, know that power of one kind is often inconsistent, positively incompatible, with power of another kind. For example, the *dramatic* mind is incompatible with the *epic*. And though we should consent to suppose that some intellect might arise endowed upon a scale of such angelic comprehensiveness as to vibrate equally and indifferently towards either pole, still it is next to impossible, in the exercise and culture of the two powers, but some bias must arise which would give that advantage to the one over the other which the right arm has over the left. But the supposition, the very case put, is baseless, and countenanced by no precedent. Yet, under this previous difficulty, and with regard to a literature convulsed, if any ever was, by an almost total anarchy, it is a fact notorious to all who take an interest in Germany and its concerns, that Goethe did in one way or other, through the length and breadth of that vast country, establish a supremacy of influence wholly unexampled; a supremacy indeed perilous in a less honourable man, to those whom he might chance to hate, and with regard to himself thus far unfortunate, that it conferred upon every work proceeding from his pen a sort of papal indulgence, an immunity from criticism, or even from the appeals of good sense, such as it is not wholesome that any man should enjoy. Yet we repeat that German literature was and is in a condition of total anarchy: with this solitary exception, no name, even in the most narrow section of knowledge or of power, has ever been able in that country to challenge unconditional reverence; whereas, with us and in France, name the science, name the art, and we will name the dominant professor; a difference which partly arises out of the fact that England and France are governed in their opinions by two or three capital cities, whilst Germany looks for its leadership to as many cities as there are *residenzen* and universities: for instance, the little territory with which Goethe was connected presented no less than two such public lights; Weimar, the *residenz* or privileged abode of the Grand Duke, and Jena, the university founded by that house. Partly, however, this difference may be due to the greater restlessness, and to the greater energy as respects mere speculation, of the German mind. But no matter whence arising, or how interpreted, the fact is what we have described: absolute confusion, the "anarch old" of Milton, is the one deity whose sceptre is there paramount; and yet *there* it was, in that very realm of chaos, that Goethe built his throne. That he must have looked with trepidation and perplexity upon his wild empire and its "dark foundations," may be supposed. The tenure was uncertain to *him* as regarded its duration; to us it is equally uncertain, and in fact mysterious, as regards its origin. Meantime the mere fact, contrasted with the general tendencies of the German literary world, is sufficient to justify a notice, somewhat circumstantial, of the man in whose favour, whether naturally by force of genius, or by accident concurring with intrigue, so unexampled a result was effected.

Goethe was born at noonday on the 28th of August 1749, in his father's house at Frankfort on the Maine. The circumstances of his birth were thus far remarkable, that, unless Goethe's vanity deceived him, they led to a happy revolution hitherto retarded by female delicacy falsely directed. From some error of the midwife who attended his mother, the infant Goethe appeared to be still born. Sons there were as yet none from this marriage; everybody was therefore interested in the child's life; and the panic which arose in consequence, having sur-ved its immediate occasion, was improved into a public resolution (for which no doubt society stood ready at that moment) to found some course of public instruction from this time forward for those who undertook professionally the critical duties of accoucheur.

We have noticed the house in which Goethe was born, as well as the city. Both were remarkable, and fitted to leave lasting impressions upon a young person of sensibility. As to the city, its antiquity is not merely venerable, but almost mysterious; towers were at that time to be found in the mouldering lines of its earliest defences, which belonged to the age of Charlemagne, or one still earlier; battlements adapted to a mode of warfare anterior even to that of feudalism or romance. The customs, usages, and local privileges of Frankfort, and the rural districts adjacent, were of a corresponding character. Festivals were annually celebrated at a short distance from the walls, which had descended from a dateless antiquity. Every thing which met the eye spoke the language of elder ages; whilst the river on which the place was seated, its great fair, which still held the rank of the greatest in Christendom, and its connection with the throne of Cæsar and his inauguration, by giving to Frankfort an interest and a public character in the eyes of all Germany, had the effect of countersigning, as it were, by state authority, the importance which she otherwise challenged to her ancestral distinctions. Fit house for such a city, and in due keeping with the general scenery, was that of Goethe's father. It had in fact been composed out of two contiguous houses; that accident had made it spacious and rambling in its plan; whilst a further irregularity had grown out of the original difference in point of level between the corresponding stories of the two houses, making it necessary to connect the rooms of the same *suite* by short flights of steps. Some of these features were no doubt removed by the recast of the house under the name of "repairs" (to evade a city bye-law), afterwards executed by his father; but such was the house of Goethe's infancy, and in all other circumstances of style and furnishing equally antique.

The spirit of society in Frankfort, without a court, a university, or a learned body of any extent, or a resident nobility in its neighbourhood, could not be expected to display any very high standard of polish. Yet, on the other hand, as an independent city, governed by its own separate laws and tribunals (that privilege of *autonomy* so dearly valued by ancient Greece) and possessing besides a resident corps of jurisprudents and of agents in various ranks for managing the interests of the German emperor and other princes, Frankfort had the means within herself of giving a liberal tone to the pursuits of her superior citizens, and of co-operating in no inconsiderable degree with the general movement of the times, political or intellectual. The memoirs of Goethe himself, and in particular the picture there given of his own family, as well as other contemporary glimpses of German domestic society in those days, are sufficient to show that much knowledge, much true cultivation of mind, much sound refinement of taste, were then distributed through the middle classes of German society; meaning by that very indeterminate expression those classes which for Frankfort composed the aristocracy, viz. all who had daily leisure, and regular funds for employing it to advantage. It is not necessary to add, because that is a fact applicable to all stages of society, that Frankfort presented many and various specimens of original talent, moving upon all directions of human speculation.

Yet, with this general allowance made for the capacities of the place, it is too evident that, for the most part, they lay inert and undeveloped. In many respects Frankfort resembled an English cathedral city, according to the standard of such places seventy years ago, not, that is to say, like Carlisle in this day, where a considerable manufacture exists, but like Chester as it is yet. The chapter of a cathedral, the resident ecclesiastics attached to the duties of so large an establishment, men always well educated, and generally having families, compose the original *nucleus*, around which soon gathers all that part of the local gentry who, for any purpose, whether of education for their children, or of social enjoyment for themselves, seek the advantages of a town. Hither resort all the timid old ladies who wish for conversation, or other forms of social amusement; hither resort the valetudinarians, male or female, by way of commanding superior medical advice at a cost not absolutely ruinous to themselves; and multitudes besides, with narrow incomes, to whom these quiet retreats are so many cities of refuge.

Such, in one view, they really are; and yet in another they have a vicious constitution. Cathedral cities in England, imperial cities without manufactures in Germany, are all in an improgressive condition. The public employments of every class in such places continue the same from generation to generation. The amount of superior families oscillates rather than changes; that is, it fluctuates within fixed limits: and, for all inferior families, being composed either of shopkeepers or of menial servants, they are determined by the number, or, which, on a large average, is the same, by the pecuniary power, of their employers. Hence it arises, that room is made for one man, in whatever line of dependence, only by the death of another; and the constant increments of the population are carried off into other cities. Not less is the difference of such cities as regards the standard of manners: how striking is the soft and urbane tone of the lower orders in a cathedral city, or in a watering place dependent upon ladies, contrasted with the bold, often insolent, demeanour of a self-dependent artisan or mutinous mechanic of Manchester and Glasgow.

Children, however, are interested in the state of society around them, chiefly as it affects their parents. Those of Goethe were respectable, and perhaps tolerably representative of the general condition in their own rank. An English authoress of great talent, in her *Characteristics of Goethe*, has too much countenanced the notion that he owed his intellectual advantages exclusively to his mother. Of this there is no proof. His mother wins more esteem from the reader of this day, because she was a cheerful woman, of serene temper, brought into advantageous comparison with a husband much older than herself, whom circumstances had rendered moody, fitful, sometimes capricious, and confessedly obstinate in that degree which Pope has taught us to think connected with inveterate error:

> Stiff in opinion, always in the wrong,

unhappily presents an association too often actually occurring in nature, to leave much chance for error in presuming either quality from the other. And, in fact, Goethe's father was so uniformly obstinate in pressing his own views upon all who belonged to him, whenever he did come forward in an attitude of activity, that his family had much reason to be thankful for the rarity of such displays. Fortunately for them, his indolence neutralized his obstinacy. And the worst shape in which his troublesome temper showed itself, was in what concerned the religious reading of the family. Once begun, the worst book as well as the best, the longest no less than the shortest, was to be stedfastly read through to the last word of the last volume; no excess of yawning availed to obtain a reprieve, not, adds his son, though he were himself the leader of the yawners. As an illustration, he mentions Bowyer's *History of the Popes;* which awful series of records, the catacombs, as it were, in the palace of history, were actually traversed from one end to the other of the endless *suite* by the unfortunate house of Goethe. Allowing, however, for the father's unamiableness in this one point, upon all intellectual ground both parents seem to have met very much upon a level. Two illustrations may suffice, one of which occurred during the infancy of Goethe. The science of education was at that time making its first rude motions towards an ampler development; and, amongst other reforms then floating in the general mind, was one for eradicating the childish fear of ghosts, &c. The young Goethes, as it happened, slept not in separate beds only, but in separate rooms; and not unfrequently the poor children, under the stinging terrors of their lonely situation, stole away from their "forms," to speak in the hunter's phrase, and sought to rejoin each other. But in these attempts they were liable to surprises from the enemy; papa and mamma were both on the alert, and often intercepted the young deserter by a cross march or an ambuscade; in which cases each had a separate policy for enforcing obedience. The father, upon his general system of "perseverance," compelled the fugitive back to his quarters, and, in effect, exhorted him to persist in being frightened out of his wits. To his wife's gentle heart that course appeared cruel, and she reclaimed the delinquent by bribes; the peaches which her garden walls produced being the fund from which she chiefly drew her supplies for this branch of the secret service. What were her winter bribes, when the long nights would seem to lie heaviest on the exchequer, is not said. Speaking seriously, no man of sense can suppose that a course of suffering from terrors the most awful, under whatever influence supported, whether under the naked force of compulsion, or of *that* connected with bribes, could have any final effect in mitigating the passion of awe, connected, by our very dreams, with the shadowy and the invisible, or in tranquillizing the infantine imagination.

A second illustration involves a great moral event in the history of Goethe, as it was, in fact, the first occasion of his receiving impressions at war with his religious creed. Piety is so beautiful an ornament of the youthful mind, doubt or distrust so unnatural a growth from confiding innocence, that an infant freethinker is heard of not so much with disgust as with perplexity. A sense of the ludicrous is apt to intermingle; and we lose our natural horror of the result in wonder at its origin. Yet in this instance there is no room for doubt; the fact and the occasion are both on record; there can be no question about the date; and, finally, the accuser is no other than the accused. Goethe's own pen it is which proclaims, that already, in the early part of his seventh year, his reliance upon God as a moral governor had suffered a violent shock, was shaken, if not undermined. On the 1st of November 1755 occurred the great earthquake at Lisbon. Upon a double account, this event occupied the thoughts of all Europe for an unusual term of time; both as an expression upon a larger scale than usual of the mysterious physical agency concerned in earthquakes, and also for the awful human tragedy[1] which attended either the earthquake itself, or its immediate sequel in the sudden irruption of the Tagus. Sixty thousand persons, victims to the dark power in its first or its second *avatar*, attested the Titanic scale upon which it worked. Here it was that the shallow piety of the Germans found a stumbling-block. Those who have read any circumstantial history of the physical signs which preceded this earthquake, are aware that in England and Northern Germany many singular phenomena were observed, more or less manifestly connected with the same dark agency which terminated at Lisbon, and running before this final catastrophe at times so accurately varying with the distances, as to furnish something like a scale for measuring the velocity with which it moved. These German phenomena, circulated rapidly over all Germany by the journals of every class, had seemed to give to the Germans a nearer and more domestic interest in the great event, than belonged to them merely in their universal character of humanity. It is also well known to observers of national characteristics, that amongst the Germans the household charities, the *pieties of the hearth*, as they may be called, exist, if not really in greater strength, yet with much less of the usual balances or restraints. A German father, for example, is like the grandfather of other nations; and thus a piety, which in its own nature scarcely seems liable to excess, takes, in its external aspect, too often an air of effeminate imbecility. These two considerations are necessary to explain the intensity with which this Lisbon tragedy laid hold of the German mind, and chiefly under the one single aspect of its *undistinguishing* fury. Women, children, old men—these, doubtless, had been largely involved in the perishing sixty thousand; and that reflection, it would seem from Goethe's account, had so far embittered the sympathy of the Germans with their distant Portuguese brethren, that, in the Frankfort discussions, sullen murmurs had gradually ripened into bold impeachments of Providence. There can be no gloomier form of infidelity than that which questions the moral attributes of the Great Being in whose hands are the final destinies of us all. Such, however, was the form of Goethe's earliest scepticism, such its origin; caught up from the very echoes which rang through the streets of Frankfort when the subject occupied all men's minds: and such, for any thing that appears, continued to be its form thenceforwards to the close of his life, if speculations so crude could be said to have any form at all. Many are the analogies, some close ones, between England and Germany with regard to the circle of changes they have run through, political or social, for a century back. The challenges are frequent to a comparison; and sometimes the result would be to the advantage of Germany, more often to ours. But in religious philosophy, which in reality is the true *popular* philosophy, how vast is the superiority on the side of this country. Not a shopkeeper or mechanic, we may venture to say, but would have felt this obvious truth, that surely the Lisbon earthquake yielded no fresh lesson, no peculiar moral, beyond what belonged to every man's experience in every age. A passage in the New Testament about the fall of the tower of Siloam, and the just construction of that event, had already anticipated the difficulty, if such it could be thought. Not to mention, that calamities upon the same scale in the earliest age of Christianity, the fall of the amphitheatre at Fidenæ, or the destruction of Pompeii, had presented the same problem as the Lisbon earthquake. Nay, it is presented daily in the humblest individual case, where wrong is triumphant over right, or innocence confounded with guilt in one common disaster. And that the parents of Goethe should have authorized his error, if only by their silence, argues a degree of ignorance in them which could not have co-existed with much superior knowledge in the public mind.

Goethe, in his Memoirs (book vi.), commends his father for the zeal with which he superintended the education of

---

[1] Of this no picture can ever hope to rival that hasty one sketched in the letter of the chaplain to the Lisbon factory. The plague of Athens as painted by Thucydides or Lucretius, nay even the fabulous plague of London by De Foe, contain no scenes or situations equal in effect to some in this plain historic statement. Nay, it would perhaps be difficult to produce a passage from Ezekiel, from Æschylus, or from Shakspeare, which would so profoundly startle the sense of sublimity as one or two of his incidents.

Goethe.

his children. But apparently it was a zeal without knowledge. Many things were taught imperfectly, but all casually, and as chance suggested them. Italian was studied a little, because the elder Goethe had made an Italian tour, and had collected some Italian books, and engravings by Italian masters. Hebrew was studied a little, because Goethe the son had a fancy for it, partly with a view to theology, and partly because there was a Jewish quarter, gloomy and sequestrated, in the city of Frankfort. French offered itself no doubt on many suggestions, but originally on occasion of a French theatre, supported by the staff of the French army when quartered in the same city. Latin was gathered in a random way from a daily sense of its necessity. English upon the temptation of a stranger's advertisement, promising upon moderate terms to teach that language in four weeks; a proof, by the way, that the system of bold innovations in the art of tuition had already commenced. Riding and fencing were also attempted under masters apparently not very highly qualified, and in the same desultory style of application. Dancing was taught to his family, strange as it may seem, by Mr Goethe himself. There is good reason to believe that not one of all these accomplishments was possessed by Goethe, when ready to visit the university, in a degree which made it practically of any use to him. Drawing and music were pursued confessedly as amusements; and it would be difficult to mention any attainment whatsoever which Goethe had carried to a point of excellence in the years which he spent under his father's care, unless it were his mastery over the common artifices of metre and the common topics of rhetoric, which fitted him for writing what are called occasional poems and *impromptus*. This talent he possessed in a remarkable degree, and at an early age; but he owed its cultivation entirely to himself.

In a city so orderly as Frankfort, and in a station privileged from all the common hardships of poverty, it can hardly be expected that many incidents should arise, of much separate importance in themselves, to break the monotony of life; and the mind of Goethe was not contemplative enough to create a value for common occurrences through any peculiar impressions which he had derived from them. In the years 1763 and 1764, when he must have been from fourteen to fifteen years old, Goethe witnessed the inauguration and coronation of a king of the Romans, a solemn spectacle connected by prescription with the city of Frankfort. He describes it circumstantially, but with very little feeling, in his Memoirs. Probably the prevailing sentiment, on looking back at least to this transitory splendour of dress, processions, and ceremonial forms, was one of cynical contempt. But this he could not express, as a person closely connected with a German court, without giving much and various offence. It is with some timidity even that he hazards a criticism upon single parts of the costume adopted by some of the actors in that gorgeous scene. White silk stockings, and pumps of the common form, he objects to as out of harmony with the antique and heraldic aspects of the general costume, and ventures to suggest either boots or sandals as an improvement. Had Goethe felt himself at liberty from all restraints of private consideration in composing these Memoirs, can it be doubted that he would have taken his retrospect of this Frankfort inauguration from a different station; from the station of that stern revolution which, within his own time, and partly under his own eyes, had shattered the whole imperial system of thrones, in whose equipage this gay pageant made so principal a figure, had humbled Cæsar himself to the dust, and left him an emperor without an empire. We at least, for our parts, could not read without some emotion one little incident of these gorgeous scenes recorded by Goethe, namely, that when the emperor, on rejoining his wife for a few moments, held up to her notice his own hands and arms arrayed in the antique habiliments of Charlemagne, Maria Theresa—she whose children were summoned to so sad a share in the coming changes—gave way to sudden bursts of loud laughter, audible to the whole populace below her. That laugh on surveying the departing pomps of Charlemagne, must, in any contemplative ear, have rung with a sound of deep significance, and with something of the same effect which belongs to a figure of death introduced by a painter, as mixing in the festal dances of a bridal assembly.

These pageants of 1763–64 occupy a considerable space in Goethe's Memoirs, and with some *logical* propriety at least, in consideration of their being exclusively attached to Frankfort, and connected by manifold links of person and office with the privileged character of the city. Perhaps he might feel a sort of narrow local patriotism in recalling these scenes to public notice by description, at a time when they had been irretrievably extinguished as realities. But, after making every allowance for their local value to a Frankfort family, and for their memorable splendour, we may venture to suppose that by far the most impressive remembrances which had gathered about the boyhood of Goethe, were those which pointed to Frederick of Prussia. This singular man, so imbecile as a pretender to philosophy and new lights, so truly heroic under misfortunes, was the first German who created a German interest, and gave a transient unity to the German name, under all its multiplied divisions. Were it only for this conquest of difficulties so peculiar. he would deserve his German designation of Fred. the Unique (*Fritz der einzige*). He had been partially tried and known previously; but it was the Seven Years' War which made him the popular idol. This began in 1756; and to Frankfort, in a very peculiar way, that war brought dissensions and heart-burnings in its train. The imperial connections of the city with many public and private interests, pledged it to the anti-Prussian cause. It happened also that the truly German character of the reigning imperial family, the domestic habits of the empress and her young daughters, and other circumstances, were of a nature to endear the ties of policy: self-interest and affection pointed in the same direction. And yet were all these considerations allowed to melt away before the brilliant qualities of one man, and the romantic enthusiasm kindled by his victories. Frankfort was divided within herself; the young and the generous were all dedicated to Frederick: a smaller party, more cautious and prudent, were for the imperialists. Families were divided upon this question against families, and often against themselves; feuds, begun in private, issued often into public violence; and, according to Goethe's own illustration, the streets were vexed by daily brawls, as hot and as personal as of old between the Capulets and Montagues.

These dissensions, however, were pursued with not much personal risk to any of the Goethes, until a French army passed the Rhine as allies of the imperialists. One corps of this force took up their quarters in Frankfort; and the Comte Thorane, who held a high appointment on the staff, settled himself for a long period of time in the spacious mansion of Goethe's father. This officer, whom his place made responsible for the discipline of the army in relation to the citizens, was naturally by temper disposed to moderation and forbearance. He was indeed a favourable specimen of French military officers under the old system; well bred, not arrogant, well informed, and a friend of the fine arts. For painting, in particular, he professed great regard and some knowledge. The Goethes were able to forward his views amongst German artists; whilst, on the other hand, they were pleased to have thus an opportunity of directing his patronage towards some of their own needy connections. In this exchange of good offices, the two parties were for some time able to maintain a fair appearance of reciprocal good will. This on the comte's side, if not particularly warm, was probably sincere; but in Goethe the father it was a masque for inveterate dislike. A natural ground of this existed in the original relations between them. Under whatever disguise or pretext, the Frenchman was in fact a military intruder: he occupied the best suit of rooms in the house, used the furniture as his own; and, though upon private motives he abstained from doing all the injury which his situation authorized (so as in particular to have spread his fine military maps upon the floor rather than disfigure the decorated walls by nails), still he claimed credit, if not services of requital, for all such instances of forbearance. Here were grievances enough; but, in addition to these, the comte's official appointments drew upon him a weight of daily business, which kept the house in a continual uproar. Farewell to the quiet of a literary amateur, and the orderliness of a German household. Finally, the comte was a Frenchman. These were too many assaults upon one man's patience. It will be readily understood, therefore, how it happened, that, whilst Goethe's gentle-minded mother, with her flock of children, continued to be on the best terms with Comte Thorane, the master of the house kept moodily aloof, and retreated from all intercourse.

Goethe, in his own Memoir, enters into large details upon this subject; and from him we shall borrow the *denouement* of the tale. A crisis had for some time been lowering over the French affairs in Frankfort; things seemed ripening for a battle; and at last it came. Flight, siege, bombardment, possibly a storm, all danced before the eyes of the terrified citizens. Fortunately, however, the battle took place at the distance of four or five miles from Frankfort. Monsieur le Comte was absent, of course, on the field of battle. His unwilling host thought that on such an occasion he also might go out in quality of spectator; and with this purpose he connected another, worthy of a Parson Adams. It is his son who tells the story, whose filial duty was not proof against his sense of the ludicrous. The old gentleman's hatred of the French had by this time brought him over to his son's admiration of the Prussian hero. Not doubting for an instant that victory would follow that standard, he resolved on this day to offer in person his congratulations to the Prussian army, whom he already viewed as his liberator from a domestic nuisance. So purposing, he made his way cautiously to the suburbs; from the suburbs, still listening at each advance, he went forward to the country; totally forgetting, as his son insists, that, however completely beaten, the French army must still occupy some situation or other between himself and his German deliverer. Coming, however, at length to a heath, he found some of those marauders usually to be met with in the rear of armies, prowling about, and at intervals amusing themselves with shooting at a mark. For want of a better, it seemed not improbable that a large German head might answer their purpose: certain signs admonished him of this, and the old gentleman crept back to Frankfort. Not many hours after came back also the comte, by no means creeping, however; on the contrary, crowing with all his might for a victory which he averred himself to have won. There had in fact been an affair, but on no very great scale, and with no distinguished results. Some prisoners, however, he brought, together with some wounded; and naturally he expected all well disposed persons to make their compliments of congratulation upon his triumph. Of this duty poor Mrs Goethe and her children cheerfully acquitted themselves that same night; and Monsieur le Comte was so well pleased with the sound opinions of the little Goethes, that he sent them in return a collection of sweetmeats and fruits. All promised to go well; intentions, after all, are not acts; and there certainly is not, nor ever was, any treason in taking a morning's walk. But, as ill luck would have it, just as Mr Goethe was passing the comte's door, out came the comte in person, purely by accident, as we are told; but we suspect that the surly old German, either under his morning hopes or his evening disappointments, had talked with more frankness than prudence. "Good evening to you, Herr Goethe," said the comte; "you are come, I see, to pay your tribute of congratulation. Somewhat of the latest, to be sure; but no matter." "By no means," replied the German; "by no means; *mit nichten*. Heartily I wished, the whole day long, that you and your cursed gang might all go to the devil together." Here was plain speaking, at least. The Comte Thorane could no longer complain of dissimulation. His first movement was to order an arrest; and the official interpreter of the French army took to himself the whole credit that he did not carry it into effect. Goethe takes the trouble to report a dialogue, of length and dulness absolutely incredible, between this interpreter and the comte. No such dialogue, we may be assured, ever took place. Goethe may, however, be right in supposing that, amongst a foreign soldiery, irritated by the pointed contrasts between the Frankfort treatment of their own wounded, and of their prisoners who happened to be in the same circumstances, and under a military council not held to any rigorous responsibility, his father might have found no very favourable consideration of his case. It is well, therefore, that after some struggle the comte's better nature triumphed. He suffered Mrs Goethe's merits to outweigh her husband's delinquency; countermanded the order for arrest, and, during the remainder of their connection, kept at such a distance from his moody host as was equally desirable for both. Fortunately that remainder was not very long. Comte Thorane was soon displaced; and the whole army was soon afterwards withdrawn from Frankfort.

In his fifteenth year Goethe was entangled in some connection with young people of inferior rank, amongst whom was Margaret, a young girl about two years older than himself, and the object of his first love. The whole affair, as told by Goethe, is somewhat mysterious. What might be the final views of the elder parties it is difficult to say; but Goethe assures us that they used his services only in writing an occasional epithalamium, the pecuniary acknowledgment for which was spent jovially in a general banquet. The magistrates, however, interfered, and endeavoured to extort a confession from Goethe: he, as the son of a respectable family, was to be pardoned; the others to be punished. No confession, however, could be extorted; and for his own part he declares that, beyond the offence of forming a clandestine connection, he had nothing to confess. The affair terminated, as regarded himself, in a severe illness. Of the others we hear no more.

The next event of importance in Goethe's life was his removal to college. His own wishes pointed to Göttingen, but his father preferred Leipsic. Thither accordingly he went, but he carried his obedience no farther. Declining the study of jurisprudence, he attached himself to general literature. Subsequently he removed to the university of Strasburg; but in neither place could it be said that he pursued any regular course of study. His health suffered at times during this period of his life; at first from an affection of the chest, caused by an accident on his first journey to Leipsic; the carriage had stuck fast in the muddy roads, and Goethe exerted himself too much in assisting to extricate the wheels. A second illness connected with the digestive organs brought him into considerable danger.

After his return to Frankfort, Goethe commenced his career as an author. In 1773, and the following year, he made his maiden essay in *Goetz of Berlichingen*, a drama (the translation of which, remarkably enough, was destined to be the literary *coup d'essai* of Sir Walter Scott), and in the far-famed *Werther*. The first of these was pirated; and in consequence the author found some difficulty in paying for the paper of the genuine edition, which part of the expense, by his contract with the publisher, fell upon himself. The general and early popularity of the second work is well known. Yet, except in so far as it might spread his name abroad, it cannot be supposed to have had much influence in attracting that potent patronage which now began to determine the course of his future life. So much we collect from the account which Goethe himself has left us of this affair in its earliest stages.

"I was sitting alone in my room," says he, "at my father's house in Frankfort, when a gentleman entered, whom at first I took for Frederick Jacobi, but soon discovered by the dubious light to be a stranger. He had a military air; and announcing himself by the name of Von Knebel, gave me to understand in a short explanation, that being in the Prussian service, he had connected himself, during a long residence at Berlin and Potsdam, with the literati of those places; but that at present he held the appointment from the court of Weimar of travelling tutor to the Prince Constantine. This I heard with pleasure; for many of our friends had brought us the most interesting accounts from Weimar, in particular that the Duchess Amelia, mother of the young grand duke and his brother, summoned to her assistance in educating her sons the most distinguished men in Germany; and that the university of Jena co-operated powerfully in all her liberal plans. I was aware also that Wieland was in high favour; and that the German Mercury (a literary journal of eminence) was itself highly creditable to the city of Jena, from which it issued. A beautiful and well-conducted theatre had besides, as I knew, been lately established at Weimar. This, it was true, had been destroyed; but that event, under common circumstances so likely to be fatal as respected the present, had served only to call forth the general expression of confidence in the young prince as a restorer and upholder of all great interests, and true to his purposes under any calamity." Thinking thus, and thus prepossessed in favour of Weimar, it was natural that Goethe should be eager to see the prince. Nothing was easier. It happened that he and his brother Constantine were at this moment in Frankfort, and Von Knebel willingly offered to present Goethe. No sooner said than done; they repaired to the hotel, where they found the illustrious travellers, with Count Goertz, the tutor of the elder.

Upon this occasion an accident, rather than any previous reputation of Goethe, was probably the determining occasion which led to his favour with the future sovereign of Weimar. A new book lay upon the table; that none of the strangers had read it, Goethe inferred from observing that the leaves were as yet uncut. It was a work of Moser (*Patriotische Phantasien*); and, being political rather than literary in its topics, it presented to Goethe, previously acquainted with its outline, an opportunity for conversing with the prince upon subjects nearest to his heart, and of showing that he was not himself a mere studious recluse. The opportunity was not lost; the prince and his tutor were much interested, and perhaps a little surprised. Such subjects have the further advantage, according to Goethe's own illustration, that, like the Arabian thousand and one nights, as conducted by the Sultana Scheherezade, "never ending, still beginning," they rarely come to any absolute close, but so interweave one into another, as still to leave behind a large arrear of interest. In order to pursue the conversation, Goethe was invited to meet them soon after at Mentz. He kept the appointment punctually; made himself even more agreeable; and finally received a formal invitation to enter the service of this excellent prince, who was now beginning to collect around him all those persons who have since made Weimar so distinguished a name in connection with the German literature. With some opposition from his father, who held up the rupture between Voltaire and Frederick of Prussia as a precedent applying to all possible connections of princes and literati, Goethe accepted the invitation; and henceforwards, for upwards of fifty-five years, his fortunes were bound up with those of the ducal house of Weimar.

The noble part which that house played in the great modern drama of German politics is well known, and would have been better known had its power been greater. But the moral value of its sacrifices and its risks is not the less. Had greater potentates shown equal firmness, Germany would not have been laid at the feet of Napoleon. In 1806 the grand duke was aware of the peril which awaited the allies of Prussia; but neither his heart nor his conscience would allow of his deserting a friend in whose army he held a principal command. The decisive battle took place in his own territory, and not far from his own palace and city of Weimar. Personally he was with the Prussian army; but his excellent consort stayed in the palace to encourage her subjects, and as far as possible to conciliate the enemy by her presence. The fortune of that great day, the 14th of October 1806, was decided early; and the awful event was announced by a hot retreat and a murderous pursuit through the streets of the town. In the evening Napoleon arrived in person; and now came the trying moment. "The duchess," says an Englishman well acquainted with Weimar and its court, "placed herself on the top of the staircase to greet him with the formality of a courtly reception. Napoleon started when he beheld her, *Qui êtes vous ?* he exclaimed with characteristic abruptness. *Je suis la Duchesse de Weimar. Je vous plains*, he retorted fiercely, *J'écraserai votre mari;* he then added, 'I shall dine in my apartment,' and rushed by her. The night was spent on the part of the soldiery in all the horrid excesses of rapine. In the morning the duchess sent to inquire concerning the health of his majesty the emperor, and to solicit an audience. He, who had now benefited by his dreams, or by his reflections, returned a gracious answer, and invited himself to breakfast with her in her apartment." In the conversation which ensued, Napoleon asked her if her husband were mad, upon which she justified the duke by appealing to his own magnanimity, asking in her turn if his majesty would have approved of his deserting the king of Prussia at the moment when he was attacked by so potent a monarch as himself. The rest of the conversation was in the same spirit, uniting with a sufficient concession to the circumstances of the moment a dignified vindication of a high-minded policy. Napoleon was deeply impressed with respect for her, and loudly expressed it. For her sake, indeed, he even affected to pardon her husband, thus making a merit with her of the necessity which he felt, from other motives, for showing forbearance towards a family so nearly allied to that of St Petersburg. In 1813 the grand duke was found at his post in that great gathering of the nations which took place on the stupendous fields of Leipsic, and was complimented by the allied sovereigns as one of the most faithful amongst the faithful to the great cause, yet undecided, of national independence.

With respect to Goethe, as a councillor so near the duke's person, it may be supposed that his presence was never wanting where it promised to be useful. In the earlier campaigns of the duke, Goethe was his companion; but in the final contest with Napoleon he was unequal to the fatigues of such a post. In all the functions of peace, however, he continued to be a useful servant to the last, though long released from all official duties. Each had indeed most honourably earned the gratitude of the other. Goethe had surrendered the flower of his years and the best energies of his mind to the service of his serene master. On the other hand, that master had to him been at once his Augustus and his Mæcenas; such is his own expression. Under him he had founded a family, raised an estate, obtained titles and decorations from various courts; and in the very vigour of his life he had been allowed to retire, with all the honours of long service, to the sanctuary of his own study, and to the cultivation of his leisure, as the very highest mode in which he could further the public interest.

The life of Goethe was so quiet and so uniform after the year 1775, when he may first be said to have entered into active life, by taking service with the Duke of Weimar, that a biographer will find hardly any event to notice, except two journeys to Italy, and one campaign in 1792, until he draws near the close of his long career. It cannot interest an English reader to see the dates of his successive appointments. It is enough to know that they soon raised him to as high a station as was consistent with literary leisure; and that he had from the beginning enjoyed the unlimited confidence of his sovereign. Nothing remained, in fact, for the subject to desire which the prince had not previously volunteered. In 1825, they were able to look back upon a course of uninterrupted friendship, maintained through good and evil fortunes unexampled in their agitation and interest for fifty years. The duke commemorated this remarkable event by a jubilee, and by a medal in honour of Goethe. Full of years and honour, this eminent man might now begin to think of his departure. However, his serenity continued unbroken nearly for two years more, when his illustrious patron died. That shock was the first which put his fortitude to trial. In 1830 others followed; the duchess, who had won so much admiration from Napoleon, died; then followed his own son; and there remained little now to connect his wishes with the earth. The family of his patron he had lived to see flourishing in his descendants to the fourth generation. His own grandchildren were prosperous and happy. His intellectual labours were now accomplished. All that remained to wish for was a gentle dismission. This he found in the spring of 1832. After a six days' illness, which caused him no apparent suffering, on the morning of the 22d of March he breathed away as if into a gentle sleep, surrounded by his daughter-in-law and her children. Never was a death more in harmony with the life it closed; both had the same character of deep and absolute serenity.

Such is the outline of Goethe's life, traced through its principal events. But as these events, after all, borrow their interest mainly from the consideration allowed to Goethe as an author, and as a model in the German literature,—*that* being the centre about which all secondary feelings of interest in the man must finally revolve,—it thus becomes a duty to throw a glance over his principal works. Dismissing his songs, to which has been ascribed by some critics a very high value for their variety and their lyrical enthusiasm; dismissing also a large body of short miscellaneous poems, suited to the occasional circumstances in which they arose; we may throw the capital works of Goethe into two classes, philosophic novels, and dramas. The novels, which we call *philosophic* by way of expressing their main characteristic in being written to serve a preconceived purpose, or to embody some peculiar views of life, or some aspects of philosophic truth, are three, viz. the *Werther's Leiden*; secondly, the *Wilhelm Meister*; and, lastly, the *Wahloer-wandschaften*. The first two exist in English translations; and though the *Werther* had the disadvantage of coming to us through a French version, already, perhaps, somewhat coloured and distorted to meet the Parisian standards of sentiment, yet, as respects Goethe and his reputation amongst us, this wrong has been redressed, or compensated at least, by the good fortune of his *Wilhelm Meister*, in falling into the hands of a translator whose original genius qualified him for sympathizing even to excess with any real merits in that work. This novel is in its own nature and purpose sufficiently obscure; and the commentaries which have been written upon it by the Humboldts, Schlegels, &c. make the enigma still more enigmatical. We shall not venture abroad upon an ocean of discussion so truly dark, and at the same time so illimitable. Whether it be qualified to excite any deep and *sincere* feeling of one kind or another in the German mind,—in a mind trained under German discipline,—this we will consent to waive as a question not immediately interesting to ourselves. Enough that it has not gained, and will not gain, any attention in this country; and this not only because it is thoroughly deficient in all points of attraction to readers formed upon our English literature, but because in some capital circumstances it is absolutely repulsive. We do not wish to offend the admirers of Goethe; but the simplicity of truth will not allow us to conceal, that in various points of description or illustration, and sometimes in the very outline of the story, the *Wilhelm Meister* is at open war, not with decorum and good taste merely, but with moral purity and the dignity of human nature. As a novelist, Goethe and his reputation are problems, and likely to continue such, to the countrymen of Mrs Inchbald, Miss Harriet Lee, Miss Edgeworth, and Sir Walter Scott. To the dramatic works of Goethe we are disposed to pay more homage; but neither in the absolute amount of our homage at all professing to approach his public admirers, nor to distribute the proportions of this homage amongst his several performances according to the graduations of *their* scale. The *Iphigenie* is built upon the old subject of Iphigenia in Tauris, as treated by Euripides and other Grecian dramatists; and, if we are to believe a Schlegel, it is in beauty and effect a mere echo or reverberation from the finest strains of the old Grecian music. That it is somewhat nearer to the Greek model than a play after the fashion of Racine, we grant. Setting aside such faithful transcripts from the antique as the Samson Agonistes, we might consent to view Goethe as that one amongst the moderns who had made the closest approximation to the Greek stage: *Proximus*, we might say, with Quintilian, but with him we must add, "*sed longo intervallo;* and if in the second rank, yet nearer to the third than to the first. Two other dramas, the *Clavigo* and the *Egmont*, fall below the *Iphigenie* by the very character of their pretensions; the first as too openly renouncing the grandeurs of the ideal; the second as confessedly violating the historic truth of character, without temptation to do so, and without any consequent indemnification. The *Tasso* has been supposed to realize an Italian beauty of genial warmth and of sunny repose; but from the common defect of German criticism—the absence of all sufficient illustrations—it is as difficult to understand the true nature and constituents of the supposed Italian standard set up for the regulation of our judgments, as it is to measure the degree of approach made to that standard in this particular work. *Eugenie* is celebrated for the artificial burnish of the style, but otherwise has been little relished. It has the beauty of marble sculpture, say the critics of Goethe, but also the coldness. We are not often disposed to quarrel with these critics as *below* the truth in their praises; in this instance we are. The *Eugenie* is a fragment, or (as Goethe himself called it in conversation) a *torso*, being only the first drama in a trilogy or series of three dramas, each having a separate plot, whilst all are parts of a more general and comprehensive plan. It may be charged with languor in the movement of the action, and with excess of illustration. Thus, *e. g.* the grief of the prince for the supposed death of his daughr, is the monotonous topic which occupies one entire act. But the situations, though not those of *scenical* distress, are so far from being unexciting, that, on the contrary, they are too powerfully afflicting.

The lustre of all these performances, however, is eclipsed by the unrivalled celebrity amongst German critics of the *Faust*. Upon this it is better to say nothing than too little. How trifling an advance has been made towards clearing the ground for any sane criticism, may be understood from this fact, that as yet no two people have agreed about the meaning of any separate scene, or about the drift of the whole. Neither is this explained by saying, that until lately the *Faust* was a fragment; for no additional light has dawned upon the main question since the publication of the latter part.

One work there is of Goethe's which falls into neither of the classes here noticed; we mean the *Hermann and Dorothea*, a narrative poem, in hexameter verse. This appears to have given more pleasure to readers not critical, than any other work of its author; and it is remarkable that it traverses humbler ground, as respects both its subject, its characters, and its scenery. From this, and other indications of the same kind, we are disposed to infer that Goethe mistook his destination; that his aspiring nature misled him; and that his success would have been greater had he confined himself to the *real* in domestic life, without raising his eyes to the *ideal*.

We must also mention, that Goethe threw out some novel speculations in physical science, and particularly in physiology, in the doctrine of colours, and in comparative anatomy, which have divided the opinions of critics even more than any of those questions which have arisen upon points more directly connected with his avowed character of poet.

It now remains to say a few words by way of summing up his pretensions as a man, and his intellectual power in the age to which he belonged. His rank and value as a moral being are so plain as to be legible to him who runs. Everybody must feel that his temperament and constitutional tendency was of that happy quality, the animal so nicely balanced with the intellectual, that with any ordinary measure of prosperity he could not be otherwise than a good man. He speaks himself of his own "virtue," *sans phrase*; and we tax him with no vanity in doing so. As a young man even at the universities, which at that time were barbarously sensual in Germany, he was (for so much we collect from his own Memoirs) eminently capable of self-restraint. He preserves a tone of gravity, of sincerity, of respect for female dignity, which we never find associated with the levity and recklessness of vice. We feel throughout, the presence of one who, in respecting others, respects himself; and the cheerfulness of the presiding tone persuades us at once that the narrator is in a healthy moral condition, fears no ill, and is conscious of having meditated none. Yet at the same time we cannot disguise from ourselves that the moral temperament of Goethe was one which demanded prosperity: had he been called to face great afflictions, singular temptations, or a billowy and agitated course of life, our belief is that his nature would have been found unequal to the strife; he would have repeated the mixed and moody character of his father. Sunny prosperity was essential to his nature; his virtues were adapted to that condition. And happily that was his fate. He had no personal misfortunes; his path was joyous in this life; and even the reflex sorrow from the calamities of his friends did not press too heavily on his sympathies; none of these were in excess either as to degree or duration.

In this estimate of Goethe as a moral being, few people will differ with us, unless it were the religious bigot. And to him we must concede thus much, that Goethe was not that religious creature which by nature he was intended to become. This is to be regretted: Goethe was naturally pious, and reverential towards higher natures; and it was in the mere levity or wantonness of youthful power, partly also through that early false bias growing out of the Lisbon earthquake, that he falsified his original destination. Do we mean, then, that a childish error could permanently master his understanding? Not so; *that* would have been corrected with his growing strength. But having once arisen, it must for a long time have moulded his feelings; *until* corrected, it must have impressed a corresponding false bias upon his practical way of viewing things; and that sort of false bias, once established, might long survive a mere error of the understanding. One thing is undeniable. Goethe had so far corrupted and clouded his natural mind, that he did not look up to God, or the system of things beyond the grave, with the interest of reverence and awe, but with the interest of curiosity.

Goethe, however, in a moral estimate, will be viewed pretty uniformly. But Goethe intellectually, Goethe as a power acting upon the age in which he lived, that is another question. Let us put a case; suppose that Goethe's death had occurred fifty years ago, that is, in the year 1785, what would have been the general impression? Would Europe have felt a shock? Would Europe have been sensible even of the event? Not at all: it would have been obscurely noticed in the newspapers of Germany, as the death of a novelist who had produced some effect about ten years before. In 1832, it was announced by the post-horns of all Europe as the death of him who had written the *Wilhelm Meister*, the *Iphigenie*, and the *Faust*, and who had been enthroned by some of his admirers on the same seat with Homer and Shakspeare, as composing what they termed the *trinity of men of genius*. And yet it is a fact, that, in the opinion of some amongst the acknowledged leaders of our own literature for the last twenty-five years, the *Werther* was superior to all which followed it, and for mere power was the paramount work of Goethe. For ourselves, we must acknowledge our assent upon the whole to this verdict; and at the same time we will avow our belief that the reputation of Goethe must decline for the next generation or two, until it reaches its just level. Three causes, we are persuaded, have concurred to push it so far beyond the proportion of real and genuine interest attached to his works, for in Germany his works are little read, and in this country not at all: *First*, his extraordinary age; for the last twenty years Goethe had been the patriarch of the German literature: *secondly*, the splendour of his official rank at the court of Weimar; he was the minister and private friend of the patriot sovereign amongst the princes of Germany: *thirdly*, the quantity of enigmatical and unintelligible writing which he has designedly thrown into his latter works, by way of keeping up a system of discussion and strife upon his own meaning amongst the critics of his country. These disputes, had his meaning been of any value in his own eyes, he would naturally have settled by a few authoritative words from himself; but it was his policy to keep alive the feud in a case where it was of importance that his name should continue to agitate the world, but of none at all that he should be rightly interpreted. (W. W. W.)

GOG and MAGOG, two names generally joined together in Scripture. Moses, however, speaks of Magog the son of Japhet, but says nothing of Gog. Gog was prince of Magog, according to Ezekiel, in whose writings Magog signifies the country or people, and Gog the king of that country. The generality of the ancients considered Magog as the father of the Scythians and Tartars; and several interpreters discovered many traces of their name in the provinces of Great Tartary. Others have been of opinion that the Persians were the descendants of Magog; and some have imagined that the Goths were descended from Gog and Magog, and that the wars described by Ezekiel,

Goggrah
||
Goguet.

and undertaken by Gog against the saints, were no other than those which the Goths carried on in the fifth age against the Roman empire. Bochart has placed Gog in the neighbourhood of Caucasus. He derives the name of this celebrated mountain from the Hebrew *Gog Chasan*, the Fortress of Gog. He maintains that Prometheus, who is said to have been chained to Caucasus by Jupiter, is no other than Gog. In Iberia there was a province called the *Gogarene*. Lastly, the generality of writers believe that Gog and Magog, mentioned in Ezekiel and the Revelation, are to be taken in an allegorical acceptation, as signifying such princes as were enemies to the church and saints. Thus, by Gog in Ezekiel many understand Antiochus Epiphanes, the persecutor of the Jews who remained firm to their religion; and by the person of the same name in the Revelation they suppose to be meant Antichrist, the great enemy of the church and faithful. Some have endeavoured to prove that the Gog spoken of in Ezekiel, and Cambyses king of Persia, were one and the same person; and that Gog and Magog in the Revelation denote generally the enemies and persecutors of the church.

GOGGRAH, a river of Hindustan, which forces its way through the great Himalaya chain, though its exact source has never been ascertained. It afterwards falls into the Sareyn at Swarojadwara, the united streams afterwards being named indifferently the Goggrah, Sarfew, or Deva river. This river flows through the district of Kemaon and province of Oude, and at Manjee joins the Ganges, of which it is one of the largest tributary streams. It is navigable for large boats to the foot of the hills, and is held sacred by the Hindus. There are several large towns on its banks.

GOGO, a sea-port of Hindustan, in the province of Gujrat, and district of Goelwarah, situated on the west side of the Gulf of Cambay. It is considered as a safe roadstead during the south-west monsoon, where ships may be supplied with stores and provisions, and repair any damage they may have sustained. The inhabitants, who are principally Mahommedans, build vessels of from fifty to three hundred tons burden; and carry on a considerable trade with Bombay and other places, the chief export being cotton. The Lascars of this place are named Siddhees; they are descendants of the Abyssinians, and are held in much estimation for their nautical skill and bravery. It is an ancient town, and has fallen greatly into decay; but since it came into the possession of the British it has been gradually increasing in commerce and population. Long. 72. 21. E. Lat. 21. 41. N.

GOGUET, ANTOINE-YVES, a distinguished French writer, was born at Paris on the 18th January 1716. From his infancy he was connected by the ties of friendship with Alexander Conrad Fugère, the learned editor of the *Journal des Savants;* and there never perhaps existed between two friends such an entire conformity of tastes and character. They studied philosophy together at the college of Harcourt, and after having terminated their studies there, both felt the necessity of recommencing them. To this laudable object they accordingly applied themselves with an ardour which was at length crowned with success. The former laboured without any other object than that of instructing himself; but the latter had a plan to which all his studies were directed. When Goguet undertook the work which distinguishes his name, Fugère assisted him with criticisms and materials. The success of this work was well deserved; and of the two friends, Fugère was the one whom that success flattered the most. Robust health appeared to promise long life to Goguet; and he had applied himself to new labours, when he was seized by the small-pox, a disease which he had always dreaded, but without deciding to have recourse to inoculation. He died on the 2d of May 1758, at the age of forty-two years and three months. By his will, he bequeathed his library to Fugère, but the latter was so deeply affected by the death of his friend, that he only survived him three days. This affecting incident is perhaps without a parallel in the history of friendship. The work of Goguet is entitled *De l'Origine des Lois, des Arts, et des Sciences, et des leur Progrès chez les anciens peuples*, Paris, 1758, in three volumes 4to. Of this valuable work there have been several editions; but the first is the best. An excellent translation of it was published at Edinburgh in 1761, in three volumes octavo. It is stated in the *Edinburgh Review* (vol. xiv. p. 409) as a fact "not generally known, that this translation came from the pen of Dr Henry, the historian of Great Britain." The period embraced in the work extends from the establishment of civil society to the reign of Cyrus. It is divided into three parts, and each into six books, which treat separately of government, the arts and manufactures, the sciences, commerce and navigation, the military art, and, lastly, manners and usages. The state of each of these objects of inquiry at different epochs is examined continuously; and facts, investigated with equal erudition and good faith, always serve as the basis of the reasonings. The style is agreeable, without, however, being exempt from some indications of bad taste. At the end of each volume are discussed, in learned dissertations, those points the detailed examination of which could not easily enter into the body of the work. Goguet intended to write a History of the Progress of Laws, Arts, and Sciences in France, since the establishment of the Monarchy; and it is much to be regretted that he did not live to carry into execution an undertaking which, proceeding from his pen, would have been invaluable. An *Eloge* of Goguet was printed in the *Année Littéraire*, 1758, tome iv., and in the supplement to the *Journal des Savants* for the month of July in the same year. (A.)

Gohud
||
Golconda.

GOHUD, a fortified town of Hindustan, in the province of Agra, and capital of an extensive district of the same name. The district is situated on the south side of the river Chumbul, and between the 26th and 27th degrees of north latitude. It is a mountainous territory, but is fertile in the valleys, and abounds with strong positions, particularly the celebrated fortress of Gualior. About the middle of the last century Gohud was a small village attached to the district of Gualior, and the rannah's ancestors were zemindars of this village. Bheem Singh, the rannah, prior to the battle of Paniput, in 1761 acquired possession of Gualior, but it was taken from him by the Mahrattas. When this nation lost the battle of Paniput, the rannah of Gohud attempted to shake off their yoke, but was conquered by Ragoonauth Row in 1766, and compelled to continue tributary. On a subsequent rupture Gohud was taken by Scindia in 1784. On the 17th of January 1804 a treaty was concluded by the British government with the rannah of Gohud, by which he was to be established in the sovereignty of Gohud, Gualior, and a considerable number of adjacent districts. This treaty, however, was never carried into effect, and a new treaty was concluded, by which the rajah agreed to relinquish the country and fort of Gohud, and the adjoining districts. Gohud is sixty-five miles south-west from the city of Agra. Long. 78. 21. E. Lat. 26. 21. N.

GOLCONDA, a strong fortress of Hindustan, situated on a hill about six miles west-north-west from Hyderabad, strongly defended both by nature and art, but being situated on a rock, is excessively hot and unhealthy. The principal inhabitants and bankers of Hyderabad are permitted to reside in this fort, to which they retire with their property on any alarm. It was once the capital of an extensive kingdom of native Hindu princes, and afterwards a principal division of the Bhamenee sovereignty, on the fall of which it again became the seat of a monarchy under the Cutub Shahee dynasty. It was taken by Aurungzebe by treachery in 1687, after a siege of seven months. In its vicinity are numerous handsome tombs.

GOLD, the most valuable of all the metals, is of a bright yellow colour when pure, but becomes more or less white in proportion as it is alloyed with other metals. It is the heaviest of all the metals, platina only excepted.

Native gold is found in veins, but these are seldom or never very large. It is generally very minutely disseminated, and can only be detected by washing the pulverized mineral strata in which it exists, such as the sand of rivers, and the mould of valleys and plains, whither it had been transported by running water. Gold is obtained from the alluvial soils of several islands in the Indian Ocean; from several parts of Africa, a part of which is called the Gold Coast, on account of the quantities of this metal formerly found there; from the sands of several European rivers, and also those of the United States: but by far the greatest quantity of gold is found in the South American mines. Humboldt estimates the average product of gold per annum, of South America and New Spain, at nearly 11,000,000 dollars. In Russia and the United States there are also mines of gold. Adding the produce of the American to that of the Russian mines, their total produce during each of the four decennial periods ending with the year 1829, has been estimated as follows by Macculloch, in his *Dictionary of Commerce* (p. 943):

Ten years ending	1799	L.3,295,000
....	1809	4,180,000
....	1819	3,955,000
....	1829	5,752,000

The gold produced in the United States in 1832 was in value above L.135,000. It is chiefly obtained by washing the soil in the valleys. The produce of the European mines of Hungary, Saxony, and other places, has been somewhat variously estimated; but it must be trifling compared with the quantities derived from the new world. With regard to the quantity of gold annually consumed, no correct idea can be formed, because it is utterly impossible to estimate how much of old gold is wrought up in the fabrication of new materials. As to the future supply of this precious metal, it seems probable that it will increase when the anarchy in which the South American states have been so long involved shall terminate.

Gold *Coast.* See Guinea.

Gold *Wire*, a cylindrical ingot of silver, superficially gilt or covered with gold at the fire, and afterwards drawn successively through a great number of little round holes, of a wire-drawing iron, each less than the other, until it attain the fineness required.

Gold *Wire flattened*, is the former wire flattened between two rollers of polished steel, to fit it to be spun on a stick, or to be used flat, without spinning, in certain stuffs, such as laces, embroideries, and the like.

Gold *Thread*, or *Spun Gold*, is flattened gold, wrapped or laid over a thread of silk, by twisting it with wheel and iron bobbins.

Gold *Leaf*, or *Beaten Gold*, is gold beaten with a hammer into exceedingly thin leaves, so that an ounce may be extended into one thousand six hundred leaves, each three inches square, in which state it covers more than 159,052 times its former surface.

Gold *Plates for Enamelling* are generally made of ducat gold, the fineness of which is from 23½ to 23¾ carats; and the finest gold is the best for this purpose, unless where some parts of the gold are left bare and unpolished, as in watch-cases, snuff-boxes, and the like, for which purpose a mixture of alloy is necessary, and silver is preferred to copper, because the latter disposes the plates to become tarnished and to turn green.

Shell Gold is that used by those employed in gilding and illuminating, and with which gold letters are written. It is made by grinding gold leaves, or gold-beaters' fragments, with a little honey, and afterwards separating the honey from the powdered gold by means of water. When the honey is washed away, the gold may be put on paper or kept in shells. When it is used it is commonly diluted with gum-water or soap-suds. The German gold powder, prepared in this manner from the Dutch gold leaf, is generally used; and when it is well scoured with varnish, it answers the end in japanners' gilding as well as the genuine.

Gold *Size*, for burnished gilding, is prepared of one pound and a half of tobacco-pipe clay, half an ounce of red chalk, a quarter of an ounce of black lead, forty drops of sweet oil, and three drams of pure tallow. Grind the clay, chalk, and black lead, separately, very fine, in water; then mix them together, add the oil and tallow, and then grind the mixture to a due consistence.

GOLDAP, a circle in the Prussian government of Gumbinnen, extending over 260 square miles, and containing 23,370 inhabitants. The capital is a city of the same name, which stands at the issue of a river out of a lake. It contains two Lutheran churches, and 3120 inhabitants. Long. 22. 12. 25. E. Lat. 54. 17. 35. N.

GOLDBERG, a circle of the Prussian government of Leignitz, in Silesia, extending over 220 square miles, and including two cities and eighty villages, with 38,900 inhabitants. The capital is a city of the same name, which stands on an elevation of 830 feet, at the foot of which is the river Katsbach. Near to it are mines of iron and manganese, and gold was formerly found. It is now a flourishing manufacturing place, with 6000 inhabitants, who produce cloths and flannels.

GOLDEN, something which has a relation to gold, or consists of gold.

Golden *Calf* was a figure of a calf, which the Israelites cast in gold, or some preparation of that metal, and set up in the wilderness to worship during Moses' absence in the mount; and which that legislator at his return burned, ground to powder, and mixed with the water the people were to drink.

Golden *Fleece*, in the ancient mythology, was the skin or fleece of the ram upon which Phryxus and Hella are supposed to have swum across the sea to Colchis, and which being sacrificed to Jupiter, was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept. The fleece was taken and carried off by Jason and the Argonauts.

Many authors have endeavoured to show that this fable is an allegorical representation of some real history, particularly of the philosopher's stone; whilst others have explained it by the profit of the wool trade to Colchis, or the gold which they commonly gathered there with fleeces in the rivers.

Order of the Golden *Fleece* is a military order instituted by Philip the Good, duke of Burgundy, in 1429. It took its denomination from a representation of the golden fleece, borne by the knights on their collars, which consisted of flints and steels.

Golden *Number*, in *Chronology*, a number showing what year of the moon's cycle any given year is. See Chronology.

Golden *Rule*, in *Arithmetic*, a rule or praxis, of great use and extent in the art of numbers, by which we find a fourth proportional to three quantities given. The golden rule is also called the *Rule of Three* and *Rule of Proportion.* See Arithmetic.

GOLDONI, Charles, the most celebrated comic writer of Italy in the eighteenth century, and in his own country styled the Italian Molière, was born at Venice in the year 1707, in which city his father acted in the capacity of

Goldoni.

physician. His attachment to the drama became conspicuous even in childhood, and this his father countenanced and cherished, by erecting a theatre in his own house, where young Goldoni and some of his companions were the actors. It is said that he even drew the outline of a comedy of his own invention when he was not more than eight years of age; a most extraordinary, though not very credible, indication of future eminence. He was taught rhetoric at Perugia, in the college of the Jesuits, and prosecuted his philosophical studies at Rimini. The stage, however, had too many attractions for him, to admit of his paying much attention to Aristotle or Quintilian, and he eloped from Rimini with a company of comedians, when they removed to Chiozza. His father attempted in vain to induce him to study either physic or the law; yet his ardent imagination was so forcibly struck with a particular ceremony of the church, that he conceived the intention of turning capuchin; but the dissipation of Venice soon extinguished this fancy. After the demise of his father he was prevailed upon by his surviving parent to engage in the profession of the law for immediate support; but some unknown causes induced him to leave the bar, after which he proceeded to Milan, and was there appointed secretary to the Venetian resident.

At Milan he brought out his first performance, under the title of *Il Gondoliere Veneziano*, which had all the success that could be expected from such a composition. He afterwards removed to Verona, where he joined himself to a company of players, and also entered into the state of wedlock. He composed a number of pieces for the company to which he attached himself, and amongst these his tragedy of Belisarius, which was performed for the first time at Venice on the 24th of November 1734, with the greatest success. Whilst as Venice he formed the laudable resolution of reforming the Italian stage, which at that time was disgraced by contemptible farce and low buffoonery. With this view, having made himself acquainted with the true nature of comedy, ne kept within the limits of nature and decorum; and such was the fertility of his genius, such his indefatigable industry, that he produced no fewer than sixteen comedies and forty-two other theatrical pieces in the course of about twelve months. Nor is it a less remarkable circumstance that some of these hasty performances are considered as his masterpieces. His works, in ten volumes 8vo, were first printed in 1753, and in 1761 his new pieces amounted to fifty-nine. And here ends the literary life of Goldoni in Italy; for about this time he accepted an engagement of two years in Paris, where he found a numerous company of excellent performers in the Italian theatre. His first attempt was unsuccessful, because he had to contend with the pantomimic drollery which was most agreeable to the depraved taste of the times. When about to leave Paris on the expiration of his engagement, he was introduced to the court, and appointed teacher of the Italian languages to the princesses. He had lodgings assigned him in Versailles, but his allowance was not sufficient to enable him to dispense with writing for the stage. Meanwhile, being anxious to show the French nation that he merited a high place among their dramatic writers, he neglected no means calculated to render him master of the French language; and, at the age of sixty-two, he ventured to write a comedy in French, which was brought out under the title of *Le Bourru Bienfaisant*, and received great applause in the court theatre. His next production was *L'Avare Fastueux*, also a comedy; and this was succeeded by *Volponi*, which he wrote after he had retired from court. The last work which he undertook was the *Mémoires pour servir à l'Histoire de sa Vie et à celle de son Théâtre*, which, after having been about three years occupied with the composition, appeared in 1787, when he entered into the eightieth year of his age. These Memoirs, written with unaffected simplicity and sincerity, display the real character both of the author and the man, and supply the most ample information respecting the history of his life. Deprived of his pension soon after the commencement of the revolution, Goldoni was reduced to absolute indigence, and passed the evening of his life in extreme distress. At length he fell sick; and it was only in his last moments, on the 7th of January 1793, that the Convention, apprised of his situation, decreed, on the report of Chenier, that his pension should in future be paid out of the national treasury, and that the arrears due to him should be immediately discharged. But it was too late. Goldoni died on the day after this decree was passed. But, on the recommendation of Chenier, a pension of 1200 francs was granted to his widow, aged seventy-six, and the arrears due to her husband were also paid to her. If the rapidity with which Goldoni composed prevented him from attaining the first rank as a comic writer, it will easily be conceded that he stands foremost in the second. His fertility is prodigious, and if his works betray marks of haste or of carelessness, they at least show ready invention, and, considering the diversity of his subjects, extraordinary resources as a comic writer. The greatest fault with which he is reproached is having contributed to corrupt the language of his country, which he seems to have been unable to write with purity, elegance, and propriety; and, in fact, we find ease, originality, and, if we may so express it, purity of style only in his comedies written in the Venetian dialect, which was his vernacular idiom. His merits are, having contributed to reform the Italian stage, supplanted farce and low buffoonery, naturalised genuine comedy in his native country, and replaced the extravagances which had so long corrupted the public taste, by pieces in which a regular plot and natural characters supply the place of nonsensical ribaldry and ridiculous exaggeration. His comic opera entitled *Buona Figliuola*, with music by Piccini, was the first production which introduced both the poet and the composer to the knowledge of our countrymen. The only complete edition of Goldoni's works is that printed at Leghorn, 1788, 1791, in thirty-one vols. 8vo.

GOLDSMITH, or, as some choose to express it, *silversmith*, an artist who makes vessels, utensils, and ornaments, in gold and silver.

The goldsmith's work is either performed in the mould, or beat out with the hammer or other instrument. All works which have raised figures are cast in a mould, and afterwards polished and finished; plates or dishes of silver or gold are beaten out from thin flat plates; and tankards, and other vessels of the kind, are formed of plates soldered together, their mouldings being beaten out, not cast. The business of the goldsmiths formerly required much more labour than it does at present; for they were then obliged to hammer the metal from the ingot to the thinness they wanted; but the flattening mills which have been latterly invented reduce metals to the thinness required, at a very moderate expense. The goldsmith makes his own moulds, and, for that reason, should be a good designer, and have a taste in sculpture; he ought also to know enough of metallurgy to be able to assay mixed metals, and to mix the alloy.

Goldsmith, *Oliver*, an eminent English poet and general writer, was born on the 29th of November 1728, at a place called Pallas, in the parish of Forney and county of Longford, in Ireland. His father, the Reverend Charles Goldsmith, was a clergyman of the established church, who had been educated at Dublin, and afterwards held the living of Kilkenny West, in the county of Westmeath. By his wife, Anne, daughter of the Reverend Mr Jones, master of the diocesan school of Elphin, he had five sons and two daughters. His eldest son Henry entered the church, and to him the Traveller is dedicated; the second was Oli-

Goldsmith.

very who is supposed to have faithfully represented his father in the character of the village preacher in the poem of the Deserted Village. Oliver was originally intended for some mercantile employment, and with this view he was instructed in reading, writing, and arithmetic, at a common school; but as he had shown an early predilection for poetry, and betrayed some inequalities of temper and conduct which seemed to indicate a disposition more favourable to the pursuits of genius than the regularity of business, he was put to a school of reputation to qualify him for entering the university with the advantage of suitable preparation. In June 1744, being then in his fifteenth year, he was entered as a sizer at Trinity College, Dublin; and in this seminary he continued a few years, when he took a bachelor's degree; but his brother not being able to obtain any preferment after he left the college, Oliver, by the advice of a relation, turned his thoughts to the study of physic; and after attending some courses of anatomy in Dublin, proceeded, in the year 1752, to Edinburgh, where he studied the several branches of medicine under the different professors in that university. But his thoughtless disposition soon involved him in difficulties; and he was obliged to leave Scotland precipitately, in consequence of engaging to pay a considerable sum of money for a fellow student. A few days afterwards, about the beginning of the year 1754, he arrived at Sunderland, near Newcastle, where he was arrested at the suit of a tailor in Edinburgh, to whom he had given security for his friend. But by the good offices of Mr Laughlan Maelane and Dr Sleigh, he was soon delivered out of the hands of the bailiff, and took his passage on board a Dutch ship to Rotterdam, where, after a short stay he proceeded to Brussels. He then visited the greater part of Flanders; and, after passing some time at Strasburg and Louvain, where he obtained the degree of bachelor of physic, he accompanied an English gentleman to Berne and Geneva, in Switzerland.

It is undoubted that this ingenious but unfortunate person travelled on foot during the greater part of his tour. He had left England with very little money; and being of a philosophical turn, and at that time possessing a body capable of sustaining every fatigue, and a heart not easily appalled at danger, he became an enthusiast in the design he had formed of seeing the manners of different countries. He had some knowledge of the French language and of music, and he played tolerably well on the German flute; which, from an amusement, became at some times his only means of subsistence. His learning produced him a hospitable reception at most of the religious houses; and his music made him welcome to the peasants of Flanders and other parts of Germany. "Whenever I approached a peasant's house towards night-fall," said he, "I played one of my most merry tunes, and that procured me not only a lodging, but subsistence for the next day; but in truth I must own, whenever I attempted to entertain persons of a higher rank, they always thought my performance odious, and never made me any return for my endeavours to please them."

On Goldsmith's arrival at Geneva, he was recommended as a proper person for a travelling tutor to a young man who had been unexpectedly left a considerable sum of money by his uncle, formerly an eminent pawnbroker near Holborn. This youth, who had been articled to an attorney, determined, on receipt of his fortune, to see the world; and, on his engaging with his preceptor, made a provision that he should be permitted to govern himself; but Goldsmith soon found his pupil understood extremely well the art of managing his money concerns, avarice being, in fact, his ruling passion. His questions were usually how money might be saved, which was the least expensive course of travelling, and whether any thing could be bought that would turn to account when disposed of again in London. Such curiosities on the way as could be seen for nothing he was ready enough to look at; but if the sight of them required to be paid for, he usually asserted that he had been told they were not worth seeing. A companion of this turn could not be much to Goldsmith's taste, and in truth must have been intolerable to any one. During his continuance in Switzerland he assiduously cultivated his poetical talent, of which he had given some proofs even whilst at Edinburgh. It was from this country that he sent the first sketch of his poem called the Traveller to his brother the clergyman in Ireland, who, giving up fame and fortune, had retired with an amiable wife, to happiness and obscurity, on an income of only L.40 a year. From Geneva Mr Goldsmith and his pupil visited the south of France, where the young man, upon some disagreement with his preceptor, paid him the small part of his salary which was due, and embarked at Marseilles for England. Our wanderer was thus left once more at large in the wide world, and passed through a variety of difficulties in traversing the greater part of France. At length his curiosity being satiated, he bent his course towards England, and arrived at Dover in the year 1756.

When he reached London, his stock of cash did not amount to a couple of shillings; and being an entire stranger in the metropolis, his mind was filled with the most gloomy reflections on his embarrassed situation. With some difficulty he discovered the part of the town in which his old acquaintance Dr Sleigh resided. This gentleman received him with the warmest affection, and liberally invited him to share his purse until some establishment could be procured for him. Unwilling, however, to be a burden to his friend, Goldsmith, a short time afterwards, embraced an offer which was made him to assist Dr Milner in instructing young gentlemen at an academy at Peckham; and for a short time he acquitted himself greatly to the doctor's satisfaction. But having obtained some reputation by some criticisms he had written in the Monthly Review, Mr Griffith, the proprietor, engaged him in the compilation of that work; and, resolving to pursue the profession of writing, he returned to London, as the mart where abilities of every kind were sure to meet distinction and reward. As his finances were by no means in a good state, he determined to adopt a plan of the strictest economy, and took lodgings in an obscure court in the Old Bailey, where he wrote several ingenious little pieces. Mr Newberry, who was at that time a great encourager of men of literary abilities, became a patron of our author, and introduced him as a writer in the Public Ledger, in which his Citizen of the World originally appeared, under the title of Chinese Letters.

Fortune now seemed to bestow some notice on a man whom she had long neglected. The simplicity of his character, the integrity of his heart, and the merit of his productions, made his company acceptable to a number of respectable families; and he emerged from his shabby apartments in the Old Bailey to the politer air of the Temple, where he took handsome chambers, and lived in a genteel style. The publication of his Traveller, and his Vicar of Wakefield, was followed by the performance of his comedy of the Good-Natured Man at Covent Garden Theatre; a production which placed him in the first rank of the poets of the age.

Amongst many persons of distinction who were desirous to know him was the Duke of Northumberland; and the circumstance which attended his introduction to that nobleman is worthy of being related, as showing a striking trait of his character. "I was invited," said the doctor, as he was then universally called, "by my friend Mr Percy, to wait upon the duke, in consequence of the satisfaction he had received from the perusal of one of my

Goldsmith.

productions. I dressed myself in the best manner I could, and, after studying some compliments I thought necessary on such an occasion, proceeded to Northumberland House, and acquainted the servants that I had particular business with his grace. They showed me into an antichamber; where, after waiting some time, a gentleman very genteelly dressed made his appearance. Taking him for the duke, I delivered all the fine things I had composed in order to compliment him on the honour he had done me; when, to my great astonishment, he told me I had mistaken him for his master, who would see me immediately. At that instant the duke came into the apartment, and I was so confused on the occasion, that I wanted words barely sufficient to express the sense I entertained of the duke's politeness, and went away extremely chagrined at the blunder I had committed." Absence, simplicity, credulity, and entire ignorance of the world, appear to have formed the principal elements in the character of this amiable but somewhat eccentric man of genius. He was indeed "in wit a man, simplicity a child."

Previously to the publication of his Deserted Village, the bookseller had given him a note for a hundred guineas for the copyright, which the doctor mentioned a few hours afterwards to one of his friends, who observed, it was a very great sum for so short a performance. "In truth," replied Goldsmith, "I think so too; I have not been easy since I received it, therefore I will go back and return him his note." This he absolutely did, and left it entirely to the bookseller to pay him according to the profits produced by the sale of the piece, which, however, proved to be very considerable.

During the last rehearsal of his comedy entitled She Stoops to Conquer, which Coleman had no opinion would succeed, on the doctor's objecting to the repetition of one of Tony Lumpkin's speeches, being apprehensive it might injure the play, the manager with great keenness replied, "Psha, my dear doctor, do not be fearful of squibs, when we have been sitting almost these two hours upon a barrel of gunpowder." The piece, however, contrary to Coleman's expectation, was received with uncommon applause by the audience; and Goldsmith's pride was so much hurt by the severity of this observation, that it entirely put an end to his friendship for Coleman.

Notwithstanding the great success of his pieces, by some of which, it has been asserted on good authority, he cleared L.1800 in one year, his circumstances were by no means in a prosperous condition. This was partly owing to the liberality of his disposition, and partly to an unfortunate habit he had contracted of gaming, the arts of which he knew very little of, and consequently became the prey of those who were unprincipled enough to take advantage of his simplicity.

Just before his death he had formed a design of executing an Universal Dictionary of Arts and Sciences, the prospectus of which he actually published. In this work several of his literary friends, particularly Sir Joshua Reynolds, Dr Johnson, Mr Beauclerc, and Mr Garrick, had undertaken to furnish him with articles upon different subjects; and he entertained the most sanguine expectations of its success. The undertaking, however, did not meet with that encouragement from the booksellers which he had imagined it would undoubtedly receive; and he used to lament this circumstance almost to the last hour of his existence.

He had been for some years afflicted, at different times, with a violent strangury, which contributed not a little to embitter the latter part of his life; and which, united with the vexations he suffered on other accounts, brought on a kind of habitual despondency. In this unhappy condition he was attacked by a nervous fever, which, being improperly treated, terminated his existence on the 4th of April 1774, at the age of forty-five.

Golf
Golius.

The learned leisure which he loved to enjoy was too often interrupted by distresses which arose from the liberality of his temper, and which sometimes threw him into loud fits of passion. But this impetuosity was corrected upon a moment's reflection; and his servants have been known upon these occasions purposely to throw themselves in his way, that they might profit by it immediately afterwards; for he who had the good fortune to be reproved was certain of being rewarded for it. The universal esteem in which his poems were held, and the neverfailing pleasure which they afford in the perusal, are striking proofs of their merit. He was a studious and correct observer of nature; happy in the selection of his images, the choice of his subjects, and the harmony of his versification; and though his embarrassed situation prevented him from putting the last hand to many of his productions, his Hermit, his Traveller, and his Deserted Village, bid fair to retain their place amongst the most finished pieces in the English language.

Besides the works already mentioned, he wrote, 1. History of the Earth and Animated Nature, in 6 vols. 8vo; 2. History of England, in 4 vols. 8vo; 3. History of Rome, in 2 vols.; and, 4. Abridgments of the two last, for the use of schools. Goldsmith's Miscellaneous Works were collected and published by Bishop Percy, who prefixed to his edition a valuable and interesting life of the author.

GOLF, the name of a certain game amongst the Scotch, and said to be peculiar to their country. Amongst this people it has been very ancient; for there are statutes prohibiting it as early as the year 1457, lest it should interfere with the sport of archery. It is commonly played on rugged or broken ground, covered with short grass, in the neighbourhood of the sea shore. A field of this sort is in Scotland called *links*. The game is generally played in parties of one or two on each side. Each party has an exceedingly hard ball, somewhat larger than a pullet's egg; and this they strike with a slender and elastic club, of about four feet in length, crooked in the head, and having lead run into it to make it heavy. The ball being struck with this club, flies sometimes to the distance of two hundred yards, and the game is gained by the party who puts his ball into the hole with the fewest strokes. But the game does not depend solely upon striking the longest ball, but also upon measuring the strength of the stroke, and applying it in such direction as to lay the ball in smooth ground, whence it may easily be moved at the next stroke. To encourage this amusement, the city of Edinburgh, in the year 1744, gave to the company of golfers a silver club, to be played for annually by the company, the victor to append a gold or silver piece to the prize. For their better accommodation, twenty-two members of the company, in the year 1768, subscribed L.30 each to build a house where their meetings might be held. The spot chosen for this purpose was the southwest corner of Leith Links, where an area was taken in feu from the magistrates of Edinburgh, and a house and tavern built upon it. St Andrews has long been celebrated for the game of golf.

GOLIUS, James, a professor of Arabic and mathematics at Leyden, was descended from a considerable family of the same name, and born at the Hague in the year 1596. He was early sent to the university of Leyden, where he studied under Erpenius; and having made himself master of the learned languages, applied himself to the study of mathematics, physic, and divinity. He afterwards travelled into Africa and Asia; and was greatly esteemed both by the king of Morocco and the sultan of Turkey. He at length returned to Leyden loaded with manuscripts; and in 1624 succeeded Erpenius in the Arabic chair. As he had been an eye-witness of the wretched state of Christianity in the Mahommedan countries, he was filled with the compassion of a fellow Christian; and none ever solicited for a place of honour and profit with greater eagerness than he did for procuring a new edition of the New Testament, in the original language, with a translation into the modern Greek by an archimandrite; and as there are some of these Christians who use the Arabic tongue in divine service, he also caused to be dispersed amongst them an Arabic translation of the confession of the Protestants, together with the Catechism and Liturgy. In 1626 he was chosen professor of mathematics, and discharged the functions of both professorships with the greatest applause during forty years. He was likewise appointed interpreter in ordinary to the states for the Arabic, Turkish, Persian, and other eastern languages, and had an annual pension conferred upon him, together with a present of a gold chain and a beautiful medal, which he wore as a badge of his office. Although entitled to be considered as an universal scholar, Golius excelled chiefly in philology and languages, in the acquisition of which he evinced equal ability and application. At the age of fifty-four he made himself master of Persian, in which he wrote a dictionary, afterwards printed in Castell's *Lexicon Heptaglotton;* he was intimately acquainted with the Turkish; and he had made such progress in the Chinese that, though he applied late in life to the study of it, he was able to read and understand books written in that language. Besides the works which he had printed and published, he left several unfinished manuscripts, which, if he had lived to complete them, would have done credit to his talents and learning. His published works are, 1. *Chadzrat-aladab min kelam alarab*, hoc est, Proverbia quædam Alis Imperatoris Muslemici, et Carmen Tograï poëtæ doctissimi, necnon Dissertatio quædam Aben-Synæ, Leyden, 1629, in 8vo; 2. Lexicon Arabico-Latinum, contextum ex probatioribus Orientis lexicographis: accedit index copiosissimus, qui Lexici Latino-Arabici vicem explere possit, Leyden, 1653, in folio; 3. Muhamedis filii Ketiri Ferganensis, qui vulgo Alfraganus dicitur, elementa Astronomica Arabice et Latine, cum notis ad res exoticas sive Orientales, quæ in iis occurrunt, Amsterdam, 1669, in 4to; 4. Ahmedis Arabsiadæ vitæ, et rerum gestarum Timuri qui vulgo Tamerlanes dicitur, Historia, Leyden, 1636, in 4to; 5. An edition of the Arabian Grammar of Erpenius, to which Golius added, Adagiorum Arab. centuriæ iii. Poetarum sententiæ lix. Consessus i. Haririi, Carmen Abu-Olæ, and Patriarchæ Antioch. Eliæ iii. qui floruit circa annum Christi 1180, homilia de nativ. Christi; 6. Dictionarium Persico-Latinum, left in manuscript at his death, and published, as already mentioned, in Castell's *Lexicon Heptaglotton*. Golius died on the 28th of September 1667.

GOLTZIUS, Henry, a celebrated engraver and painter, was born in 1558, at Mulbreck, in the duchy of Juliers. He was taught engraving by Theodore Cuerenhert, and succeeded well in the practice of the art, notwithstanding the disadvantage of a lame hand, which was occasioned by his falling into the fire whilst young. He was first employed by his master, and afterwards he worked for Philip Galle. Domestic troubles and ill health having induced him to travel, he went through Germany into Italy; and passed under a feigned name, that his studies might not be interrupted. He visited Bologna, Florence, Naples and Venice, constantly applying himself to drawing from the antique statues, and studying the works of the great masters. At Rome he resided longest; and in that city he produced several excellent engravings from Polidore, Raphael, and other eminent painters. On his return to his native country he established himself at Haerlem, where he engraved many of the drawings which he had made during his abode in Italy. He died at Haerlem in 1617, aged fifty-nine.

GOMBROON, a celebrated sea-port of Persia, in the province of Laristan, situated in a barren country on a bay of the Gulf of Ormus. This was at one time the first sea-port in the kingdom of Persia, being the port of Shiraz, and of all the southern provinces; and it was at that time strongly fortified. The houses were large and handsome, but the place was considered very unhealthy. Gombroon is still a place of considerable trade. The customs amount to about 20,000 rupees a year, for which the imaum of Muskat, to whom the town is subject, accounts to the kings of Persia. The town is large, and the houses are built in a much more commodious manner than is usual in the towns of Persia. The fort of Minab, by which the town is defended, is divided into the upper, centre, and lower forts. Close to the fort a small river breaks through the hills, and forms a pass from the eastward. This river, together with the canals made to diffuse its waters, serve as ditches to the fort. The country for forty-five miles around Minab is covered with villages, abounds in dates, and supplies all the neighbouring country with grain. Forage is so plentiful that the cattle of the adjoining districts are sent in great numbers to feed there during the hot season. The English obtained permission to settle a factory here in 1613. About 1620 the Dutch obtained the same privilege; and when Ormus was captured in 1622, by the English and Persians, merchants resorted thither in great numbers, and commerce greatly increased The English remained here till 1759, when the factory, defenceless and totally neglected, was attacked by the French under Count d'Estaing, to whom it surrendered. The factory was afterwards re-established, but has long since been withdrawn, in consequence of the unhealthiness of the climate. Long. 56. 12. E. Lat. 27. 18. N.

GOMERSALL, a township of Yorkshire, within the parish of Birstall, in the wapentake of Morley, in the west riding of Yorkshire. The woollen manufactory employs the greater part of the inhabitants, who in 1801 amounted to 4309, in 1811 to 5902, in 1821 to 5952, and in 1831 to 6189.

GOMOR, a circle of the Hungarian province of the Hither Theiss, extending over 1596 square miles, and comprehending a city, twelve market-towns, and two hundred and sixty villages, with 164,000 inhabitants. It is the most mountainous portion of Hungary, and includes part of the Carpathian range. It contains many mines, and the metals obtained from these give occupation to the people, who apply them to making hardware. The climate is cold and raw, but the soil produces flax, tobacco, and some corn, abundance of cattle, and some butter and cheese. Linen goods are manufactured to some extent. The capital is a small town of the same name, where the Lutherans have a college with a good library.

GOMORRAH, one of the cities of the plain or of the vale of Siddim, in Judæa, destroyed together with Sodom by fire from heaven, on account of the wickedness of the inhabitants.

GONDAR, the capital of Abyssinia, situated, according to Mr Bruce's observations, in latitude 12. 30. north, and longitude 57. 40. east from Greenwich. See Abyssinia.

GONDI. See Retz, Cardinal de.

GONDOLA, a flat boat, very long and narrow, and chiefly used at Venice for rowing on the canals. The word is Italian, *gondola*. Du Cange derives it from the modern Greek κουντελας, a *bark* or *little ship;* but Lancelot deduces it from γονδυ, a term in Athenæus for a sort of vase.

GONIEH, a fortified town on the coast of the Black Sea, on the south of the Phasis, and which, though properly forming part of Georgia, is almost entirely dependent on the Turkish government. It was formerly a considerable place, but is now sunk into a miserable village. It is 80 miles east-north-east of Trebisond.

GONONG APEE, one of the smaller Banda Islands, at the north-east end of the harbour of Beema, in the island of Sumbawa, and forming the west side of the north entrance of Sapy Straits. It derives its name from a large volcano about 1500 feet in height, and which terminates in two high peaks, and constantly emits smoke and ashes. It is separated from Neira by a narrow strait, and at a distance has the appearance of a heap of cinders. On the south side of the island are two forts, originally intended to defend the west channel of Lantore harbour; but owing to the eruption of the volcano in 1778, the lava flowed down in such quantities as to render them in a great degree useless.

GONONG TELLOO, a town in the island of Celebes, situated on a river of the same name, two miles from the sea, on the north side of the great bay of Tominie or Gonong Telloo, which stretches inland nearly to the west side of Celebes. It was subject to the Dutch, who had a considerable fort on the river, with two small ones at its entrance, but it was reduced when the island of Celebes was taken possession of by the British in 1812. Ships can anchor at the entrance of the river in deep water; and just within the entrance are two small coves, either of which a ship may haul into, and be sheltered from the strong freshes that come down the river. The inhabitants are Malays and Mahommedans. A considerable trade is carried on, and the rajah is the principal merchant. The articles chiefly imported are opium, iron, gunpowder, piece-goods of a common kind, and coarse cutlery. Gold is one of the principal exports, and also tortoise-shell; the gold is procured from a mine to the westward of Gonong Telloo. Long. 123. E. Lat. 0. 30. S.

GONIOMETRY, a method of measuring angles, so called by M. de Lagny, who published several papers on this method in the Memoirs of the Academy of Sciences in the years 1724, 1725, 1729. M. de Lagny's method of goniometry consists in measuring the angles with a pair of compasses, and that without any scale whatsoever, except an undivided semicircle. Thus, having any angle drawn upon paper to be measured, produce one of the sides of the angle backwards behind the angular point; then with a pair of fine compasses describe a pretty large semicircle from the angular point as a centre, cutting the sides of the proposed angle, which will intercept a part of the semicircle. Take this intercepted part exactly between the points of the compasses, and turn them successively over upon the arc of the semicircle, to find how often it is contained in it; and as after this there is commonly some remainder, take such remainder in the compasses, and in like manner find how often it is contained in the last of the integral parts of the first arc; and if there be again some remainder, find in like manner how often this last is contained in the former; and so on continually, till the remainder become too small to be taken and applied as a measure. By this means may be obtained a series of quotients, or fractional parts, one of another, which being properly reduced into one fraction, give the ratio of the first arc to the semicircle, or of the proposed angle to two right angles, or a hundred and eighty degrees, and consequently that angle itself in degrees and minutes.

GONORRHŒA, an efflux of matter from the urethra, most commonly owing to venereal infection.

GOOCHNAUTH, a village of Hindustan, in the province of Gujrat and district of Werrear, situated on the south bank of the Bunass river about three miles south-east from Rahdunpoor. The neighbouring country is in a state of high cultivation, and most of the fields are enclosed. It belongs to a Mahommedan chief.

GOOD, in general, whatever is apt to increase pleasure, to diminish pain; or, which amounts to the same thing, whatever is calculated to procure or preserve to us the possession of agreeable sensations, and remove those of an opposite nature. See MORAL PHILOSOPHY.

GOOD'S *Island*, an island on the north coast of New Holland, in Torres Strait, about two miles in length. It has a rocky soil, and is hilly and covered with wood. It abounds in a species of silk cotton plant. Long. 142. 10. E. Lat. 10. 32. S.

GOOD *Fortune*, or *Poro*, an island in the Eastern Seas, near the west coast of Sumatra, about thirty-six miles in length and six in breadth. Long. 98. 30. E. Lat. 1. 5. S.

GOOD *Friday*, a fast of the Christian church, in memory of the sufferings and death of Jesus Christ. It is observed on the Friday in holy or passion week; and it is called, by way of eminence, *good*, because of the blessed effects of our Saviour's sufferings, which were a propitiatory or expiating sacrifice for the sins of the world. The commemoration of our Saviour's sufferings has been observed from the very first ages of Christianity, and was always kept as a day of the strictest fasting and humiliation. Amongst the Saxons it was called *Long Friday*, but for what reason, except perhaps the long fastings and offices then used, is uncertain.

GOOD HOPE, CAPE OF, a district of country in the southern portion of Africa, in the possession of Great Britain. In the distribution of land and water, this cape occupies a conspicuous place on the map of the globe. It separates the Indian Ocean from the Atlantic, and divides the voyage to Hindustan into two nearly equal portions. To double this Cape, and bear across the ocean to the golden shores of India, was an object of ambition to the early Portuguese navigators. It was first descried, in 1493, by Diaz, who commanded a Portuguese squadron. (See GAMA.) The tempestuous nature of the sea, however, caused by the conflict of contending oceans running in opposite directions, compelled the navigator to return. By him the newly discovered land was called the Cape of Tempests; but the king of Portugal gave it the more auspicious name which it still bears. The formidable barrier, however, was not passed until 1497, when the celebrated Vasco de Gama, with his characteristic boldness, surmounted every difficulty, and carried the Portuguese flag into the Indian Sea. The Portuguese, however, found a richer spoil in the kingdoms of the East; and although they frequently touched at the Cape, they did not make any permanent settlement there. But the Dutch early saw the importance of forming a station at the Cape, and fixed upon it as a place where their vessels might take in water and provisions. But they did not, properly speaking, colonize it, until the middle of the seventeenth century, when they founded Cape Town. This led to further improvements, and the colony gradually assumed its present dimensions. The natives were either compelled to fly beyond the mountains, or they were reduced to a state of abject slavery. During the war with revolutionary France, the Cape was reduced by the British in 1797, but was ceded to Holland by the peace of Amiens. When the war recommenced, it again yielded to Britain, and the permanent possession of it was confirmed by the congress of Vienna in 1815.

This colony is bounded on the north and east by the Orange and Fish Rivers, and on the west and south by the Atlantic and Southern Oceans. The country extends from latitude 26. to 33. 55. 40. south. It includes the country inhabited by the Hottentot race and the Boshuanas. The country upon the map presents a very irregular figure; but Mr Barrow, reducing it to a parallelogram, computed that the Cape Colony comprehended an area of at least 120,000 square miles. Of this great tract of territory, a very considerable proportion is a sterile waste.

Chains of vast and barren mountains enclose level plains composed of a hard surface of clay, thinly sprinkled over with sand, and producing straggling tufts of stunted shrubs. The mountains generally extend in the direction of east and west, but there are exceptions to this rule.

The first great chain of mountains, which runs east and west, is called Lange Kloof or Long Pass. Between it and the southern coast there lies an irregular belt of land from twenty to sixty miles in width. It is indented by several bays, and, possessing a good soil and a more mild and equable temperature than the interior parts of the colony, it is well clothed with vegetation, and is in many parts wooded with forest trees. The next great chain is the Swartebergen, or Black Mountains. It is more lofty and rugged than the first, and in many places consists of double, and sometimes treble ranges of hills. Between it and the first chain there lies a belt which is about the mean width of that between the first and the sea. Its surface is very various, being composed in some parts of barren hills; in others of arid tracts of clay land called karroo; and in some places of fertile land. This belt lies higher than the first; but the temperature is less uniform, and altogether it is not so valuable as the other. The third great range is the Nieuweveld Mountains, which, with the second, encloses the Great Karroo,[1] an arid plain 309 miles in length, and eighty in breadth. This desert, which forms the third step or terrace of Southern Africa, is greatly elevated above the second. It is destitute of inhabitants, and almost of vegetation. What there is of the latter is parched and shrivelled by the heat of the sun, and from the want of moisture. On the western coast are also elevated chains of mountains. To the northward the country is more barren and sandy than towards the eastward. Sandstone resting upon a base of granite composes all the continuous chains of mountains in Southern Africa. These are the most prevailing rocks; the next in frequency are clay-slate, and there are also greywacke, quartz rock, and dolerite. In some parts the sandstone is traversed by veins of red iron ore. Dr Clarke Abel mentions a vein six feet wide, and extending for upwards of a hundred feet.

On the western coast there are two principal rivers, the Berg or Mountain River, which falls into St Helena Bay, and the Olifant or Elephant's River, which falls into the Southern Atlantic in south latitude 31. 30. Both these rivers have obstructions at their mouths, which prevent their being navigable. On the south coast are several considerable rivers, one of which is the Great Fish River. All these streams are well stocked with various kinds of fish. Breede or Braad River is navigable by ships of 200 tons burden, and its mouth has been called Port Beaufort. Here the exports of the district are made. The Grautz is the next great river of the coast. It is a collection of waters from the Great Karroo, the Black Mountains, and the maritime chain. The other streams it is unnecessary to mention. Southern Africa possesses but few lakes, and of these some are salt. There is also a paucity of springs; and although much rain falls in Cape District, it affords comparatively few, on account of the peculiar nature and relative position of the strata.

Cape Colony is divided into two provinces, the eastern and western, which are again subdivided into districts, arranged as under:

Western Province.—Cape District, Stellenbosch, Caledon, Zwellendam, Worcester (formerly Julbach), Clanwilliam.

Eastern Province.—Graaff Reynet, Beaufort, Somerset, Albany, Uitenhage, George, Fredericksburg.

It is to be observed that some of these districts have been united into one, since the commissioners of inquiry into the state of the colony suggested the propriety of dividing Cape Colony into two provinces. Although they are of nearly equal superficial extent, in their physical character and productions they are very unlike. The western districts produce chiefly corn and wine, and the eastern are principally adapted for pasturage.

Cape District is the most populous and prosperous of the whole. It consists of two parts; the peninsula on which the town stands, and the slip of land extending from the shore of Table Bay to the mouth of Berg River, and separated from Stellenbosch and Drakenstein by the Little Salt River, Deep River, and Mossel Bank River. This is about eighty miles from north to south, and twenty-five from east to west; whilst the Cape Peninsula is about thirty miles in length and eight in breadth. Both comprehend a surface of about 2240 square miles, and contain a population of 7462 souls, exclusively of the capital.

Cape Peninsula is distinguished for the richness and variety of its vegetable productions. Some of the finest botanical specimens which now adorn the gardens of Europe have been derived from this quarter of the world. In no other place do the bulbous plants in particular exhibit so many beautiful varieties. Others of the vegetable tribes, which are rather for ornament than use, are likewise numerous and beautiful; but there is a deficiency of building timber and fire wood, although forests of oak are said to exist to the east of False Bay, in that part called Hottentot Land. Many European plants have been introduced, as the vines of France, and the fruits of the north of Europe; and it is believed that the tea of China, the coffee of Java, the cotton of India, and the tobacco of America, as well as other valuable vegetable productions, might be successfully cultivated at the Cape. Of metals, copper, native iron, silver, and lead, are known to exist, and coal is said to have been discovered. This would no doubt be an invaluable acquisition to the natural wealth of the Cape; but at present the staple commodities upon which the colony depends are the produce of the wine districts; grain, hides, and skins; horses, argol, aloes, and wool. Perhaps silk might be made a source of colonial revenue, for here the mulberry grows to perfection, and the climate is precisely adapted to the worm. With regard to the zoology of the Cape of Good Hope, as there is little peculiar to this part of Southern Africa, and as under the head of Africa sufficient details are given, it is unnecessary to recapitulate what will be found in that article. We shall commence our topographical descriptions with the seat of government, Cape Town.

Cape Town, the capital of the colony, lies at the bottom of Table Bay, about thirty-two miles north from the Cape of Good Hope, and on the western side of the territory to which it gives its name, in longitude 18. 21. E. and latitude 33. 55. 56. S. The town, as we have already mentioned, was founded by the Dutch in 1650, after which it shared in the various vicissitudes which were experienced by the colony. The streets are regularly laid out in straight lines, crossing each other at right angles. Though unpaved, they are kept in excellent order, many of them being watered by canals, and planted on each side with oaks. The houses are built of brick, and faced with a stucco of lime, and they are decorated with cornices and architectural devices. Each house has in front a paved platform, called the stoep or step, usually eight or ten feet wide, and raised from two to four feet above the level of the street. It is here that the inhabitants retire to enjoy the air, or the converse of friends. The roofs have only an inclination sufficient to allow the rain to run down. Although the houses do not display the luxury and splendour of European man-

[1] The word *karroo* belongs to the Hottentot language, and signifies dry or arid.

Cape of Good Hope.

sions, they are nevertheless commodious and comfortable. There are three churches here, one for the Reformed or Calvinistic congregation, the established church of the Dutch government; one for the performance of the English service, built in 1820; and a third belonging to the Lutherans, who are a numerous body. Besides these, there is a meeting-house open to preachers of various denominations; and the Malays have a place of worship, in which the Mahommedan service is performed. The public buildings of Cape Town are, the government-house, which stands in a garden surrounded with plantations; the burgher senate-house, a large handsome building, where civic business is transacted, and which stands on one side of a square, where a market for vegetables is held; the commercial exchange, a building which contains the court of justice, the secretary's office, and most of the principal public offices; the custom-house, and other public buildings, such as are necessary in conducting the affairs of a large town. It is defended by a castle of considerable strength, which commands the jetty or landing place, and part of Table Bay, and completely controls the only road between the town and country. Table Bay is capable of containing any number of ships; but it is exposed to the westerly winds during the months of June, July, and August, during which there is thrown in a heavy swell, which often proves very destructive. This is the great drawback upon Cape Town, otherwise so admirably adapted for a commercial station. During the prevalence of the easterly monsoon, however, Table Bay is perfectly safe; whilst the cheapness of provisions, the healthiness of the climate, and, above all, its position, render it an excellent resting place for vessels bound to or returning from India, China, Australia, and other places.

Large quantities of corn of a very good description are produced in the immediate neighbourhood of Cape Town; but its free exportation is restrained, none being allowed to be sent abroad, except a specified quantity decided upon by government after an investigation into the state of the crops. Large quantities of wine, and of what is called brandy, are produced at the Cape; but, with the exception of Constantia, they are very inferior. Considerable quantities of hides, skins, and horns, are exported. They are principally brought from Algoa Bay, on the eastern side of the colony; and the trade has increased very fast during the last six or seven years. Horses, butter, beef, ivory, whale oil, aloes, argol, and various other articles, are among the exports. The imports at the Cape consist of woollens, cottons, hardware, earthen ware, furniture, haberdashery, soap, paper, books, and portions of most articles used in this country. Piece-goods and teak timber are imported from India, tea from China, sugar from India and the Mauritius, &c. The total revenue of the Cape Colony for the year 1832 amounted to L.130,808. 7s. 3½d.; the expenditure for the same year was L.126,889. 0s. 9¾d; leaving a balance or surplus of L.3919. 6s. 10¾d. The trade between the colonists and the independent natives is subjected to restraints, which do not work advantageously. According to the accounts published by the board of trade, the values of the products imported into and exported from the Cape of Good Hope in 1831 were as under.

Countries.	Imports.	Exports.
Great Britain	L.281,445	L.127,468
British colonies	37,751	70,957
Foreign states	25,855	14,700
	L.345,051	L.213,125

During the same year, the ships and tonnage entering inwards from, and clearing outwards to, the under-mentioned countries, were—

Countries.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
Britain	79	20,737	104	33,393

The whites are composed of individuals from various uropean nations. The most numerous of the inhabitants e the Dutch, who still occupy places of importance. The ves are for the most part Malays, or natives of Madagasr and the eastern coast. The Hottentots prefer a couny life, and are generally averse to residing in towns. In gard to the society of Cape Town, Mr Thomson observes, Of the habits and customs of the Cape Dutch in Cape own and its vicinity, I need only say, that they are beming every day more decidedly English. It will be a atter of regret, if they ever so entirely change as to lose me of their present character. They are a frank and spitable, and at the same time a prudent and thrifty ce."[1] The old Dutch court of justice, which till within ew years administered the law, has been superseded by court more on the English model, consisting of a chief stice and three puisne judges, with an attorney general, . instead of the old fiscal. Landrosts and humraden have en supplanted by civil commissioners, resident magistes, and justices of peace. A council has been appoint- to assist the governor with its advice, and consists of e chief justice, the government secretary, the military icer next in command to the governor for the time beg, the accountant general, and the chief commissioner of e eastern province. But the most important of all is, order in council, by which the Hottentots and other e coloured population are placed under the equal proction of the laws, and declared to be, as subjects of the itish government, in every respect upon the same footg as the white colonists, whether Dutch or English.

Cape of Good Hope.

A minute topographical description of the extended and thinly-peopled territory comprehended within the Cape Colony is unnecessary. A few particular places, however, may be described. In the vicinity of the capital there is a very conspicuous mountain called Table Mountain, which rises to the height of 3582 feet above the level of the sea. It commands a view of vast extent, and its sides afford a rich treat to the botanist and geologist. In the same peninsula on which the above mountain stands, are two others nearly as conspicuous and interesting. One of them is termed the Lion's Head, and has an elevation of 2160 feet above the level of the sea; the other is denominated the Lion's Rump, and its height is 1142 feet. About seventy-five miles from Cape Town, in the direction of south-east by east, are the warm baths of Swarteberg. To the north of these is the Guadenthal, or Bavian's Mountain, where the Moravian missionaries have their principal settlement. The members of this religious colony have been highly useful to the poor proscribed Hottentots. Near Algoa Bay, and 450 miles eastward of Cape Town, is situated Bethelsdorp, the principal establishment of the London Missionary Society. Those who have visited this place describe its outward appearance as being far from prepossessing. The country around is bleak and barren, and wants water for irrigation. However, many of the Hottentot families occupy substantial and commodious houses, whilst some have reached a degree of comfort and convenience far above the average of the frontier boors. The manufactures of England are used as clothing; many native artificers are to be met with; and, altogether, from the aspect of intelligence which the inhabitants exhibit, as described by the most recent travellers, there is no room to doubt that they are rapidly rising in the scale of society. There are a number of other missionary stations scattered throughout Cape Colony, and they all appear to have done, and to be still doing some good.

In 1820 a company of Scottish emigrants to the number of 5000, under the patronage of the British government, planted a colony in the district of Albany, on the frontiers of Caffreland, and conferred on it the name of Glen-Lynden. The late Mr Pringle, who headed the party, thus speaks of the settlement in 1834: "A few words in conclusion about our settlement of Glen-Lynden. Under the blessing of Providence its prosperity has been steadily progressive.........Without having any pretensions to wealth, and with very little *money* among them, the Glen-Lynden settlers, with some few exceptions, may be said to be in a thriving, and, on the whole, in a very enviable condition." This puts down at once the assertions which have been made in various publications, that the attempt had proved unsuccessful. It is impossible to calculate the benefits which may result from the enterprise of the intrepid Scottish emigrants. Keeping out of view entirely the moral effects which must result from their intercourse with the rude tribes around them, science seems likely to be greatly benefited by this colony. The number of the settlers has very much increased, and by their gradual diffusion over this vast continent, they may yet be the first to convey to us information respecting the interior of Africa, all attempts to explore which have hitherto proved equally fruitless and fatal.

The past history of the native races of Cape Colony, since the latter became known to Europeans, presents nothing but a dark picture of fierce tyranny on the one side, and gloomy submission on the other. Their domestic feuds also have tended greatly to enhance their miseries. The condition of the Hottentot is still very abject,

[1] Thomson's *Travels in South Africa*, vol. ii. p. 423.

Cape of Good Hope.

on account of the oppression of the district authorities, although the missionaries have done much to alleviate it. But we cannot enter into details relative to the conflict which was carried on between interested rapacity on the one hand, and Christian philanthropy on the other. Ample information upon this subject will be found in Dr Phillips' *Researches in South Africa.* A late writer thus describes the personal appearance and general character of the Hottentots.

"This unfortunate tribe has become noted and almost proverbial for presenting man in his lowest estate, and under the closest alliance with the inferior orders of creation. It must, indeed, be admitted, that they take particular pains to render their external appearance the most hideous that the human body can possibly present. Grease is poured over their persons in copious streams, which, being exposed to the perpetual action of smoke, forms on their skin a black and shining cake, through which the native colour, a yellowish brown, is scarcely ever perceptible. Grease in Africa forms the chief distinction of rank,—the rich besmearing themselves with fresh butter, while the poorer classes are obliged to tear the fat from the bowels of slaughtered animals. They assign as a reason for this singular practice an effect which has been readily admitted by judicious travellers, namely, that such a coating has in this climate a most salutary influence in defending them from the rays of the sun, and in averting many cutaneous disorders. Nature seems to have aided the task of disfiguring them, by covering the head with irregular tufts of hard and coarse hair, and causing singular prominences, composed of fat, to jut out in parts where they are least ornamental. Nor do their habits of life present any thing to redeem this outward deformity. Their kraals consist of a confused crowd of little conical hovels, composed of twigs and earth, in which large families sit and sleep, without having room to stand upright. The fire in the middle fills these mansions with thick smoke, the floors of which are deeply covered with every species of filth. At festivals, when an ox or a sheep is killed, the Hottentots rip open the belly, tear out the entrails, which they throw on the coals, and feast on them before the animal is completely dead. Yet they are a friendly, merry, hospitable race, living together in the greatest affection and harmony. The sluggish and senseless stupidity with which they have been so generally taxed, seems to have been in a great measure produced by their degrading subjection to the Dutch boors. In their free state they had a republican form of polity, and *konquers* or captains of the kraal, who led them to war, which they carried on with extreme fury. This commander usually sounded a pipe or flageolet, during which his men fought without intermission; but as soon as the music ceased they began to retreat. The Hottentots direct their darts and throwing-sticks with a sure aim, surround and attack wild animals with skill and vigour, and evade their springs with a dexterity which no European can equal. They tan, dress, and shape skins; make mats of flags and bulrushes; also twist strings for their bows out of the sinews of animals; and even mould iron into cutting instruments with considerable expertness. In their free and happy state they displayed the same passion for the dance and song which is general throughout Africa."

With respect to his religion, the unenlightened Hottentot, although he believed in a good God and a malignant power, had neither temples nor priests; but with superstitious veneration he hailed the new and full moon with dances and rejoicings, prolonged throughout the night. Certain localities were held sacred as the abodes of departed spirits. Lastly, the Hottentot had a little shining beetle, which he exalted almost to the dignity of a deity. From the cruel treatment which this unfortunate tribe has received from its provincial oppressors, their number at present in the colony does not surpass 15,000. The few kraals of independent Hottentots which still remain on its outer border are supposed to amount to about 10,000.

Good Hope || Goonee.

For a further account of the Hottentots, see the article Africa, vol. i. part ii. p. 226. Under the heads Boshuanas, and Bosjesmans or Bushmen, the tribes which bear these names will be found described.

According to the official returns, the population of the Cape Colony, in 1831, consisted of, whites and free coloured, males 48,672, females 44,043; slaves, males 18,812, females 15,321; total, 126,848. But it seems probable that this is a statement in defect rather than in excess, and that the population may be taken at 140,000.

Good Hope, or *Hope Island*, an island in the South Pacific Ocean, discovered by Le Maire and Schouten in 1616. The land is mountainous, and covered with cocoa-nut trees. Long. 174. 50. E. Lat. 16. S.

GOODOUR, a town of Hindustan, in the Balaghaut ceded territory, ten miles west by south from the town of Carnaul. Long. 77. 51. E. Lat. 15. 46. N.

GOOHAUT, a town in the Afghan territories, in the province of Cabul, twelve miles west of the Indus. Long. 76. 40. E. Lat. 32. 51. N.

GOOLE, a hamlet in the parish of Snaith and the wapentake of Osgoldcross, in the west riding of Yorkshire. As it stands on the river Ouse, which is navigable to that point, it has appeared advisable to establish a custom-house there, by which the trade of the whole surrounding country has been considerably facilitated and increased. The population amounted in 1801 to 294, in 1811 to 320, in 1821 to 450, and in 1831 to 1671.

GOOLGUNGE, a town of Hindustan, in the province of Allahabad and district of Bundelcund, twenty-six miles south-south-east from Patna. It is situated in long. 85. 38. E. and lat. 24. 26. N.

GOOLPUSSRA, a town or village in the Nepaul dominions. It stands on the skirts of the great forest; and although it is the thoroughfare for most of the merchandise which passes between Nepaul, Benares, Oude, and Patna, over the Cheesapany Mountains, it is but a mean village. The road thence to Bechiacori through the great forest is practicable for wheel-carriages, and there are two or three stations on the way. In the vicinity of this place is an extensive forest of fine timber, especially of that kind called saul, next in value to teak, some of the trees of which measure a hundred feet between the branches, and from eight to nine feet in the girth. Long. 85. 10. E. Lat. 27. 1. N.

GOOMSUR, a town of Hindustan, at the north-west extremity of the Northern Circars, forty-three miles north-west from Ganjam. The neighbouring country is covered with impervious forests of bamboo, on which the inhabitants were wont to rely for their defence, and did not think it necessary to erect redoubts. The whole district is considered as one of the hottest regions in India. Long. 84. 55. E. Lat. 19. 53. N.

GOOMTY, a river of Hindustan, so named from its winding course, and which has its source in the mountains of Kemaon, whence it flows in a south-east direction through the province of Oude, and, after passing the cities of Lucknow, Sultanpore, and Joanpore, falls into the Ganges about fourteen miles below Benares. It is navigable for boats as high as Lucknow at all times of the year.

GOONDIPOORAM, a town of Hindustan, in the Northern Circars, forty-six miles north by west from Cicacole. It is in long. 83. 51. E. and lat. 18. 59. N.

GOONEE, a river of Hindustan, in the province of Sinde, which rises in the hills of Poollejar, and flowing a westerly direction, afterwards falls into the Indus, ith which it forms a very large island called Majur. uring the rainy season it is navigable for boats from andavie, a port of Cutch, to Hyderabad, the capital of inde.

GOORACKPOOR, a district of Hindustan, in the pro- nce of Oude, situated to the north of the Goggrah or ewah river, and between the 26th and 28th degrees of orth latitude. To the north it is separated by hills and rests from the Nepaulese territories, to the south it is ounded by the Dewah or Goggrah river, and on the ist by the Gunduck. In 1801 this district was ceded the British, in virtue of a treaty concluded between ie nabob of Oude and the Marquis Wellesley. The ountry abounds with forests of fine timber; and since it ame into the possession of the British, periodical fairs ave been established, in order to promote a free inter- ourse with the Nepaulese, and the other inhabitants of the ountains to the north, and with Gooracckpoor. These irs are numerously attended by traders from the neigh- ouring provinces, and to them also was sent part of the ompany's investment of woollens. The principal towns e Gooracckpoor, Buckrah, and Mutgur. If this district ere properly cleared and cultivated, it is thought that it ould be one of the finest parts of the British dominions India, being situated to the north of Bengal, and wa- red by three rivers, and various streams from the hills.

GOORACKPOOR, the capital of the above-mentioned strict, situated on the eastern bank of the Boora Rapty ver, which is navigable for boats at all seasons of the ear. It had formerly a brick wall, which is now in ruins. is the residence of the civil establishment of the dis- ict. The travelling distance east from Lucknow is 170 iles. Long. 83. 22. E. Lat. 26. 45. N.

GOOSE. See ORNITHOLOGY.

Goose-Neck, in a ship, a piece of iron fixed on the one d of the tiller, to which the lanyard of the whip-staff or ie wheel-rope comes, for steering the ship.

Goose-Wing, in nautical language. When a ship sails efore or with a quarter-wind on a fresh gale, to make the ore way, a boom and sail are launched out on the lee- de, and the sail so fitted is called a *goose-wing*.

GOOTY, a hilly district of Hindustan, in the Balag- aut ceded territories, situated chiefly between the 15th d 16th degrees of north latitude. Gooty formed a dis- ict in the empire of Aurungzebe. Between the years 776 and 1779 it was conquered by Hyder, and the ra- h was carried off, and never more heard of. With the st of the Balaghaut, it was ceded by the nizam to the ompany in 1804, and now forms part of the collectorship Bellary. The fortress of Gooty is the capital, and was rmerly the seat of an independent Mahratta govern- ent. It is 228 miles travelling distance from Seringa- atam, and 269 from Madras. Long. 77. 35. E. Lat. 15. N.

GOPPINGEN, a bailiwick of the kingdom of Wurtem- erg, in the circle of the Black Forest. It extends over 14 square miles, comprehending one city, three market- owns, and sixty-nine villages, occupied by 28,106 per- ons. It is mountainous and woody, with little corn land; ut produces large quantities of flax, and breeds much ack cattle. The capital is a city of the same name, si- tated on the river Fils, and was burnt down in 1782; but has been rebuilt, and now contains 620 houses, with 040 inhabitants, who are employed in spinning and weav- g cotton, and in making paper, hats, porcelain, woollen oth, and other articles. Long. 9. 30. 10. E. Lat. 48. 41. . N.

GORAGAUT, a town and zemindary of Hindustan, in ie province of Bengal, ninety miles north-east from oorshedabad. Long. 89. 10. E. Lat. 25. 13. N.

GORAM ISLE, a small island in the Eastern Seas, about twenty miles in circumference, and about one day's sail east by north from Banda. It is inhabited by Mahommedans, and is said to contain twelve mosques. In 1774 the Dutch attacked it with an armed force of Buggesses, but they were repulsed by the inhabitants.

GORCAH, or GHOORCAH, a district of Hindustan, in the province of Nepaul. It is situated between the 28th and 29th degrees of north latitude, and between the 84th and 85th degrees of east longitude. The country is mountainous and barren, and is intersected by a branch of the Kaly Gunduk river. The territory is principally occupied by the Brahminical and Khebric tribes, though it contains several Rajpoot families. It was formerly ruled by an aristocracy, consisting of thirty heads of families; but about fifty years ago one of their chiefs having gained the ascendency, conquered Nepaul, and became the sovereign of the whole country; since which period the history of this district is merged in that of Nepaul.

GORCAH, or GHOORCA, is the capital of the above-mentioned district. After the conquest of Nepaul in 1768, the seat of government was transferred to Catmandoo; and this place having been neglected, is now gone to decay. Near the city is a considerable mass of rock crystal.

GORCUM, a city of the province of Holland, in the Netherlands. It is situated on the right bank of the river Merwe, is strongly fortified, and contains 1390 houses, with 5169 inhabitants, who carry on extensive fisheries, and much trade in corn. Long. 4. 53. 10. E. Lat. 51. 49. 50. N. It is the capital of a circle of the same name, containing 32,680 inhabitants.

GORDIAN KNOT, in *Antiquity*, a knot made in the leathers or harness of the chariot of Gordius king of Phrygia, so very intricate that there was no finding where it began or ended. The inhabitants had a tradition, that the oracle had declared that he who untied this knot should be master of Asia. Alexander having undertaken it, was unable to accomplish it; when, fearing lest his not untying it should be deemed an ill augury, and prove a check in the way of his conquests, he cut it asunder with his sword, and thus either accomplished or eluded the oracle.

GORDIANUS, an illustrious Roman senator, who claimed his descent on the father's side from the Gracchi, and on the mother's from the Emperor Trajan. He seems to have been one of the richest senators of Rome, but his unambitious spirit, and his devotion to the study of literature, probably saved him from a violent death and the loss of his property. He was raised to the dignity of ædile in the reign of Caracalla, and the magnificence of the public shows he exhibited far surpassed any thing which Rome had ever witnessed. He was twice raised to the dignity of consul, by Caracalla A. D. 213, and by Alexander A. D. 229. His long life was spent in the study of letters; nor does he seem to have taken an active part in public affairs till he was named proconsul of Africa by the senate, an appointment which was highly approved of by Alexander, whose original letter on the subject to the senate is still preserved. (*Hist. Aug.* p. 152.) When the tyrant Maximin succeeded to the throne, he appointed a procurator of Africa worthy of himself, who exacted with the utmost severity the taxes he himself had imposed; but being murdered by the people, they proclaimed Gordian and his son emperors, A. D. 237. At first unwilling to accept the honour, he at length yielded to the pressing invitation of the people. The Gordians erected their court at Carthage, and no sooner did the deputation sent by the emperors to the senate make its appearance, than that body joyfully confirmed their election. Meanwhile Capelianus, governor of Mauritania, marched against Carthage with such rapidity, that they were unable to collect troops in sufficient numbers to oppose him. The younger Gordian fell at the head of a few guards; and his father, whose reign had not exceeded thirty-six days, put an end to his life on the first news of the defeat. Gordian was the author of a poem, in thirty books, on the actions of Antoninus Pius and Marcus Aurelius. (*Herodian*, vii.; *Hist. Aug.*)

Gordianus, surnamed the Pius, was grandson of the elder Gordian. When the news of his grandfather's death reached Rome, the senators elected Maximus and Balbinus emperors, as best fitted to oppose the threatened attack of Maximin; but the people insisted that one of the family of Gordian should also be raised to the empire. This boy was only thirteen years of age; and when Maximus and Balbinus fell in an insurrection of the soldiers, Gordian was left as sole emperor. Having married Fabia Sabina Tranquillina, the daughter of his master of rhetoric, he appointed his father-in law Misitheus prefect of the prætorian guards, and through his assistance emancipated himself from the hands of his mother's eunuchs. Misitheus proved himself an able minister, and discharged the military duties of his office with vigour and ability. He induced the young emperor to proceed against the Persians, who had invaded Mesopotamia, and during the whole of the expedition Misitheus watched over the safety and discipline of the army. Misitheus, however, died, with strong suspicions of having been poisoned by Philip, his successor in the prefecture. A short time afterwards a sedition broke out among the soldiers, which was fomented by Philip, and Gordian was killed, A. D. 244, near the conflux of the Euphrates with the little river Aboras. (See *L'Histoire des quatre Gordiens*, par Abbé Dubos; also Caspar, *Historia trium Gordianorum*, Deventer, 1697.)

GORDON, Alexander, a distinguished draughtsman, scholar, and antiquary, who resided many years in Italy, and also travelled in France, Germany, and other countries. The date of his birth has not been ascertained. In 1736 he was appointed secretary to the society for encouraging learning; and the same year he succeeded Dr Stukeley as secretary to the Society of Antiquaries, an office which he resigned in 1741 in favour of Mr Joseph Ames. He was for a short time secretary to the Egyptian Club, composed of Lord Sandwich, Dr Shaw, Dr Pococke, and other distinguished persons who had visited Egypt. In 1741 he accompanied Governor Glen to Carolina, where, besides a grant of land which he received, he held several offices, and died a justice of the peace, leaving a handsome estate to his family. He published, 1. *Itinerarium Septentrionale*, or a Journey through most parts of the Counties of Scotland, in two parts, with sixty-six copperplates, 1726, folio; 2. Supplement to the *Itinerarium*, 1732, folio; 3. The Lives of Pope Alexander VI. and his son Cæsar Borgia, comprehending the wars in the reign of Charles VIII. and Louis XII., and the chief transactions and revolutions in Italy from 1492 to 1516, with an appendix of original pieces; 4. A complete History of the Ancient Amphitheatres, more especially regarding the architecture of these buildings, and in particular that of Verona, by the Marquis Scipio Maffei, translated from the Italian, 1730, 8vo, afterwards enlarged in a second edition; 5. An Essay towards explaining the Hieroglyphical Figures on the Coffin of the ancient Mummy belonging to Captain William Lethieullier, 1737, folio, with cuts; 6. Twenty-five Plates of all the Egyptian Mummies and other Egyptian Antiquities in England, 1739, folio.

Gordon, *Thomas*, noted for his translations and political writings, was born at Kirkcudbright, in Galloway, about the end of the seventeenth century. When a young man he repaired to London, where he supported himself by teaching languages, until he procured employment under the Earl of Oxford, in Queen Anne's time, but in what capacity is not known. He first distinguished himself by two pamphlets in defence of Hoadly, in the Bangorian controversy; and these recommended him to Mr Trenchard, an author of the same stamp, in conjunction with whom he wrote letters under the name of "Cato," upon a variety of important public subjects. About the same time they published another periodical paper, under the title of the "Independent Whig," which was continued some years after Trenchard's death by Gordon alone, and directed against the hierarchy of the church, but with more acrimony than had been evinced in Cato's Letters. On the death of his associate, Sir Robert Walpole retained him to defend his administration, which he did in several pamphlets; and at the time of his death, which happened on the 28th of July 1750, he was first commissioner of the wine licenses, an office which he had enjoyed many years. Gordon published English translations of Sallust and Tacitus, with additional discourses, containing much good matter. Two collections of his tracts have also been preserved; the one entitled A Cordial for Low Spirits, in three volumes; and the other, The Pillars of Priestcraft and Orthodoxy Shaken, in two volumes. But these, like many other posthumous productions, might have been suppressed without detriment to his reputation.

GORE, in *Heraldry*, one of the abatements, which, according to Guillim, denotes a coward. It is a figure consisting of two arch lines, drawn one from the sinister chief and the other from the sinister base, and both meeting in an acute angle in the middle of the fess point. See Heraldry.

GORGE, in *Architecture*, the narrowest part of the Tuscan and Doric capitals, between the astragal, above the shaft of the pillar and the annulets.

Gorge, in *Fortification*, the entrance into any piece of fortification, consisting of the distance or space between the extremities of the two faces; as between the faces of a half-moon, redoubt, or bastion.

GORGED, in *Heraldry*, the bearing of a crown, coronet, or the like, about the neck of a lion, a swan, or other animal; in which case it is said the lion or cygnet is gorged with a ducal or other coronet.

Gorged is also used when the gorge or neck of a peacock, swan, or the like bird, is of a different colour or metal from the rest.

GORGET, a kind of breastplate, like a half-moon, with some device thereon.

GORGONS, in *Antiquity* and *Mythology*. Authors are not agreed in the accounts which they give of the Gorgons. The poets represent them as three sisters, whose names were Stheno, Euryale, and Medusa, the last of whom was mortal; and having been deflowered by Neptune, was killed by Perseus; but the two former were subject neither to age nor to death. They are described as having wings on their shoulders, and serpents round their heads; their hands were of brass, and their teeth of a prodigious size, so that they were objects of terror to mankind. After the death of Medusa, her sisters, according to Virgil, were appointed to keep the gate of the palace of Pluto.

> Multaque præterea variarum monstra ferarum,
> Gorgones, Harpyiæque.

Diodorus Siculus represents the Gorgons and Amazons as having been two warlike nations of women, who inhabited that part of Libya situated on the lake Tritonidis. The extermination of these female nations was not effected till Hercules undertook and performed the task.

Pausanias says that the Gorgons were the daughters of Phorbus, after whose death Medusa his daughter reigned over the people dwelling near the lake Tritonidis. The queen was so passionately fond of hunting and war, that she laid waste the neighbouring countries. At last Perseus made war on them, and killed the queen herself;

but when he came to view the field of battle, he found the queen's corpse so extremely beautiful, that he ordered her head to be cut off, and carried it with him to show it to his countrymen the Greeks, who could not behold it without being struck with astonishment.

Others represent them as a kind of monstrous women, covered with hair, who lived in woods and forests; and others, again, make them animals resembling wild sheep, whose eyes had a poisonous and fatal influence.

GORLESTON, a village, or rather town, of the county of Suffolk, in the hundred of Mutford and Lothingland, 123 miles from London. It may be viewed as a suburb to the town of Yarmouth in Norfolk, from which it is separated only by a bridge over the river Yare. The population amounted in 1801 to 1728, in 1811 to 1814, in 1821 to 1928, and in 1831 to 2116.

GORLÆUS, Abraham, an eminent antiquary, born at Antwerp, who gained a great reputation by collecting medals and other antique remains. He was chiefly fond of the rings and seals of the ancients, of which he published a prodigious number in 1601, under the title of *Dactyliotheca; sive Annulorum Sigillarium, quorum apud priscos tam Græcos quam Romanos usus ex ferro, ære, argento, et auro, Promptuarium.* This was the first part of the work; the second, entitled *Variarum Gemmarum, quibus antiquitas in signando uti solita sculpturæ*, appeared afterwards. This work has undergone several editions, the best of which is that of Leyden, 1695, containing a great number of cuts, and also a short explanation of these by Gronovius. In 1680 he published a collection of medals, which, however, if we may believe the Scaligerana, it is not safe always to trust. Gorlæus selected Delft as the place of his residence, and died there in 1609.

GORLITZ, a city of Prussian Silesia, the capital of a circle of the same name. It stands on the river Neisse, upon an elevated spot, and is a well-built town, with walls around it. It contains several public institutions for education and for benevolence, and eight churches, a public library, and cabinet of natural history. The houses are 1099, and the population 9900 inhabitants, who are industriously employed in various trades and manufactures.

GORZ, a fortified city of the Austrian province of Trieste, on the river Isonzo, containing, besides a cathedral and four other churches, 707 houses, with 9050 inhabitants, who are engaged in silk manufactories, in making leather, and bleaching wax. Near to it is Monte Santo, celebrated for the goodness of its wine. Long. 13. 23. E. Lat. 45. 57. N.

GOSBERTON, a parish of the county of Lincoln, in the parts of Holland and hundred of Kirton, 102 miles from London and eight from Boston. It is in a rich agricultural district. The inhabitants amounted in 1801 to 1139, in 1811 to 1301, in 1821 to 1618, and in 1831 to 1951.

GOSHEN, a canton of Egypt, which Joseph procured for his father and his brethren when they came to dwell in that country. It was the most fruitful part of the country; and its name seems to be derived from the Hebrew, *Geshem*, which signifies "rain;" because this province lying very near the Mediterranean, was exposed to rains, which were very rare in other cantons, and more especially in Upper Egypt.

GOSLAR, a city of the province of Hildesheim, in the kingdom of Hanover. It stands in the Hartz Mountains, at the foot of the Rammelsberg, on the river Gosse. It is an ancient town, with narrow streets and large antiquely-fashioned houses. It contains four churches and two religious houses, and is the seat of some provincial courts of law. Much of the ore extracted from the mines in the neighbourhood is here purified, and a great part of it converted into appropriate utensils in some large manufactories. It has considerable breweries and distilleries, and two vitriol works, and it contains 6700 inhabitants. Long. 10. 14. 1. E. Lat. 54. 27. N.

GOSPEL, the history of the life, actions, death, resurrection, and ascension, and also of the doctrine, of Jesus Christ. The word is Saxon, and of the same import with the Latin term *evangelium*, which signifies glad tidings or good news. This history is contained in the writings of St Matthew, St Mark, St Luke, and St John, who are hence called Evangelists. The Christian church never acknowledged as canonical any more than these four gospels; notwithstanding which several apocryphal gospels are handed down to us, and others are entirely lost.

GOSPORT, a market-town of Hampshire, in the parish of Alverstoke, in the Portsdown division of the hundred of Christchurch, seventy-eight miles from London. It may be considered as one of the suburbs of Portsmouth, from which it is separated by the mouth of the harbours, over which boats of all descriptions are constantly passing from one side to the other. As a part of our greatest naval arsenal, the town is fortified on the land side by a chain of redoubts, and some of the most important fortifications which command the entrance of the harbour; and the anchoring places of Stokes Bay are in this town. The royal brewery and cooperage, the storehouses for various kinds of provisions, and the grand powder magazines of Priddyshard, are all here. To the south is the magnificent hospital for sick and wounded sailors, which is capable of accommodating more than two thousand patients. There is also an extensive establishment for the manufacture of anchors. Besides the trade which Gosport derives from the royal navy, it enjoys considerable foreign commerce. There are markets on Tuesdays, Thursdays, and Saturdays, which are amply supplied. The population depends on the state of peace or of war. It amounted in 1801 to 11,295, in 1811 to 11,279, in 1821 to 10,972, and in 1831 to 12,637.

GOSSAMER is the name of a fine filmy substance, like cobwebs, which is observed floating in the air, in clear days in autumn, and is more discernible in stubble-fields, and upon furze and other low bushes, than elsewhere.

GOTEBORG, or Gottenburg, a province in the southern part of Sweden. It is bounded on the north by Norway, on the east by Elfsborg, on the south by Halland, and on the west by the German Ocean. It extends over 1894 square miles, is divided into five bailiwicks, comprehends five cities or towns, and 2891 rural establishments; and has a population of 119,504 individuals. The surface is generally mountainous, but has some plains in the southern parts; but even in these, the soil is so thin as to be scantily productive. The chief food of the inhabitants, as well as the chief exports, consists of fish, which abound on the coasts and in the rivers.

GOTHA, a principality forming a part of the dominions of the grand duchy of Saxe Coburg Gotha, in Germany. It is an elevated district of the Thuringian Mountains, where, though the climate is cold, the soil is fertile. Some of the portions are separated from the main body, and from each other, by the intervening territory of other states. The extent of the whole is 649 square miles. It is divided into fourteen bailiwicks, and contains five cities, six market-towns, a hundred and sixty-four villages, with 88,639 inhabitants. The capital, the city of Gotha, in longitude 10. 37. 33. east, and latitude 50. 57. 4. north, is 1220 feet above the level of the sea, one of the most beautiful of the Saxon cities. It contains 1256 houses, and 12,500 inhabitants. The ducal palace or castle rises above the city, and has a magnificent appearance from the whole surrounding country. There are in it some fine pictures, a library of 60,000 volumes, and a museum of coins and medals, both ancient and modern, surpassing any other in Europe. Near the city, on a lake, is an astronomical observatory, long occupied by Baron Zach, the celebrated astronomer. It is a town of considerable trade, having manufactories of cotton, woollen, and linen goods, and other articles.

GOTHARD, one of the highest mountains of Switzerland, and from the top of which there is one of the finest prospects in the world. It is eight miles from Aldorf.

GOTHEBORG, Gothenburg, or Gottenburg. See Goteborg and Gottenburg.

GOTHIC, in general, whatever has any relation to the Goths. Thus we say, Gothic customs, Gothic architecture, &c. See Architecture.

GOTHOFRED, or Godefroy, Denis or Dionysius, a celebrated jurisconsult, born at Paris in 1549, was allied by birth to the highest families connected with the profession of law, and himself one of its most distinguished ornaments. After having completed his classical studies, he applied himself to that of law, and received the instructions of the famous professors who then taught in the universities of Louvain, Cologne, and Heidelberg. On his return to France, the civil disorders which broke out in all parts having forced him to seek an asylum in foreign countries, he retired to Geneva, where he hoped to find the tranquillity necessary for his pursuits. He was received with distinction, and nominated to a chair of law in 1580. Henry IV. appointed him magistrate of Gex in 1589; but this city having the year after been taken by the Duke of Savoy, his house was pillaged, and no resource remained for him but to pass into Germany. He, however, proceeded no farther than Strasburg, where he taught the Pandects from 1591 till 1600, when the elector palatine called him to Heidelberg. But the proceedings of his colleagues forced him six months afterwards to return to Strasburg, where he remained three years more, at the end of which time he consented to resume his functions at Heidelberg, upon an assurance which was given him that he should have nothing to apprehend from the jealousy of the other professors. It was only then that his countrymen became sensible of the fault which had been committed in not endeavouring to retain in France a man of such distinguished merit, and he was offered the chair which Cujas had just left vacant at Bourges; but he declined the offer upon the ground of his age, which did not admit of his attempting to form a new establishment; and he alleged the same excuse in opposition to all the instances which were made to draw him to Angers, to Valence, and to other universities of France and Germany. In 1618 he was sent as deputy by the elector palatine to Louis XIII., who received him well, and solicited him to remain in Paris; but Godefroy had become attached to Heidelberg, where he enjoyed all the consideration due to his talents, and where he desired to end his days. In this expectation, however, he was disappointed. The war, which extended to the palatinate, forced him to return a third time to Strasburg, where, oppressed with grief and infirmities, he expired on the 7th of September 1622, in the seventy-third year of his age. His friend Bernegger pronounced his funeral oration, which is printed in the *Opuscula* of Loisel. Of all the works of Godefroy, that which does him the greatest honour, and ensures him a permanent rank amongst jurisconsults, is his edition of the *Corpus Juris Civilis*, the publication of which forms an epoch in the history of the science. His text is that which had been adopted for ordinary reading in the universities and at the bar, and his notes are much esteemed. The *Corpus* of Godefroy has passed through a number of editions, but the most valuable are those of Paris, Vitré, 1628, in two vols. folio, and Amsterdam, Elzevir, 1363, also in two vols. folio. Among the other works of Godefroy may be mentioned, 1. Notæ in Ciceronem, Lyons, 1588 and 1591, in 4to; 2. Antiquæ Historiæ ex xxvii. auctoribus contextæ libri sex, Basil, 1590, in 8vo; 3. Conjecturæ, variæ lectiones, et loci communes in Seneca, printed at the end of the works of Seneca; 4. Autores Latinæ linguæ in unum redacti corpus, adjectis notis, Geneva, 1595 and 1602, in 4to; 5. Maintenue et Défense des Princes souverains et Eglises Chrétiennes contre les attentats et excommunications des Papes de Rome, 1594, in 8vo: 6. Dissertatio de Nobilitate, Spires, 1611, in 4to; 7. Statuta Galliæ juxta Francorum, Burgundiorum, Gothorum et Anglorum in ea dominantium Consuetudines, Frankfort, 1611, in folio. (A.)

GOTHS (in Latin Gothi, Goti, and Gothones), a secondary denomination of that great, powerful, and victorious race which, after a protracted struggle, at length overturned the Roman empire, and diffused itself throughout the whole of Europe, excepting Russia, Poland, and Hungary. The Scythians or Goths were distinguished from the Celts, with whom they have often been confounded, by characteristics equally obvious and remarkable. This we shall have occasion to establish in the sequel of the present article. Many learned authors, however, have contended for the identity of these races; all antiquity has been ransacked for proofs and authorities by the writers on the opposite sides of the question; and in a discussion which might surely have been carried on with moderation and good manners, the utmost heat and exacerbation of feeling have unaccountably been evinced. Amongst those who have contended for the identity of the Goths and Celts, the first place is due to Cluverius and Pelloutier, who have asserted this proposition in its most unqualified form; and likewise to Sir William Jones, though he contends for nothing more than an identity of origin, leaving the question of subsequent divergence and secondary distinction untouched. On the other hand, of all the champions for the diversity of these races, Mr Pinkerton is by far the most formidable, and, seconded as his views have been by an able writer in the *Edinburgh Review*, and also by Dr Jamieson in his *Hermes Sythicus*, they must be allowed to have great weight by all who attentively consider and examine the question at issue. Conceiving that the arguments and reasonings of Cluverius and Pelloutier have been entirely overthrown, and that the diversity contended for has been established by a mass of evidence and authority which cannot be shaken, what we propose in this article, therefore, is to lay before our readers the substance of Mr Pinkerton's very learned argument, modified however by the views of succeeding writers.

Of the *Scythians* an ample account is given by Herodotus in his fourth book, where he also mentions the *Getæ*, whom Darius subdued whilst advancing against the wandering Scythians who lived on the other side of the Ister or Danube. From the earliest periods of history, therefore, mention is made of the *Scythæ* and *Getæ* as only separated by a river. But the name of *Goths* is not nearly so ancient. The first mention of it occurs in the time of the Emperor Decius, in the year of Christ 250, when part of them invaded the empire from Getia, and Decius, in attempting to expel them from Thrace, was vanquished and slain. After this they are as frequently mentioned in the Latin authors by the names of *Getæ* and *Gothi*, as the *Scythæ* formerly were in the Greek; and, subsequently to this period, all the Greek writers uniformly call those *Scythæ* whom the Latin authors denominate *Gothi*. This being the case, Mr Pinkerton shows, first, that the *Getæ* and *Gothi* were the same people; and, secondly, that the *Getæ* or *Gothi* were the same with the *Scythæ*.

1. That the *Getæ* and *Gothi* were the same, is proved by a multitude of authorities, which our limits prevent us from enumerating in detail. It may suffice to mention, that Dio, who wrote under Alexander Severus, about the year 230, entitles his history of the Goths Γετικον, or the *Getic*

istory; that Spartian, who wrote about the year 300, ays, in his Life of Antoninus Caracallus, *Gotti Getæ diceren-ur*, "the Goths were then called Getæ," and, again, in his ife of Antoninus Geta, *Getticus quasi Gotticus*, "Getic ; we would now say Gothic;" that Claudian always calls ie Goths *Getæ*, and entitles his poem on the Gothic war *)e bello Getico;* that Sidonius Apollinaris frequently calls ie Goths *Getæ*, and denominates the Ostrogoths *Massa-etæ;* that Orosius says, *Getæ qui et nunc Gothi*, "the etæ, who are now also called Goths;" that St Jerome ates that the Goths were anciently called Getæ; that in ie panegyric of Ennodius, on Theodoric, king of the oths, it is said, "Nam illud quo ore celebrandum est quod *etici* instrumenta roboris, dum provides ne interpellentur ia nostra, custodis;" that, according to Procopius, "the oths are a Getic race;" that Jornandes entitles his history *)e Getarum sive Gothorum origine et rebus Gestis*, and onstantly uses the names *Getæ* and *Gothi* as synony-ous; and, finally, that Isidorus says the Getæ and Gothi e the same. This identity, therefore, seems to be com-etely established; especially as there is not even a sha-ow of authority on the opposite side.

2. It appears equally certain that the *Getæ* or Goths ere the same with the Scythians. Strabo, Pliny, and Pto-my, all rank the Getæ as Scythians. Trebellius Pollio, *in alieno*, says, "*Scythæ* autem, id est, *pars Gothorum*, Asiam istabant." Dexippus, who is supposed to have written in ie reign of Gallienus, entitled his history of the wars be-veen the Romans and Goths ΣΚΥΘΙΚΑ, or Scythic histo-es, and called the Goths Σκυθαι, *Scythæ*. Priscus em-oys the words *Scythians* and *Goths* synonymously. Eu-ipius denominates the *Scythians*, whom Valens planted Mœsia, *Goths*. Procopius speaks of "all the other othic nations, who were also called *Scythians* in ancient nes." Theophanes, writing in the year 370, states "that e Scythians are in their tongue called Goths," according the relation of Trajanus Patricius, "in the history of his vn time." Syncellus states that "the Scythians are also lled Goths in their own language;" and the same author kewise says, "when a great many Scythians, called Goths, id passed the river Ister in the time of Decius, they ra-ged the Roman empire." Jornandes always speaks of the oths, Getæ, and Scythæ, as one people, and uses these imes synonymously. Isidorus commences his chronicle the Goths in Spain with these words: "Gothorum anti-iissimum esse regnum certum est, quod ex regno *Scytha-m* est exortum." Procopius frequently calls the Fede-ti, so well known in the Lower Empire, *Goths;* and Sui-s, *in voce*, denominates them *Scythians*. Lastly, Ammi-us Marcellinus, mentioning the death of Decius, who fell battle against the Goths or Getæ, denominates the latter *cythicæ gentes*. "That the *Scythians* and *Getæ* were the me people," says Dr Jamieson, "is attested by incontro-rtible evidence."[1]

Having thus established that the Scythians, Getæ, and oths, are all one people, Pinkerton next proceeds to con-ler the question whether the Scythians or Goths went om Scandinavia into Asia, or whether, on the contrary, ey came from Asia into Europe. And, in prosecution of is curious and important inquiry, he endeavours, in the st place, to show that the common notion of the Scy-ians having originated from Scandinavia is groundless. iis opinion, which has been somewhat hastily adopted by ontesquieu, Gibbon, and other writers of the first name, s been built on a single sentence in the fourth chapter Jornandes, namely, "Ex hac igitur Scania insula, quasi *icina gentium*, aut certe velut *vagina nationum*, cum rege o nomine Berig Gothi quondam memorantur egressi." But no weight can reasonably be attached to this single authority, however direct and explicit; first, because the work of Jornandes being, as is commonly supposed, only an abridgment of a large history of the Goths by his contemporary Cassiodorus, it is possible that in this as well as in other particulars, the abridgment may be inaccurate, more especially as it would seem to have been written solely from memory, after a perusal of three days; secondly, because though he generally followed Cassiodorus, he added many things from the Greek and Roman writers; thirdly, because Scandinavia having been, down to a late period, almost overrun with impenetrable forests, there was neither room nor subsistence in that country for so vast a population as that which so often invaded, and at last overturned, the Roman empire; fourthly, because we learn from Adam of Bremen, who wrote in the eleventh century, that, even in Denmark, the sea coasts alone were then peopled, whilst the interior parts of the country were one immense forest; and, lastly, because it can be proved from many authorities, in opposition to the single one of Jornandes, which is moreover highly improbable in itself, that the Scythians originated from Asia. On this last point some of Pinkerton's authorities have been disputed both by the author of the *Vindication of the Celts*, and also by the able writer in the *Edinburgh Review* already referred to, who have each convicted him of sundry errors and inaccuracies of detail; but such is the redundancy of evidence which he has produced in support of his views, that, after every reasonable deduction has been made, enough remains to establish the position, that at a period probably as early as the year 1400 before Christ, the Scythians had advanced from the vicinity of the river Araxes, entered the Cimmerian Bosphorus, whence they afterwards spread themselves westward and northward over a considerable part of Europe. He shows that Herodotus, Diodorus, and indeed all the writers who have occasion to mention the subject, down to the sixth century, when Jornandes wrote, are in opposition to this monastic historian, and uniformly represent the Scythians as having passed, from the south of Asia, in a north-westerly direction, until, in process of time, they spread themselves all over Europe.

We pass over the chapter upon the real origin and first progress of the Scythians or Goths, whom Pinkerton traces from the banks of the Indus, through Persia, to the shores of the Caspian, and proceed to state the results at which he has arrived in the succeeding one, which treats of the western settlements of this people. From their intermediate position on the Euxine, the Scythians gradually extended themselves over the most part of Europe; and, according to Pinkerton, the Greeks and Romans, though refined by adventitious circumstances, certainly belonged to the same great family of mankind. We may also mention here, that, both on historical and on philological grounds, Dr Jamieson, in his Dissertation and in his *Hermes Scythicus*, contends strenuously for the Scythian origin of the Greeks, and, by many new and ingenious arguments, supports this, which forms one of the principal points of Pinkerton's hypothesis. According to the latter, the Scythians successively invaded and settled in Thrace, Illyricum, Greece, Italy, Germany, and Scandinavia; in other words, he endeavours to show that the Thracians, Illyrians, Greeks, Italians, Germans, and Scandinavians, were all Scythians or Goths. And all this seems to us to be proved, as far at least as such a subject can be established by ancient authorities. The Scythian origin of the Thracians and Illyrians is indisputable. But there is more difficulty respecting the ancient inhabitants of Greece, taking that denomination in the large sense given to *Hellas*, as including Macedon, and extending from Thrace and Illyricum to the Cretan, Ionian, and Sicilian Seas. From the concurrent testimony of the Greek writers, it appears, first, that the ancient inhabitants of Hellas were the *Pelasgi;* and, secondly, that the *Hellenes* were the same people who had formerly been called the Pelasgi, being, in fact, a small tribe of the Pelasgi who, having last settled in the country, had the good fortune to give their name to the whole. Pinkerton next considers, first, who the Pelasgi were not, and, secondly, who they were. They were not Egyptians, because the two small colonies of Egyptians who settled in Athens and Argos from the earliest times, were specially distinguished as a different people from the Pelasgi; because the Greek mythology has little or no affinity to the Egyptian; and because the Greek language differs entirely from the Coptic, in which are embodied the remains of the old Egyptian. They were not Phœnicians, because of all the reasons urged respecting the Egyptians. They were not Celts, because the latter were confined to the farthest west, whereas Greece was surrounded by Scythians; because the form and structure of the Celtic tongue are as remote as possible from that of the Greek; and because the manners, customs, and usages of the Celts, as described by the Greek and Roman authors, are entirely dissimilar to those of the earliest Greeks. They were not Sarmatæ, because there is reason to doubt whether the latter entered Europe more than a thousand years before our era, whereas the progressive advancement of the Scythians dates from a much earlier period; because the manners of the earliest Greeks had nothing in common with those of the Sarmatic or Tartar tribes; and because the Slavonic language, which was spoken by the Sarmatians, differs from the Greek in grammatical structure as well as in nomenclature. But the Pelasgi, or Hellenes, were Scythians of Thrace; a position which, besides being established by authority, is rendered highly probable from the circumstance that ancient Hellas was everywhere surrounded either by the Scythians or the sea. For the full illustration of this branch of the subject, however, we must refer the reader to the fourth chapter of Mr Pinkerton's Dissertation, to Dr Doig's paper on the Ancient Hellenes,[1] and to the *Hermes Scythicus* of Dr Jamieson, *passim.* A similar mode of reasoning leads to the conclusion that the Italians, as well as the Greeks, were Scythians.

---

[1] *Hermes Scythicus*, Dissert. on the Origin of the Greeks, sec. 2.

In the second part of his Dissertation, where he contemplates the extended settlements of the Scythians or Goths over all Germany, and in Scandinavia, Mr Pinkerton endeavours, in the first place, to show, negatively, that the Germans were not of Sarmatic nor of Celtic origin; and, secondly, he attempts to prove, positively, that they were Scythians, from identity of language, from the testimonies of the ancient authors, and from similarity of manners and institutions. The details required for the illustration of both branches of his argument are necessarily complicated, and do not admit of abridgment. But the reasoning is throughout strictly logical, and the conclusion can only be affected by impeaching the accuracy or validity of the premises. This, we are aware, has, to a considerable extent, been done in the *Vindication of the Celts*, in the *Edinburgh Review*, and in other works; and it must be confessed that the most unsparing severity of criticism is provoked, and in some measure justified, by the tone of insolent dogmatism which Pinkerton thought proper to assume, no less than by the contemptuous language in which he is pleased to characterise almost every writer whose opinions happened to differ from his own. But notwithstanding all his errors, aggravated as they unfortunately are by some misrepresentations, the stability of his argument remains as yet unshaken; and even those who have been most successful in detecting his blunders, will, if impartial, be the first to admit the great learning which he has brought to bear on his subject, and the ability with which he has throughout conducted his reasoning. In tracing the distinctive characteristics of the Goths and the Celts, he has, in fact, established his case, independently altogether of the positive evidence derived from authorities, which is afterwards supplied in profusion. Races of men which are found to differ in person, in manners, in laws, in religion, and in language, cannot, upon any known principle of reason, be admitted to have had a common origin, whatever we may be led to believe upon the paramount authority of revelation.

Upon the whole, in reference to the subject of the Goths and Celts, the following points may be considered as established by the best evidence which the case admits of, viz. 1. At a period so early as the age of Sesostris, that is, at least 1400 years before Christ, the Scythians, previously established on the western shores of the Caspian and the eastern shores of the Euxine, had extended their conquests into Europe, and advanced at least as far as Thrace and the surrounding countries. 2. About 640 years before Christ, the Scythians drove the Cimmerians (believed to be the same people with the Cimbri and the Cymry) out of Europe, or forced them to take refuge in wild, mountainous, and inaccessible regions. 3. The Scythæ were afterwards known in history by the names of *Getæ*, *Gothi*, and *Germani;* but whether distinguished by these names, or by the more comprehensive appellation of *Scythians*, they are to be regarded as one and the same people. 4. The principal part of the population of every country in Europe, excepting Russia, Poland, and Hungary, where the Slavonic race predominates, is of Gothic origin and descent, though variously modified by the force of adventitious circumstances. 5. With regard to the Celts, the testimony of the earliest writers authorizes us to place their principal settlement, in the fifth century before our era, in the south-west of Gaul, or neighbourhood of the Pyrenees, whence they appear to have been driven by the Germans or Goths on the east, and the Aquitani (probably an Iberian race) on the south, to that part of Gaul where they were found in the time of Cæsar. 6. The Slavi, who invaded the north-west of Europe after the destruction of the Roman empire, were an Asiatic tribe; and the present inhabitants and languages of Russia, Bohemia, Hungary, Poland, and Dalmatia, are derived from them.

Dr Jamieson, in the Dissertation prefixed to his *Hermes Scythicus*, adopts the same views, and follows nearly the same line of argument, as Mr Pinkerton, in considering the historical proofs of the Scythian origin of the Greeks. He shows that the Scythians and Getæ were one people, that the Goths were identical with the Getæ, and that the Thracians were of Scythian origin. He then treats of the diffusion of the Pelasgi throughout Greece; the identity of the Hellenes with the Pelasgi; the erroneous opinions which have been entertained respecting the origin of this people; the origin of their name; the proofs from testimony of the Scythian origin of the Pelasgi; the progress of this people as illustrative of their origin; the language of the Pelasgi; and, lastly, the resemblance of the Greek language to that of the Scythians. He next adverts to the origin of the religion of the Greeks, and of those called Hyperboreans, and, by an elaborate analytical examination, endeavours to show that the mythology of the Greeks, or at least their theocracy, was of Scythian descent, and merely an improved or polished form of the ruder system of superstition which the Goths imported into Europe from their original settlements, and of which the principal features are still preserved in the Scandinavian mythology. These topics exhaust the historical disquisition, which, however, is in no small degree purely philological. But, in the second part of his work entitled *Hermes Scythicus*, the learned and estimable author applies himself to demonstrate the affinity of the Scythian and Greek language by a critical and etymological examination of the purely elementary parts of the one, with cognate or corresponding forms of expression in the other; and, in prosecuting this refined and delicate analysis, he displays equal erudition and ingenuity, accompanied, however, it must be admitted, with a little occasional straining. Whatever may be thought of the hypothesis, therefore, the learning brought to bear upon the subject is worthy of all acceptation; and every philosophical inquirer into the origin and structure of languages must feel grateful to Dr Jamieson for the curious and interesting information which he has so laboriously accumulated.

---

[1] *Transactions of the Royal Society of Edinburgh*, vol. iii. part 2, p. 131.

The most ancient proofs of the affinity of Scythian and Greek, which the doctor has referred to in his inquiry, are derived from the celebrated version of Ulphilas, bishop of the Mœso-Goths, which appears to have been executed about the year 360 of our era, though some learned writers have affirmed that it was executed in the reign of Constantine the Great. It is much to be regretted, that of the labours of Ulphilas, all that remains is his version of the four gospels, nearly one half of which has been lost; and some fragments of his translation of the Epistle to the Romans. The proofs derivable from the Mœso-Gothic are thus extremely limited. But recourse may be had to the Anglo-Saxon, a derivative dialect of the ancient Gothic, introduced into England about the year 450, or nearly a century after the date of the version of Ulphilas. There is not, indeed, extant any Anglo-Saxon writer older than Caedmon, who flourished about three centuries later than the Bishop of Mœsia; but so close is the affinity of these two languages, that Hickes, the learned author of the *Thesaurus Linguarum Septentrionalium* has included both in the same grammar. The form of speech which has the next claim in point of antiquity is the Alemanic or Franco-Theotiscan; but of this there exist no memorials of an earlier date than the reign of Charlemagne. The Islandic is the oldest and purest dialect of the Gothic which still exists as a living language. This language, in its more ancient form, has been called the Runic, from the character in which it was written; and in it Sæmund the Wise wrote the Edda which bears his name, towards the close of the eleventh century. The Suio-Gothic, including the ancient language of Sweden, is nearly allied to the Islandic, and constitutes one of the sources from which the proofs of affinity are principally derived. Finally, without attempting to pronounce any opinion as to the result of Dr Jamieson's analytical investigation, we may however be permitted to observe, that, if there exist such an affinity as that contended for between the Gothic and Greek, and if an argument be thence deduced as to the Scythian origin of the people by whom the latter was spoken, the well-known fact of the striking affinity, amounting almost to identity, which is found to subsist between the Greek and the sacred language of India, the Sanscrit, must give an entirely new direction to the inquiry into the origin and descent of nations, and lead us to extend our views on this subject far beyond the range to which Dr Jamieson, and those who have followed in his footsteps, have confined their researches.

Pinkerton's *History of Scotland*, vol. ii. Dissertation on the Origin and Progress of the Scythians and Goths, Edinburgh, 1814, in 8vo. Vindication of the Celts, from Ancient Authorities; with observations on Mr Pinkerton's Hypothesis concerning the Origin of the European Nations, London, 1803. Edinburgh Review, vol. ii. p. 355 et seqq. Jamieson's *Hermes Scythicus*, or the Radical Affinities of the Greek and Latin Languages to the Gothic, &c. Edinburgh, 1814. Doig on the Ancient Hellenes, *Edinburgh Transactions*, vol. iii.) (A.)

GOTTENBURG, a city, the capital of the province of that name, in Sweden. It is built on the south side of the Goetaelf, about two miles from its mouth. The harbour is good, and capable of admitting ships of war. It contains 1500 houses, and 21,540 inhabitants. The trade is very considerable, as well for the export of native productions, wood, iron, and copper, as for the import of East and West India goods and articles from the south of Europe. It is situated in longitude 11. 33. E. and latitude 57. 42. N.

GOTTINGEN, one of the provinces, called a principality, into which the kingdom of Hanover is divided. It was formerly a part of the duchy of Brunswick, but was afterwards united with Calenburg. Of late some parts of Hesse, and the bailiwick of Hunnersruck in Hildesheim, have been united with it, and the whole extends over 811 square miles, or 519,040 English acres. The province is bounded on the north by the duchy of Brunswick and the province of Grubenhagen, on the east by Grubenhagen, on the south by the Prussian provinces and by Hesse Cassel, and on the west by Hesse and the Prussian Westphalian dominions. In 1812 it contained 96,593 inhabitants, of whom 2374 were Catholics, 5680 Reformed, 1166 Jews, and the remainder Lutherans. There has been a rapid increase in the population since that period.

The face of the country is hilly, almost mountainous; but between the elevations are valleys, through which the various rivers run, of greater or less extent, and of very high fertility. The Weser, formed by the junction of the Werra and the Fulda, is the principal river, into which the Line falls, and is navigable to Münden. The soil is good, and the cultivation well conducted, so that the province yields much more both of corn and cattle than it consumes. Besides food, the soil produces flax, hemp, and tobacco. The products of mines are some iron and rock salt, coals, and alum. The manufacture of linen is of the domestic kind, carried on by spinning in the long nights of the winter. The chief foreign trade consists in the exportation of linen, yarn, wax, and honey. The chief place is the city of the name of the province, celebrated for its university, founded in 1734. The professors in it are numerous and learned, and the students vary from 1200 to 2000. It possesses a most valuable library of 300,000 volumes, a botanic garden, several museums, and philosophical apparatus. The collection of models, and the observatory, are valuable establishments. The city contains 923 houses, and about 11,000 inhabitants, exclusively of the members of the university who carry on manufactures of linen, woollen, and other goods. Besides, there are many printing presses.

GOTTLAND, a province in the south of Sweden, including the island of that name, with the others near it on the Baltic Sea, about forty-five miles from the east of Sweden. The province has a surface of 528 square miles, comprehends one city, with 1088 insulated settlements, and contains 32,988 inhabitants. The chief occupation is the fishing and agriculture, the latter of which supplies the scanty demands of the province for food; but potatoes make a great portion of the products. The only trade is at Wisby, the capital of the province.

GOUDA, a city of the Netherlands, in the province of Holland and circle of Rotterdam. It is situated on the river Gauwe, which flows out of the Yssel. It is well built, and has a considerable trade in making serges and baize; but the chief manufacture is that of pottery ware, and especially of tobacco pipes, which affords occupation to more than 5000 persons. It contains five churches: that of St

John is distinguished for one of the most powerful organs in Holland. The inhabitants are 12,000. Long. 4. 35. 50. E. Lat. 51. 50. 51. N.

GOUDHURST, a town of the county of Kent, in the hundred of Marden, within the lake of Scray, forty-four miles from London. It was once a place of some consequence in the woollen manufacture, but that has decayed. The inhabitants amounted in 1801 to 1782, in 1811 to 2082, in 1821 to 2579, and in 1831 to 2758.

GOULART, SIMON, a minister of Geneva, was born at Senlis in 1543, and was one of the most indefatigable writers of his time. He made considerable additions to the Catalogue of Witnesses of the Truth, composed by Illyricus; and acquired a great reputation by his works, the principal of which are, 1. A translation of Seneca; 2. A collection of memorable histories; 3. A translation of St Cyprian *De Lapsis*; 4. Several devotional and moral treatises. He died at Geneva in 1628.

GOVERNMENT.

I.—*The End of Government, viz. the Good or Benefit for the sake of which it exists.*

THE question with respect to Government is a question about the adaptation of means to an end. Notwithstanding the portion of discourse which has been bestowed upon this subject, it is surprising to find, on a close inspection, how few of its principles are settled. The reason is, that the ends and means have not been analysed; and it is only a general and undistinguishing conception of them which is found in the minds of the greatest number of men. Things, in this situation, give rise to interminable disputes; more especially when the deliberation is subject, as here, to the strongest action of personal interest.

In a discourse limited as the present, it would be obviously vain to attempt the accomplishment of such a task as that of the analysis we have mentioned. The mode, however, in which the operation should be conducted, may perhaps be described, and evidence enough exhibited to show in what road we must travel, to approach the goal at which so many have vainly endeavoured to arrive.

The end of Government has been described in a great variety of expressions. By Locke it was said to be "the public good;" by others it has been described as being "the greatest happiness of the greatest number." These, and equivalent expressions, are just; but they are defective, inasmuch as the particular ideas which they embrace are indistinctly announced; and different conceptions are by means of them raised in different minds, and even in the same mind on different occasions.

It is immediately obvious, that a wide and difficult field is presented, and that the whole science of human nature must be explored, to lay a foundation for the science of Government.

To understand what is included in the happiness of the greatest number, we must understand what is included in the happiness of the individuals of whom it is composed.

That dissection of human nature which would be necessary for exhibiting, on proper evidence, the primary elements into which human happiness may be resolved, it is not compatible with the present design to undertake. We must content ourselves with assuming certain results.

We may allow, for example, in general terms, that the lot of every human being is determined by his pains and pleasures; and that his happiness corresponds with the degree in which his pleasures are great, and his pains are small.

Human pains and pleasures are derived from two sources: they are produced either by our fellow-men, or by causes independent of other men.

We may assume it as another principle, that the concern of Government is with the former of these two sources; that its business is to increase to the utmost the pleasures, and diminish to the utmost the pains, which men derive from one another.

Of the laws of nature, on which the condition of man depends, that which is attended with the greatest number of consequences, is the necessity of labour for obtaining the means of subsistence, as well as the means of the greatest part of our pleasures. This is, no doubt, the primary cause of Government; for if nature had produced spontaneously all the objects which we desire, and in sufficient abundance for the desires of all, there would have been no source of dispute or of injury among men; nor would any man have possessed the means of ever acquiring authority over another.

The results are exceedingly different, when nature produces the objects of desire not in sufficient abundance for all. The source of dispute is then exhaustless; and every man has the means of acquiring authority over others, in proportion to the quantity of those objects which he is able to possess.

In this case, the end to be obtained, through Government as the means, is, to make that distribution of the scanty materials of happiness which would ensure the greatest sum of it in the members of the community, taken altogether; preventing every individual, or combination of individuals, from interfering with that distribution, or making any man to have less than his share.

When it is considered that most of the objects of desire, and even the means of subsistence, are the product of labour, it is evident that the means of ensuring labour must be provided for as the foundation of all.

The means for the ensuring of labour are of two sorts; the one made out of the matter of evil, the other made out of the matter of good.

The first sort is commonly denominated force; and under its application the labourers are slaves. This mode of procuring labour we need not consider; for if the end of Government be to produce the greatest happiness of the greatest number, that end cannot be attained by making the greatest number slaves.

The other mode of obtaining labour is by allurement, or the advantage which it brings. To obtain all the objects of desire in the greatest possible quantity, we must obtain labour in the greatest possible quantity; and, to obtain labour in the greatest possible quantity, we must raise to the greatest possible height the advantage attached to labour. It is impossible to attach to labour a greater degree of advantage than the whole of the product of labour. Why so? Because, if you give more to one man than the produce of his labour, you can do so only by taking it away from the produce of some other man's labour. The greatest possible happiness of society is, therefore, attained by ensuring to every man the greatest possible quantity of the produce of his labour.

How is this to be accomplished? for it is obvious that every man who has not all the objects of his desire, has inducement to take them from any other man who is weaker than himself: and how is he to be prevented?

One mode is sufficiently obvious; and it does not appear that there is any other: The union of a certain number of men, to protect one another. The object, it is plain, can best be attained when a great number of men com-ne, and delegate to a small number the power necessary for protecting them all. This is Government.

With respect to the end of Government, or that for the sake of which it exists, it is not conceived to be necessary, on the present occasion, that the analysis should be carried any further. What follows is an attempt to analyze the means.

II.—*The Means of attaining the End of Government, viz. Power, and Securities against the Abuse of that Power.*

Two things are here to be considered; the power with which the small number are intrusted; and the use which they are to make of it.

With respect to the first, there is no difficulty. The elements out of which the power of coercing others is fabricated, are obvious to all. Of these we shall, therefore, not lengthen this article by any explanation.

All the difficult questions of Government relate to the means of restraining those in whose hands are lodged the powers necessary for the protection of all, from making a bad use of it.

Whatever would be the temptations under which individuals would lie, if there was no Government, to take the objects of desire from others weaker than themselves, under the same temptations the members of Government lie to take the objects of desire from the members of the community, if they are not prevented from doing so. Whatever, then, are the reasons for establishing Government, the very same exactly are the reasons for establishing securities, that those intrusted with the powers necessary for protecting others make use of them for that purpose solely, and not for the purpose of taking from the members of the community the objects of desire.

I.—*That the requisite Securities against the Abuse of Power are not found in any of the simple Forms of Government.*

There are three modes in which it may be supposed that the powers for the protection of the community are capable of being exercised. The community may undertake the protection of itself, and of its members. The powers of protection may be placed in the hands of a few. And, lastly, they may be placed in the hands of an individual. The Many, the Few, the One; these varieties appear to exhaust the subject. It is not possible to conceive any hands, or combination of hands, in which the powers of protection can be lodged, which will not fall under one or other of these descriptions. And these varieties correspond to the three forms of Government, the Democratical, the Aristocratical, and the Monarchical.

It will be necessary to look somewhat closely at each of these forms in their order.

1. The Democratical. It is obviously impossible that the community in a body can be present to afford protection to each of its members. It must employ individuals for that purpose. Employing individuals, it must choose them; it must lay down the rules under which they are to act; and it must punish them, if they act in disconformity to those rules. In these functions are included the three great operations of Government; Administration, Legislation, and Judicature. The community, to perform any of these operations, must be assembled. This circumstance alone seems to form a conclusive objection against the democratical form. To assemble the whole of a community as often as the business of Government requires performance, would almost preclude the existence of labour; hence that of property; and hence the existence of the community itself.

There is another objection, not less conclusive. A whole community would form a numerous assembly. But all numerous assemblies are essentially incapable of business. It is unnecessary to be tedious in the proof of this proposition. In an assembly, every thing must be done by speaking and assenting. But where the assembly is numerous, so many persons desire to speak, and feelings, by mutual inflammation, become so violent, that calm and effectual deliberation is impossible.

It may be taken, therefore, as a position, from which there will be no dissent, that a community in mass is ill adapted for the business of Government. There is no principle more in conformity with the sentiments and the practice of the people than this. The management of the joint affairs of any considerable body of the people they never undertake for themselves. What they uniformly do is, to choose a certain number of themselves to be the actors in their stead. Even in the case of a common benefit club, the members choose a committee of management, and content themselves with a general control.

2. The Aristocratical. This term applies to all those cases in which the powers of Government are held by any number of persons intermediate between a single person and the majority. When the number is small, it is common to call the Government an Oligarchy; when it is considerable, to call it an Aristocracy. The cases are essentially the same, because the motives which operate in both are the same. This is a proposition which carries, we think, its own evidence along with it. We, therefore, assume it as a point which will not be disputed.

The source of evil is radically different in the case of aristocracy, from what it is in that of democracy.

The community cannot have an interest opposite to its interest. To affirm this would be a contradiction in terms. The community within itself, and with respect to itself, can have no sinister interest. One community may intend the evil of another; never its own. This is an indubitable proposition, and one of great importance. The community may act wrong from mistake. To suppose that it could from design, would be to suppose that human beings can wish their own misery.

The circumstances from which the inaptitude of the community, as a body, for the business of Government, arises, namely, the inconvenience of assembling them, and the inconvenience of their numbers when assembled, do not necessarily exist in the case of aristocracy. If the number of those who hold among them the powers of Government is so great as to make it inconvenient to assemble them, or impossible for them to deliberate calmly when assembled, this is only an objection to so extended an aristocracy, and has no application to an aristocracy not too numerous, when assembled, for the best exercise of deliberation.

The question is, whether such an aristocracy may be trusted to make that use of the powers of Government which is most conducive to the end for which Government exists?

There may be a strong presumption that any aristocracy, monopolizing the powers of Government, would not possess intellectual powers in any very high perfection. Intellectual powers are the offspring of labour. But an hereditary aristocracy are deprived of the strongest motives to labour. The greater part of them will, therefore, be defective in those mental powers. This is one objection, and an important one, though not the greatest.

We have already observed, that the reason for which Government exists is, that one man, if stronger than another, will take from him whatever that other possesses and he desires. But if one man will do this, so will several. And if powers are put into the hands of a comparatively small number, called an aristocracy, powers which make them stronger than the rest of the community, they will take from the rest of the community as much as they please of the objects of desire. They will thus defeat the very end for which Government was instituted. The unfitness, therefore, of an aristocracy to be intrusted with the powers of Government, rests on demonstration.

3. The Monarchical. It will be seen, and therefore words to make it manifest are unnecessary, that, in most respects, the monarchical form of Government agrees with the aristocratical, and is liable to the same objections.

If Government is founded upon this, as a law of human nature, that a man, if able, will take from others any thing which they have and he desires, it is sufficiently evident that when a man is called a king, it does not change his nature; so that when he has got power to enable him to take from every man what be pleases, he will take whatever he pleases. To suppose that he will not, is to affirm that Government is unnecessary; and that human beings will abstain from injuring one another of their own accord.

It is very evident that this reasoning extends to every modification of the smaller number. Whenever the powers of Government are placed in any hands other than those of the community, whether those of one man, of a few, or of several, those principles of human nature which imply that Government is at all necessary, imply that those persons will make use of them to defeat the very end for which Government exists.

IV.—*An Objection stated, and answered.*

One observation, however, suggests itself. Allowing, it may be said, that this deduction is perfect, and the inference founded upon it indisputable, it is yet true, that if there were no Government, every man would be exposed to depredation from every man; but, under an aristocracy, he is exposed to it only from a few; under a monarchy, only from one.

This is a highly-important objection, and deserves to be minutely investigated.

It is sufficiently obvious, that, if every man is liable to be deprived of what he possesses at the will of every man stronger than himself, the existence of property is impossible; and, if the existence of property is impossible, so also is that of labour, of the means of subsistence for an enlarged community, and hence of the community itself. If the members of such a community are liable to deprivation by only a few hundred men, the members of an aristocracy, it may not be impossible to satiate that limited number with a limited portion of the objects belonging to all. Allowing this view of the subject to be correct, it follows, that the smaller the number of hands into which the powers of Government are permitted to pass, the happier it will be for the community: that an oligarchy, therefore, is better than an aristocracy, and a monarchy better than either.

This view of the subject deserves to be the more carefully considered, because the conclusion to which it leads is the same with that which has been adopted and promulgated by some of the most profound and most benevolent investigators of human affairs. That Government by one man, altogether unlimited and uncontrolled, is better than Government by any modification of aristocracy, is the celebrated opinion of Mr Hobbes, and of the French *Economists*, supported on reasonings which it is not easy to controvert. Government by the many they with reason considered an impossibility. They inferred, therefore, that, of all the possible forms of Government, absolute monarchy is the best.

Experience, if we look only at the outside of the facts, appears to be divided on this subject. Absolute monarchy, under Neros and Caligulas, under such men as emperors of Morocco and sultans of Turkey, is the scourge of human nature. On the other side, the people of Denmark, tired out with the oppression of an aristocracy, resolved that their king should be absolute; and, under their absolute monarch, are as well governed as any people in Europe. In Greece, notwithstanding the defects of democracy, human nature ran a more brilliant career than it has ever done in any other age or country.

As the surface of history affords, therefore, no certain principle of decision, we must go beyond the surface, and penetrate to the springs within.

When it is said that one man, or a limited number of men, will soon be satiated with the objects of desire, and, when they have taken from the community what suffices to satiate them, will protect its members in the enjoyment of the remainder, an important element of the calculation is left out. Human beings are not a passive substance. If human beings, in respect to their rulers, were the same as sheep in respect to their shepherd; and if the king or the aristocracy were as totally exempt from all fear of resistance from the people, and all chance of obtaining more obedience from severity, as the shepherd in the case of the sheep, it does appear that there would be a limit to the motive for taking to one's self the objects of desire. The case will be found to be very much altered when the idea is taken into the account, first, of the resistance to his will which one human being may expect from another; and, secondly, of that perfection in obedience which fear alone can produce.

That one human being will desire to render the person and property of another subservient to his pleasures, notwithstanding the pain or loss of pleasure which it may occasion to that other individual, is the foundation of Government. The desire of the object implies the desire of the power necessary to accomplish the object. The desire, therefore, of that power which is necessary to render the persons and properties of human beings subservient to our pleasures, is a grand governing law of human nature.

What is implied in that desire of power, and, what is the extent to which it carries the actions of men, are the questions which it is necessary to resolve, in order to discover the limit which nature has set to the desire on the part of a king, or an aristocracy, to inflict evil upon the community for their own advantage.

Power is a means to an end. The end is every thing, without exception, which the human being calls pleasure and the removal of pain. The grand instrument for attaining what a man likes is the actions of other men. Power, in its most appropriate signification, therefore, means security for the conformity between the will of one man and the acts of other men. This, we presume, is not a proposition which will be disputed. The master has power over his servant, because when he wills him to do so and so, or, in other words, expresses a desire that he would do so and so, he possesses a kind of security that the actions of the man will correspond to his desire. The general commands his soldiers to perform certain operations, the king commands his subjects to act in a certain manner; and their power is complete or not complete, in proportion as the conformity is complete or not complete between the actions willed and the actions performed. The actions of other men, considered as means for the attainment of the objects of our desire, are perfect or imperfect, in proportion as they are or are not certainly and invariably correspondent to our will. There is no limit, therefore, to the demand of security for the perfection of that correspondence. A man is never satisfied with a smaller degree if he can obtain a greater. And as there is no man whatsoever, whose acts, in some degree or other, in some way or other, more immediately or more remotely may not have some influence as means to our ends, there is no man, the conformity of whose acts to our will we would not give something to secure. The demand, therefore, of power over the acts of other men is really boundless. It is boundless in two ways; boundless in the number of persons to whom we would extend it, and boundless in its degree over the actions of each.

It would be nugatory to say, with a view to explain away this important principle, that some human beings may be so remotely connected with our interests as to make the desire of a conformity between our will and their actions evanescent. It is quite enough to assume, what nobody will deny, that our desire of that conformity is unlimited, in respect to all those men whose actions can be supposed to have any influence on our pains and pleasures. With respect to the rulers of a community, this at least is certain, that they have a desire for the uniformity between their will and the actions of every man in the community. And for our present purpose this is as wide a field as we need to embrace.

With respect to the community, then, we deem it an established truth, that the rulers, one or a few, desire an exact conformity between their will and the acts of every member of the community. It remains for us to inquire to what description of acts it is the nature of this desire to give existence.

There are two classes of means by which the conformity between the will of one man and the acts of other men may be accomplished. The one is pleasure, the other pain.

With regard to securities of the pleasurable sort for obtaining a conformity between one man's will and the acts of other men, it is evident, from experience, that when a man possesses a command over the objects of desire, he may, by imparting those objects to other men, ensure, to a great extent, conformity between his will and their actions. It follows, and is also matter of experience, that the greater the quantity of the objects of desire which he may thus impart to other men, the greater is the number of men between whose actions and his own will he can ensure a conformity. As it has been demonstrated that there is no limit to the number of men whose actions we desire to have conformable to our will, it follows, with equal evidence, that there is no limit to the command which we desire to possess over the objects which ensure the result.

It is, therefore, not true that there is in the mind of a king, or in the minds of an aristocracy, any point of saturation with the objects of desire. The opinion, in examination of which we have gone through the preceding analysis, that a king or an aristocracy may be satiated with the objects of desire, and, after being satiated, leave to the members of the community the greater part of what belongs to them, is an opinion founded upon a partial and incomplete view of the laws of human nature.

We have next to consider the securities of the painful sort which may be employed for attaining conformity between the acts of one man and the will of another.

We are of opinion, that the importance of this part of the subject has not been duly considered; and that the business of government will be ill understood till its numerous consequences have been fully developed.

Pleasure appears to be a feeble instrument of obedience in comparison with pain. It is much more easy to despise pleasure than pain. Above all, it is important to consider, that in this class of instruments is included the power of taking away life, and with it of taking away not only all the pleasures of reality, but, what goes so far beyond them, all the pleasures of hope. This class of securities is, therefore, incomparably the strongest. He who desires obedience, to a high degree of exactness, cannot be satisfied with the power of giving pleasure; he must have the power of inflicting pain. He who desires it to the highest possible degree of exactness, must desire power of inflicting pain sufficient at least to ensure that degree of exactness; that is, an unlimited power of inflicting pain; for, as there is no possible mark by which to distinguish what is sufficient and what is not, and as the human mind sets no bounds to its avidity for the securities of what it deems eminently good, it is sure to extend, beyond almost any limits, its desire of the power of giving pain to others.

It may, however, be said, that how inseparable a part soever of human nature it may appear to be, to desire to possess unlimited power of inflicting pain upon others, it does not follow, that those who possess it will have a desire to make use of it.

This is the next part of the inquiry upon which we have to enter; and we need not add, that it merits all the attention of those who would possess correct ideas upon a subject which involves the greatest interests of mankind.

The chain of inference, in this case, is close and strong, to a most unusual degree. A man desires that the actions of other men shall be instantly and accurately correspondent to his will. He desires that the actions of the greatest possible number shall be so. Terror is the grand instrument. Terror can work only through assurance that evil will follow any want of conformity between the will and the actions willed. Every failure must, therefore, be punished. As there are no bounds to the mind's desire of its pleasure, there are of course no bounds to its desire of perfection in the instruments of that pleasure. There are, therefore, no bounds to its desire of exactness in the conformity between its will and the actions willed; and, by consequence, to the strength of that terror which is its procuring cause. Every, the most minute failure, must be visited with the heaviest infliction; and, as failure in extreme exactness must frequently happen, the occasions of cruelty must be incessant.

We have thus arrived at several conclusions of the highest possible importance. We have seen, that the very principle of human nature upon which the necessity of Government is founded, the propensity of one man to possess himself of the objects of desire at the cost of another, leads on, by infallible sequence, where power over a community is attained, and nothing checks, not only to that degree of plunder which leaves the members (excepting always the recipients and instruments of the plunder) the bare means of subsistence, but to that degree of cruelty which is necessary to keep in existence the most intense terror.

The world affords some decisive experiments upon human nature, in exact conformity with these conclusions. An English gentleman may be taken as a favourable specimen of civilization, of knowledge, of humanity, of all the qualities, in short, that make human nature estimable. The degree in which he desires to possess power over his fellow-creatures, and the degree of oppression to which he finds motives for carrying the exercise of that power, will afford a standard from which, assuredly, there can be no appeal. Wherever the same motives exist, the same conduct, as that displayed by the English gentleman, may be expected to follow, in all men not farther advanced in human excellence than him. In the West Indies, before that vigilant attention of the English nation, which, for many years before emancipation, had imposed a check upon the masters of slaves, there was not a perfect absence of all check upon the dreadful propensities of power. But yet it is true, that these propensities led English gentlemen, not only to deprive their slaves of property, and to make property of their fellow-creatures, but to treat them with a degree of cruelty, the very description of which froze the blood of their countrymen, who were placed in less unfavourable circumstances. The motives of this deplorable conduct are exactly those which we have described above, as arising out of the universal desire to render the actions of other men exactly conformable to our will. It is of great importance to remark, that not one item in the motives which had led English gentlemen to make slaves of their fellow-creatures, and to reduce them to the very worst condition in which the negroes have been found in the West Indies, can be shown to be wanting, or to be less strong, in the set of motives which universally operate upon the men who have power over their fellow-creatures. It is proved, therefore, by the closest deduction from the acknowledged laws of human nature, and by direct and decisive experiments, that the ruling one, or the ruling few, would, if checks did not operate in the way of prevention, reduce the great mass of the people subject to their power, at least to the condition of negroes in the West Indies.[1]

We have thus seen, that of the forms of Government which have been called the three simple forms, not one is adequate to the ends which Government is appointed to secure; that the community itself, which alone is free from motives opposite to those ends, is incapacitated by its numbers from performing the business of Government; and that whether Government is intrusted to one or a few, they have not only motives opposite to those ends, but motives which will carry them, if unchecked, to inflict the greatest evils.

These conclusions are so conformable to ordinary conceptions, that it would hardly have been necessary, if the development had not been of importance for some of our subsequent investigations, to have taken any pains with the proof of them. In this country at least, it will be remarked, in conformity with so many writers, that the imperfection of the three simple forms of Government is apparent; that the ends of Government can be attained in perfection only, as under the British constitution, by an union of all the three.

V.—*That the requisite Securities are not found in a Union of the Three simple Forms of Government. Doctrine of the Constitutional Balance.*

The doctrine of the union of the three simple forms of Government is the next part of this important subject which we are called upon to examine.

The first thing which it is obvious to remark upon it is, that it has been customary, in regard to this part of the inquiry, to beg the question. The good effects which have been ascribed to the union of the three simple forms of Government, have been *supposed;* and the supposition has commonly been allowed. No proof has been adduced; or if any thing have the appearance of proof, it is the reference to the British constitution. The British constitution, it has been said, is an union of the three simple forms of Government; and the British Government is excellent. To render the instance of the British government in any degree a proof of the doctrine in question, it is evident that three points must be established; 1*st*, That the British Government is not in show, but in substance, an union of the three simple forms; 2*dly*, That it has peculiar excellence; and, 3*dly*, That its excellence arises from the union so supposed, and not from any other cause. As these points have always been taken for granted without examination, the question with respect to the effects of an union of the three simple forms of Government may be considered as yet unsolved.

The positions which we have already established with regard to human nature, and which we assume as foundations, are these: That the actions of men are governed by their wills, and their wills by their desires: That their desires are directed to pleasure and relief from pain as *ends*, and to wealth and power as the principal means: That to the desire of these means there is no limit; and that the actions which flow from this unlimited desire are the constituents whereof bad Government is made. Reasoning correctly from these acknowledged laws of human nature, we shall presently discover what opinion, with respect to the mixture of the different species of Government, it will be incumbent upon us to adopt.

The theory in question implies, that of the powers of Government, one portion is held by the king, one by the aristocracy, and one by the people. It also implies, that there is on the part of each of them a certain unity of will, otherwise they would not act as three separate powers. This being understood, we proceed to the inquiry.

From the principles which we have already laid down, it follows, that of the objects of human desire—and, speaking more definitely, of the means to the ends of human desire, namely, wealth and power—each of the three parties will endeavour to obtain as much as possible.

After what has been said, it is not suspected that any reader will deny this proposition; but it is of importance that he keep in his mind a very clear conception of it.

If any expedient presents itself to any of the supposed parties, effectual to said end, and not opposed to any preferred object of pursuit, we may infer, with certainty, that it will be adopted. One effectual expedient is not more effectual than obvious. Any two of the parties, by combining, may swallow up the third. That such combination will take place, appears to be as certain as any thing which depends upon human will; because there are strong motives in favour of it, and none that can be conceived in opposition to it. Whether the portions of power, as originally distributed to the parties, be supposed to be equal or unequal, the mixture of three of the kinds of Government, it is thus evident, cannot possibly exist.

This proposition appears to be so perfectly proved, that we do not think it necessary to dwell here upon the subject. As a part, however, of this doctrine, of the mixture of the simple forms of Government, it may be proper to inquire, whether an union may not be possible of two of them.

Three varieties of this union may be conceived; the union of the monarchy with aristocracy, or the union of either with democracy.

Let us first suppose that monarchy is united with aristocracy. Their power is equal or not equal. If it is not equal, it follows, as a necessary consequence, from the principles which we have already established, that the stronger will take from the weaker, till it engrosses the whole. The only question, therefore, is, What will happen when the power is equal?

In the first place, it seems impossible that such equality should ever exist. How is it to be established? Or by what criterion is it to be ascertained? If there is no such criterion, it must, in all cases, be the result of chance. If so, the chances against it are as infinite to one. The idea, therefore, is wholly chimerical and absurd.

Besides, a disposition to overrate one's own advantages, and underrate those of other men, is a known law of human nature. Suppose, what would be little less than miraculous, that equality were established, this propensity would lead each of the parties to conceive itself the stronger. The consequence would be, that they would go to war, and contend till one or other was subdued. Either those laws of human nature, upon which all reasoning with respect to Government proceeds, must be denied, and then the utility of Government itself may be denied, or this conclusion is demonstrated. Again, if this equality were established, is there a human being who can suppose that it would last? If any thing be known about human affairs it is this, that they are in perpetual change. If nothing else interfered, the difference of men in respect of talents would abundantly produce the effect. Suppose your equality to be established at the time when your king is a man of talents, and suppose his successor to be the reverse; your equality no longer exists. The moment one of the parties is superior, it begins to profit by its superiority, and the inequality is daily increased. It is unnecessary to extend the investigation to the remaining cases, the union of democracy with either of the other two kinds of Government. It is very evident that the same reasoning would lead to the same results.

---

[1] An acute sense of this important truth is expressed by the President Montesquieu: "C'est une expérience eternelle, que tout homme qui a du pouvoir est porté à en abuser; il va jusqu'à ce qu'il trouve des limites."—*Esprit de Loix*, ii. 4.

In this doctrine of the mixture of the simple forms of Government is included the celebrated theory of the balance among the component parts of a Government. By this it is supposed, that, when a Government is composed of monarchy, aristocracy, and democracy, they balance one another, and by mutual checks produce good Government. A few words will suffice to show, that, if any theory deserve the epithets of "wild, visionary, chimerical," it is that of the balance. If there are three powers, how is it possible to prevent two of them from combining to swallow up the third?

The analysis which we have already performed, will enable us to trace rapidly the concatenation of causes and effects in this imagined case.

We have already seen that the interest of the community, considered in the aggregate, or in the democratical point of view, is, that each individual should receive protection, and that the powers which are constituted for that purpose should be employed exclusively for that purpose. As this is a proposition wholly indisputable, it is also one to which all correct reasoning upon matters of Government must have a perpetual reference.

We have also seen that the interest of the king, and of the governing aristocracy, is directly the reverse; it is to have unlimited power over the rest of the community, and to use it for their own advantage. In the supposed case of the balance of the monarchical, aristocratical, and democratical powers, it cannot be for the interest of either the monarchy or the aristocracy to combine with the democracy; because it is the interest of the democracy, or community at large, that neither the king nor the aristocracy should have one particle of power, or one particle of the wealth of the community, for their own advantage.

The democracy or community have all possible motives to endeavour to prevent the monarchy and aristocracy from exercising power, or obtaining the wealth of the community, for their own advantage. The monarchy and aristocracy have all possible motives for endeavouring to obtain unlimited power over the persons and property of the community. The consequence is inevitable; they have all possible motives for combining to obtain that power; and unless the people have power enough to be a match for both, they have no protection. The balance, therefore, is a thing, the existence of which, upon the best possible evidence, is to be regarded as impossible. The appearances which have given colour to the supposition are altogether delusive.

VI.—*In the Representative System alone the Securities for good Government are to be found.*

What then is to be done? For, according to this reasoning, we may be told that good Government appears to be impossible. The people, as a body, cannot perform the business of Government for themselves. If the powers of Government are intrusted to one man, or a few men, and a monarchy, or governing aristocracy, is formed, the results are fatal; and it appears that a combination of the simple forms is impossible.

Notwithstanding the truth of these propositions, it is not yet proved that good Government is impossible. For though the people, who cannot exercise the powers of Government themselves, must intrust them to some one individual or set of individuals, and such individuals will infallibly have the strongest motives to make a bad use of them, it is possible that checks may be found sufficient to prevent them. The next subject of inquiry, then, is the doctrine of checks. It is sufficiently conformable to the established and fashionable opinions to say, that, upon the right constitution of checks, all goodness of Government depends. To this proposition we fully subscribe. Nothing, therefore, can exceed the importance of correct conclusions upon this subject. After the developments already made, it is hoped that the inquiry will be neither intricate nor unsatisfactory.

In the grand discovery of modern times, the system of representation, the solution of all the difficulties, both speculative and practical, will perhaps be found. If it cannot, we seem to be forced upon the extraordinary conclusion, that good Government is impossible. For as there is no individual, or combination of individuals, except the community itself, who would not have an interest in bad Government, if intrusted with its powers; and as the community itself is incapable of exercising those powers, and must intrust them to some individual or combination of individuals, the conclusion is obvious. The community itself must check those individuals, else they will follow their interest, and produce bad Government.

But how is it the community can check? The community can act only when assembled; and then it is incapable of acting.

The community, however, can choose representatives, and the question is, whether the representatives of the community can operate as a check?

VII.—*What is required in a Representative Body, to make it a security for good Government?*

We may begin by laying down two propositions, which appear to involve a great portion of the inquiry; and about which it is unlikely that there will be any dispute.

I. The checking body must have a degree of power sufficient for the business of checking.

II. It must have an identity of interest with the community; otherwise it will make a mischievous use of its power.

I. To measure the degree of power which is requisite upon any occasion, we must consider the degree of power which is necessary to be overcome. Just as much as suffices for that purpose is requisite, and no more. We have then to inquire what power it is which the representatives of the community, acting as a check, need power to overcome. The answer here is easily given. It is all that power, wheresoever lodged, which they, in whose hands it is lodged, have an interest in misusing. We have already seen, that to whomsoever the community intrusts the powers of Government, whether one, or a few, they have an interest in misusing them. All the power, therefore, which the one or the few, or which the one and the few combined, can apply to ensure the accomplishment of their sinister ends, the checking body must have power to overcome, otherwise its check will be unavailing. In other words, there will be no check.

This is so exceedingly evident, that we hardly think it necessary to say another word in illustration of it. If a king is prompted by the inherent principles of human nature to seek the gratification of his will; and if he finds an obstacle in that pursuit, he removes it, of course, if he can. If any man, or any set of men, oppose him, he overcomes them, if he is able; and to prevent him, they must, at the least, have equal power with himself.

The same is the case with an aristocracy. To oppose them with success in pursuing their interest at the expense of the community, the checking body must have power successfully to resist whatever power they possess. If there is both a king and an aristocracy, and if they would combine to put down the checking force, and to pursue their mutual interest at the expense of the community, the checking body must have sufficient power successfully to resist the united power of both king and aristocracy.

These conclusions are not only indisputable, but the very theory of the British constitution is erected upon them. The House of Commons, according to that theory, is the checking body. It is also an admitted doctrine, that if the king had the power of bearing down any opposition to his will that could be made by the House of Commons, or if the king and the House of Lords combined had the power of bearing down its opposition to their joint will, it would cease to have the power of checking them: it must, therefore, have a power sufficient to overcome the united power of both.

II. All the questions which relate to the degree of power necessary to be given to that checking body, on the perfection of whose operations all the goodness of Government depends, are thus pretty easily solved. The grand difficulty consists in finding the means of constituting a checking body, whose powers shall not be turned against the community for whose protection it is created.

There can be no doubt that if power is granted to a body of men called representatives, they, like any other men, will use their power, not for the advantage of the community, but for their own advantage, if they can. The only question is, therefore, how they can be prevented? in other words, how are the interests of the representatives to be identified with those of the community?

Each representative may be considered in two capacities; in his capacity of representative, in which he has the exercise of power over others; and in his capacity of member of the community, in which others have the exercise of power over him.

If things were so arranged, that, in his capacity of representative, it would be impossible for him to do himself so much good by misgovernment, as he would do himself harm in his capacity of member of the community, the object would be accomplished. We have already seen, that the amount of power assigned to the checking body cannot be diminished beyond a certain amount. It must be sufficient to overcome all resistance on the part of all those in whose hands the powers of Government are lodged. But if the power assigned to the representative cannot be diminished in amount, there is only one other way in which it can be diminished, and that is in duration.

This, then, is the instrument; lessening of duration is the instrument by which, if by any thing, the object is to be attained. The smaller the period of time during which any man retains his capacity of representative, as compared with the time in which he is simply a member of the community, the more difficult it will be to compensate the sacrifice of the interests of the longer period, by the profits of misgovernment during the shorter.

This is an old and approved method of identifying as nearly as possible the interests of those who rule with the interests of those who are ruled. It is in pursuance of this advantage that the members of the British House of Commons have always been chosen for a limited period. If the members were hereditary, or even if they were chosen for life, every inquirer would immediately pronounce that they would employ, for their own advantage, the powers intrusted to them; and that they would go just as far in abusing the persons and properties of the people, as their estimate of the powers and spirit of the people to resist them would allow them to contemplate as safe.

As it thus appears, by the consent of all men, from the time when the Romans made their consuls annual, down to the present day, that the end is to be attained by limiting the duration, either of the acting, or (which is better) of the checking power, the next question is, to what degree should the limitation proceed?

The general answer is plain. It should proceed, till met by overbalancing inconveniences on the other side. What then are the inconveniences which are likely to flow from a too limited duration?

They are of two sorts; those which affect the performance of the service for which the individuals are chosen, and those which arise from the trouble of election. It is sufficiently obvious, that the business of Government requires time to perform it. The matter must be proposed, deliberated upon, a resolution must be taken and executed. If the powers of Government were to be shifted from one set of hands to another every day, the business of Government could not proceed. Two conclusions, then, we may adopt with perfect certainty; that whatsoever time is necessary to perform the periodical round of the stated operations of Government, this should be allotted to those who are invested with the checking powers; and, secondly, that no time which is not necessary for that purpose should by any means be allotted to them. With respect to the inconvenience arising from frequency of election, though it is evident that the trouble of election, which is always something, should not be repeated oftener than is necessary, no great allowance will need to be made for it, because it may easily be reduced to an inconsiderable amount.

As it thus appears that limiting the duration of their power is a security against the sinister interest of the people's representatives, so it appears that it is the only security of which the nature of the case admits. The only other means which could be employed to that end would be punishment on account of abuse. It is easy, however, to see that punishment could not be effectually applied. In order to punishment, definition is required of the punishable acts; and proof must be established of the commission. But abuses of power may be carried to a great extent, without allowing the means of proving a determinate offence. No part of political experience is more perfect than this.

If the limiting of duration be the only security, it is unnecessary to speak of the importance which ought to be attached to it.

In the principle of limiting the duration of the power delegated to the representatives of the people, is not included the idea of changing them. The same individual may be chosen any number of times. The check of the short period for which he is chosen, and during which he can promote his sinister interest, is the same upon the man who has been chosen and re-chosen twenty times, as upon the man who has been chosen for the first time. And there is good reason for always re-electing the man who has done his duty, because the longer he serves, the better acquainted he becomes with the business of the service. Upon this principle of re-choosing, or of the permanency of the individual, united with the power of change, has been recommended the plan of permanent service with perpetual power of removal. This, it has been said, reduces the period within which the representative can promote his sinister interest, to the narrowest possible limits; because the moment when his constituents begin to suspect him, that moment they may turn him out. On the other hand, if he continues faithful, the trouble of election is performed once for all, and the man serves as long as he lives. Some disadvantages, on the other hand, would accompany this plan. The present, however, is not the occasion on which the balance of different plans is capable of being settled.

VII.—*What is required in the Elective Body, to secure the requisite Properties in the Representative Body.*

Having considered the means which are capable of being employed for identifying the interest of the representatives when chosen, with that of the persons who choose them, it remains that we endeavour to bring to view the principles which ought to guide in determining who the persons are by whom the act of choosing ought to be performed.

It is most evident that upon this question every thing depends. It can be of no consequence to ensure, by shortness of duration, a conformity between the conduct of the representatives and the will of those who appoint them, if those who appoint them have an interest opposite to that of the community; because those who choose will, according to the principles of human nature, make choice of such persons as will act according to their wishes. As this is a direct inference from the very principle on which Government itself is founded, we assume it as indisputable.

We have seen already, that if one man has power over others placed in his hands, he will make use of it for an evil purpose, for the purpose of rendering those other men the abject instruments of his will. If we, then, suppose that one man has the power of choosing the representatives of the people, it follows that he will choose men who will use their power as representatives for the promotion of this his sinister interest.

We have likewise seen, that when a few men have power given them over others, they will make use of it exactly for the same ends, and to the same extent, as the one man. It equally follows, that if a small number of men have the choice of the representatives, such representatives will be chosen as will promote the interests of that small number, by reducing, if possible, the rest of the community to be the abject and helpless slaves of their will.

In all these cases it is obvious and indisputable, that all the benefits of the representative system are lost. The representative system is, in that case, only an operose and clumsy machinery for doing that which might as well be done without it; reducing the community to subjection under the one or the few.

When we say the few, it is seen that in this case it is of no importance whether we mean a few hundreds or a few thousands, or even many thousands. The operation of the sinister interest is the same; and the fate is the same of all that part of the community over whom the power is exercised. A numerous aristocracy has never been found to be less oppressive than an aristocracy confined to a few.

The general conclusion, therefore, which is evidently established, is this; that the benefits of the representative system are lost, in all cases in which the interests of the choosing body are not the same with those of the community.

It is very evident, that if the community itself were the choosing body, the interest of the community and that of the choosing body would be the same. The question is, whether that of any portion of the community, if erected into the choosing body, would remain the same?

One thing is pretty clear, that all those individuals whose interests are indisputably included in those of other individuals, may be struck off without inconvenience. In this light may be viewed all children up to a certain age, whose interests are involved in those of their parents. In this light also women may be regarded, the interest of almost all of whom is involved either in that of their fathers or in that of their husbands.

Having ascertained that an interest identical with that of the whole community is to be found in the aggregate males of an age to be regarded as *sui juris*, who may be deemed the natural representatives of the whole population, we have to go on and inquire whether this requisite quality may not be found in some less number, some aliquot part of that body.

As degrees of mental qualities are not easily ascertained, outward and visible signs must be taken to distinguish, for this purpose, one part of these males from another. Applicable signs of this description appear to be three; years, property, profession or mode of life.

According to the first of these means of distinction, a portion of the males, to any degree limited, may be taken, by prescribing an advanced period of life at which the power of voting for a representative should commence. According to the second, the elective body may be limited, by allowing a vote to those only who possess a certain amount of property or of income. According to the third, they may be limited, by allowing a vote only to such persons as belong to certain professions, or certain connexions and interests. What we have to inquire is, if the interest of the number, limited and set apart, upon any of those principles, as the organ of choice for a body of representatives, will be the same with the interest of the community?

With respect to the first principle of selection, that of age, it would appear that a considerable latitude may be taken without inconvenience. Suppose the age of forty were prescribed as that at which the right of suffrage should commence, scarcely any laws could be made for the benefit of all the men of forty, which would not be laws for the benefit of all the rest of the community.

The great principle of security here is, that the men of forty have a deep interest in the welfare of the younger men; for otherwise it might be objected with perfect truth, that if decisive power were placed in the hands of men of forty years of age, they would have an interest, just as any other detached portion of the community, in pursuing that career which we have already described, for reducing the rest of the community to the state of abject slaves. But the great majority of old men have sons, whose interest they regard as an essential part of their own. This is a law of human nature. There is, therefore, no great danger that, in such an arrangement as this, the interests of the young would be greatly sacrificed to those of the old.

We come next to the inquiry, whether the interest of a body of electors, constituted by the possession of a certain amount of property or income, would be the same with the interest of the community?

It will not be disputed, that, if the qualification were raised so high that only a few hundreds possessed it, the case would be exactly the same with that of the consignment of the electoral suffrage to an aristocracy. This we have already considered, and have seen that it differs in form rather than substance from a simple aristocracy. We have likewise seen, that it alters not the case in regard to the community, whether the aristocracy be some hundreds or some thousands. One thing is, therefore, completely ascertained, that a pecuniary qualification, unless it were very low, would only create an aristocratical government, and produce all the evils which we have shown to belong to that organ of misrule.

This question, however, deserves to be a little more minutely considered. Let us next take the opposite extreme. Let us suppose that the qualification is very low, so low as to include the great majority of the people. It would not be easy for the people who have very little property, to separate their interests from those of the people who have none. It is not the interest of those who have little property to give undue advantages to the possession of property, which those who have the great portions of it would turn against themselves.

It may, therefore, be said, that there would be no evil in a low qualification. It can hardly be said, however, on the other hand, that there would be any good; for if the whole mass of the people who have some property would make a good choice, it will hardly be pretended that, added to them, the comparatively small number of those who have none, and whose minds are naturally and almost necessarily governed by the minds of those who have, would be able to make the choice a bad one.

We have ascertained, therefore, two points. We have ascertained that a very low qualification is of no use, as affording no security for a good choice, beyond that which would exist if no pecuniary qualification was required. We have likewise ascertained, that a qualification so high as to constitute an aristocracy of wealth, though it were a very numerous one, would leave the community without protection, and exposed to all the evils of unbridled power. The only question, therefore, is, whether, between these extremes, there is any qualification which would remove the right of suffrage from the people of small, or of no property, and yet constitute an elective body, the interest of which would be identical with that of the community?

It is not easy to find any satisfactory principle to guide us in our researches, and to tell us where we should fix. The qualification must either be such as to embrace the majority of the population, or some thing less than the majority. Suppose, in the first place, that it embraces the majority, the question is, whether the majority would have an interest in oppressing those who, upon this supposition, would be deprived of political power? If we reduce the calculation to its elements, we shall see that the interest which they would have, of this deplorable kind, though it would be something, would not be very great. Each man of the majority, if the majority were constituted the governing body, would have something less than the benefit of oppressing a single man. If the majority were twice as great as the minority, each man of the majority would only have one half the benefit of oppressing a single man. In that case, the benefits of good government, accruing to all, might be expected to overbalance to the several members of such an elective body the benefits of misrule peculiar to themselves. Good Government would, therefore, have a tolerable security. Suppose, in the second place, that the qualification did not admit a body of electors so large as the majority; in that case, taking again the calculation in its elements, we shall see that each man would have a benefit equal to that derived from the oppression of more than one man; and that, in proportion as the elective body constituted a smaller and smaller minority, the benefit of misrule to the elective body would be increased, and bad Government would be ensured.

It seems hardly necessary to carry the analysis of the pecuniary qualification, as the principle for choosing an elective body, any farther.

We have only remaining the third plan for constituting an elective body. According to the scheme in question, the best elective body is that which consists of certain classes, professions, or fraternities. The notion is, that when these fraternities or bodies are represented, the community itself is represented. The way in which, according to the patrons of this theory, the effect is brought about, is this. Though it is perfectly true that each of these fraternities would profit by misrule, and have the strongest interest in promoting it; yet, if three or four such fraternities are appointed to act in conjunction, they will not profit by misrule, and will have an interest in nothing but good Government.

This theory of representation we shall not attempt to trace farther back than the year 1793. In the debate on the motion of Mr, afterwards Earl Grey, for a reform in the system of representation, on the 6th of May of that year, Mr Jenkinson, afterwards Earl of Liverpool, brought forward this theory of representation, and urged it in opposition to all idea of reform in the British House of Commons, in terms as clear and distinct as those in which it has since been clothed by other leading men on both sides of that House. We shall transcribe the passage from the speech of the latter, omitting, for the sake of abbreviation, all those expressions which are unnecessary for conveying a knowledge of the plan, and of the reasons upon which it was founded.

"Supposing it agreed," he said, "that the House of Commons is meant to be a legislative body, representing all descriptions of men in the country, he supposed every person would agree that the landed interest ought to have the preponderant weight. The landed interest was, in fact, the *stamina* of the country. In the second place, in a commercial country like this, the manufacturing and commercial interest ought to have a considerable weight, secondary to the landed interest, but secondary to the landed interest only. But was this all that was necessary? There were other descriptions of people, which, to distinguish them from those already mentioned, he should style professional people, and whom he considered as absolutely necessary to the composition of a House of Commons. By professional people, he meant those members of the House of Commons who wished to raise themselves to the great offices of the state; those that were in the army, those that were in the navy, those that were in the law." He then, as a reason for desiring to have those whom he calls "professional people" in the composition of the House of Commons, gives it as a fact, that country gentlemen and merchants seldom desire, and seldom have motives for desiring, to be ministers and other great officers of state. These ministers and officers, however, ought to be made out of the House of Commons. Therefore, you ought to have "professional people" of whom to make them. Nor was this all. "There was anothor reason why these persons were absolutely necessary. We were constantly in the habit of discussing in that house all the important concerns of the state. It was necessary, therefore, that there should be persons in the practice of debating such questions." "There was a third reason, which, to his mind, was stronger than all the rest. Suppose that in that house there were only country gentlemen; they would not then be the representatives of the nation, but of the landholders. Suppose there were in that house only commercial persons; they would not be the representatives of the nation, but of the commercial interests of the nation. Suppose the landed and commercial interest could both find their way into the house; the landed interest would be able, if it had nothing but the commercial interest to combat with, to prevent that interest from having its due weight in the constitution. All descriptions of persons in the country would thus, in fact, be at the mercy of the landholders." He adds, "the professional persons are, then, what makes this house the representatives of the people. They have collectively no *esprit de corps*, and prevent any *esprit de corps* from affecting the proceedings of the house.

either the landed nor commercial interest can materially fect each other; and the interests of the different profes- ons of the country are fairly considered. The honoura- e gentleman (Mr Grey), and the petition on this table, ther proposed uniformity of election. His ideas were the verse—that the modes of election ought to be as varied possible; because, if there was but one mode of election, ere would, generally speaking, be but one description of rsons in that house; and by a varied mode of election ly could that variety be secured."

There is great vagueness undoubtedly in the language re employed, and abundant wavering and uncertainty in e ideas. But the ideas regarding this theory appear in e same half-formed state in every speech and writing in ich we have seen it adduced. The mist, indeed, by ich it has been kept surrounded alone creates the diffi- lty; because it cannot be known precisely how any thing good or bad till it is precisely known what it is.

According to the ideas of Lord Liverpool, the land- lders ought to be represented; the merchants and ma- facturers ought to be represented; the officers of the my and navy ought to be represented; and the practi- ners of the law ought to be represented. Other patrons the scheme have added, that literary men ought to be presented. And these, we believe, are almost all the aternities which have been named for this purpose by y of the advocates of representation by clubs. To en- re the choice of representatives of the landholders, ndholders must be the choosers; to ensure the choice representatives of the merchants and manufacturers, erchants and manufacturers must be the choosers; and with respect to the other fraternities, whether few or ny. Thus it must be at least in *substance*, whatever e *form* under which the visible acts may be performed. ccording to the scheme in question, these several frater- ies are represented *directly*; the rest of the community *not* represented directly; but it will be said by the pa- ons of that scheme, that it is represented *virtually*, ich, in this case, answers the same purpose.

From what has already been ascertained, it will appear rtain, that each of these fraternities has its sinister in- rest, and will be led to seek the benefit of misrule, if it able to obtain it. This is frankly and distinctly avow- by Lord Liverpool; and by those by whom it is not owed, it seems impossible to suppose that it should be sputed.

Let us now, then, observe the very principle upon ich this theory must be supported. Three, or four, or e, or more clubs of men, have unlimited power over e whole community put into their hands. These clubs ve, each and all of them, an interest, an interest the me with that which governs all other rulers, in mis- vernment, in converting the persons and properties the rest of the community wholly to their own bene- Having this interest, says the theory, they will not ke use of it, but will use all their powers for the bene- of the community. Unless this proposition can be pported, the theory is one of the shallowest by which e pretenders to political wisdom have ever exposed emselves.

Let us resume the proposition. Three, or four, or five ternities of men, composing a small part of the com- unity, have all the powers of Government placed in their nds. If they oppose and contend with one another, ey will be unable to convert these powers to their own nefit. If they agree, they will be able to convert them holly to their own benefit, and to do with the rest of the mmunity just what they please. The patrons of this stem of representation assume, that these fraternities ll be sure to take that course which is *contrary* to their erest. The course which is *according* to their interest, appears as if it had never presented itself to their imaginations.

There being two courses which the clubs may pursue, one contrary to their interest, the other agreeable to it, the patrons of the club system must prove, they must place it beyond all doubt, that the clubs will follow the first course, and not follow the second; if not, the world will laugh at a theory which is founded upon a direct contradiction of one of the fundamental principles of human nature.

In supposing that clubs or societies of men are governed, like men individually, by their interests, we are surely following a pretty complete experience. In the idea that a certain number of those clubs can unite to pursue a common interest, there is surely nothing more extraordinary, than that as many individuals should unite to pursue a common interest. Lord Liverpool talks of an *esprit de corps* belonging to a class of landholders, made up of the different bodies of landholders in every county in the kingdom. He talks of an *esprit de corps* in a class of merchants and manufacturers, made up of the different bodies of merchants and manufacturers in the several great towns and manufacturing districts in the kingdom. What, then, is meant by an *esprit de corps?* Nothing else but a union for the pursuit of a common interest. To the several clubs supposed in the present theory, a common interest is created by the very circumstance of their composing the representing and represented bodies. Unless the patrons of this theory can prove to us, contrary to all experience, that a common interest cannot create an *esprit de corps* in men in combinations, as well as in men individually, we are under the necessity of believing, that an *esprit de corps* would be formed in the classes separated from the rest of the community for the purposes of representation; that they would pursue their common interest; and inflict all the evils upon the rest of the community to which the pursuit of that interest would lead.

It is not included in the idea of this union for the pursuit of a common interest, that the clubs or sets of persons appropriated to the business of representation should totally harmonise. There would, no doubt, be a great mixture of agreement and disagreement among them. But there would, if experience is any guide, or if the general laws of human nature have any power, be sufficient agreement to prevent their losing sight of the common interest; in other words, for ensuring all that abuse of power which is useful to the parties by whom it is exercised.

The real effect of this motley representation, therefore, would only be to create a motley aristocracy; and, of course, to ensure that kind of misgovernment which it is the nature of aristocracy to produce, and to produce equally, whether it is a uniform or a variegated aristocracy; whether an aristocracy all of landowners; or an aristocracy in part landowners, in part merchants and manufacturers, in part officers of the army and navy, and in part lawyers.

We have now, therefore, examined the principles of the representative system, and have found in it all that is necessary to constitute a security for good Government. We have seen in what manner it is possible to prevent in the representatives the rise of an interest different from that of the parties who choose them, namely, by giving them little time, not dependent upon the will of those parties. We have likewise seen in what manner identity of interest may be ensured between the electoral body and the rest of the community. We have, therefore, discovered the means by which identity of interest may be ensured between the representatives and the community at large. We have, by consequence, obtained an organ of Government which possesses that quality, without which there can be no good Government.

IX.—*First Objection: That a perfect Representative System, if established, would destroy the Monarchy and the House of Lords.*

The question remains, whether this organ is competent to the performance of the whole of the business of Government? And it may be certainly answered, that it is not. It may be competent to the making of laws, and it may watch over their execution: but to the executive functions themselves, operations in detail, to be performed by individuals, it is manifestly not competent. The executive functions of Government consist of two parts, the administrative and the judicial. The administrative, in this country, belong to the king; and it will appear indubitable, that, if the best mode of disposing of the administrative powers of government be to place them in the hands of one great functionary, not elective, but hereditary; a king, such as ours, instead of being inconsistent with the representative system, in its highest state of perfection, would be an indispensable branch of a good Government; and, even if it did not previously exist, would be established by a representative body whose interests were identified, as above, with those of the nation.

The same reasoning will apply exactly to our House of Lords. Suppose it true, that, for the perfect performance of the business of legislation, and of watching over the execution of the laws, a second deliberative assembly is necessary; and that an assembly, such as the British House of Lords, composed of the proprietors of the greatest landed estates, with dignities and privileges, is the best adapted to the end: it follows, that a body of representatives, whose interests were identified with those of the nation, would establish such an assembly, if it did not previously exist: for the best of all possible reasons; that they would have motives for, and none at all against it.

Those parties, therefore, who reason against any measures necessary for identifying the interests of the representative body with those of the nation, under the plea that such a representative body would abolish the king and the House of Lords, are wholly inconsistent with themselves. They maintain that a king and a House of Lords, such as ours, are important and necessary branches of a good Government. It is demonstratively certain that a representative body, the interests of which were identified with those of the nation, would have no motive to abolish them, if they were not causes of bad Government. Those persons, therefore, who affirm that it would certainly abolish them, affirm implicitly that they are causes of bad, and not necessary to good Government. This oversight of theirs is truly surprising.

The whole of this chain of deduction is dependent, as we stated at the beginning, upon the principle that the acts of men will be conformable to their interests. Upon this principle, we conceive that the chain is complete and irrefragable. The principle, also, appears to stand upon a strong foundation. It is indisputable that the acts of men follow their will; that their will follows their desires; and that their desires are generated by their apprehensions of good or evil; in other words, by their interests.

X.—*Second Objection: That the People are not capable of acting agreeably to their Interest.*

The apprehensions of the people respecting good and evil may be just, or they may be erroneous. If just, their actions will be agreeable to their real interests. If erroneous, they will not be agreeable to their real interests, but to a false supposition of interest.

We have seen that, unless the representative body are chosen by a portion of the community, the interest of which cannot be made to differ from that of the community, the interest of the community will infallibly be sacrificed to the interest of the rulers.

The whole of that party of reasoners who support aristocratical power, affirm, that a portion of the community, the interest of whom cannot be made to differ from that of the community, will not act according to their interest, but contrary to their interest. All their pleas are grounded upon this assumption; because, if a portion of the community, whose interest is the same with that of the community, would act agreeably to their own interest, they would act agreeably to the interest of the community, and the end of Government would be obtained.

If this assumption of theirs is true, the prospect of mankind is deplorable. To the evils of misgovernment they are subject by inexorable destiny. If the powers of Government are placed in the hands of persons whose interests are not identified with those of the community, the interests of the community are wholly sacrificed to those of the rulers. If so much as a checking power is held by the community, or by any part of the community, where the interests are the same as those of the community, the holders of that checking power will not, according to the assumption in question, make use of it in a way agreeable, but in a way contrary to their own interest. According to this theory, the choice is placed between the evils which will be produced by design, the design of those who have the power of oppressing the rest of the community, and an interest in doing it; and the evils which may be produced by mistake, the mistake of those who, if they acted agreeably to their own interest, would act well.

Supposing that this theory were true, it would still be a question between these two sets of evils, whether the evils arising from the design of those who have motives to employ the powers of Government for the purpose of reducing the community to the state of abject slaves of their will, or the evils arising from the misconduct of those who never produce evil but when they mistake their own interest, are the greatest evils.

Upon the most general and summary view of this question, it appears that the proper answer cannot be doubtful. They who have a fixed invariable interest in acting ill, will act ill invariably. They who act ill from mistake, will often act well, sometimes even by accident, and in every case in which they are enabled to understand their interest, by design.

There is another, and a still more important ground of preference. The evils which are the produce of interest and power united, the evils on the one side, are altogether incurable: the effects are certain while that conjunction which is the cause of them remains. The evils which arise from mistake are not incurable; for if the parties who act contrary to their interest had a proper knowledge of that interest, they would act well. What is necessary, then, is knowledge. Knowledge, on the part of those whose interests are the same as those of the community, would be an adequate remedy. But knowledge is a thing which is capable of being increased; and the more it is increased, the more the evils on this side of the case would be reduced.

Supposing, then, the theory of will opposed to interest to be correct; the practical conclusion would be, as there is something of a remedy to the evils arising from this source, none whatever to the evils arising from the conjunction of power and sinister interest, to adopt the side which has the remedy, and to do whatever is necessary for obtaining the remedy in its greatest possible strength, and for applying it with the greatest possible efficacy.

It is no longer deniable that a high degree of knowledge is capable of being conveyed to such a portion of the community as would have interests the same with those of the community. This being the only resource for good Governmnt, those who say that it is not yet attained stand in this dimma; either they do not desire good Government, which is he case with all those who derive advantage from bad; or they will be seen employing their utmost exertions to inease the quantity of knowledge in the body of the commnity.

he practical conclusion, then, is actually the same, wether we embrace or reject the assumption that the commnity are little capable of acting according to their own inrest. That assumption, however, deserves to be consired. And it would need a more minute consideration th the space to which we are confined will enable us to bow upon it.

ne caution, first of all, we should take along with us; ar it is this, that all those persons who hold the powers of Government, without having an identity of interests with th community, and all those persons who share in the profit which are made by the abuse of those powers, and all thse persons whom the example and representations of the tw first classes influence, will be sure to represent the cmunity, or a part having an identity of interest with the cmunity, as incapable in the highest degree of acting accding to their own interest; it being clear that they who hae not an identity of interest with the community, ought tohold the power of Government no longer, if those who hae that identity of interest could be expected to act in an tolerable conformity with their interest. All representaons from that quarter, therefore, of their incapability so toct, are to be received with suspicion. They come from inrested parties; they come from parties who have the stngest possible interest to deceive themselves, and to eneavour to deceive others.

t is impossible that the interested endeavours of all those paties should not propagate, and for a long time successfy uphold, such an opinion, to whatever degree it might bound, upon accurate inquiry, to be without foundation.

parallel case may be given. It was the interest of th priesthood, when the people of Europe were all of one regon, that the laity should take their opinions exclusivelyrom them; because, in that case, the laity might be rended subservient to the will of the clergy, to any possible exent; and as all opinions were to be derived professedly frn the Bible, they withdrew from the laity the privilege of eading it. When the opinions which produced the Refnation, and all the blessings which may be traced to it, ban to ferment, the privilege of the Bible was demanded. Te demand was resisted by the clergy, upon the very sae assumption which we have now under contemplation. "he people did not understand their own interest. They wld be sure to make a bad use of the Bible. They would dve from it not right opinions, but all sorts of wrong opinns."[1]

here can be no doubt that the assumption, in the religis case, was borne out by still stronger appearance of evence than it is in the political. The majority of the pople may be supposed less capable of deriving correct opions from the Bible, than of judging who is the best m to act as a representative.

xperience has fully displayed the nature of the assumpti in regard to religion. The power bestowed upon the pele, of judging for themselves, has been productive of gd effects, to a degree which has totally altered the condin of human nature, and exalted man to what may be cad a different stage of existence.

or what reason then is it we are called upon to believe, th, if a portion of the community, having an identity of interests with the whole community, have the power of choosing representatives, they will act wholly contrary to their interests, and make a bad choice?

Experience, it will be said, establishes this conclusion. We see that the people do not act according to their interests, but very often in opposition to them.

The question is between a portion of the community, which, if intrusted with power, would have an interest in making a bad use of it, and a portion which, though intrusted with power, would not have an interest in making a bad use of it. The former are any small number whatsoever, who, by the circumstance of being intrusted with power, are constituted an aristocracy.

From the frequency, however great, with which those who compose the mass of the community act in opposition to their interests, no conclusion can, in this case, be drawn, without a comparison of the frequency with which those who are placed in contrast with them act in opposition to theirs. Now it may with great confidence be affirmed, that as great a proportion of those who compose the aristocratical body of any country, as of those who compose the rest of the community, are distinguished for a conduct unfavourable to their interests. Prudence is a more general characteristic of the people who are without the advantages of fortune, than of the people who have been thoroughly subject to their corruptive operation. It may surely be said, that if the powers of Government must be intrusted to persons incapable of good conduct, they were better intrusted to incapables who have an interest in good Government, than to incapables who have an interest in bad.

It will be said that a conclusion ought not to be drawn from the unthinking conduct of the great majority of an aristocratical body, against the capability of such a body for acting wisely in the management of public affairs; because the body will always contain a certain proportion of wise men, and the rest will be governed by them. Nothing but this can be said with pertinency, And, under certain modifications, this may be said with truth. The wise and good in any class of men do, to all general purposes, govern the rest. The comparison, however, must go on. Of that body whose interests are identified with those of the community, it may also be said, that if one portion of them are unthinking, there is another portion wise; and that, in matters of state, the less wise would be governed by the more wise, not less certainly than in that body whose interests, if they were intrusted with power, could not be identified with those of the community.

If we compare in each of these two contrasted bodies the two descriptions of persons, we shall not find that the foolish part of the democratical body are more foolish than that of the aristocratical, nor the wise part less wise.

Though, according to the opinions which fashion has propagated, it may appear a little paradoxical, we shall probably find the reverse.

That there is not only as great a proportion of wise men in that part of the community which is not the aristocracy, as in that which is, but that, under the present state of education, and the diffusion of knowledge, there is a much greater, we presume there are few persons who will be disposed to dispute. It is to be observed, that the class which is universally described as both the most wise and the most virtuous part of the community, the middle rank, are wholly included in that part of the community which is not the aristocratical. It is also not disputed, that in Great Britain the middle rank are numerous, and form a large proportion of the whole body of the people. Another proposition may be stated, with a perfect confidence in the concurrence of all those men who have attentively considered the formation of opinions in the great body of society, or, indeed, the principles of human nature in general. It is, that the opinions of that class of the people who are below the middle rank, are formed, and their minds are directed, by that intelligent and virtuous rank who come the most immediately in contact with them, who are in the constant habit of intimate communication with them, to whom they fly for advice and assistance in all their numerous difficulties, upon whom they feel an immediate and daily dependence, in health and in sickness, in infancy and in old age; to whom their children look up as models for their imitation, whose opinions they hear daily repeated, and account it their honour to adopt. There can be no doubt that the middle rank, which gives to science, to art, and to legislation itself, their most distinguished ornaments, the chief source of all that has exalted and refined human nature, is that portion of the community of which, if the basis of representation were ever so far extended, the opinion would ultimately decide. Of the people beneath them, a vast majority would be sure to be guided by their advice and example.

---

[1] A most instructive display of these and similar artifices for the preservation of mischievous power, after the spirit of the times is lt to be hostile to it, may be seen in Father Paul's *History of the Council of Trent*.

The incidents which have been urged as exceptions to this general rule, and even as reasons for rejecting it, may be considered as contributing to its proof. What signify the irregularities of a mob, more than half composed, in the greater number of instances, of boys and women, and disturbing, for a few hours or days, a particular town? What signifies the occasional turbulence of a manufacturing district, peculiarly unhappy from a very great deficiency of a middle rank, as there the population almost wholly consists of rich manufacturers and poor workmen; with whose minds no pains are taken by anybody; with whose afflictions there is no virtuous family in the middle rank to sympathize; whose children have no good example of such a family to see and to admire; and who are placed in the highly unfavourable situation of fluctuating between very high wages in one year, and very low wages in another? It is altogether futile, with regard to the foundation of good government, to say that this or the other portion of the people may at this or the other time depart from the wisdom of the middle rank. It is enough that the great majority of the people never cease to be guided by that rank; and we may, with some confidence, challenge the adversaries of the people to produce a single instance to the contrary in the history of the world.

(A. A. A.)

GOWER, John, one of the most ancient of the English poets, was contemporary with Chaucer, the father of English poetry, and his intimate friend. Of what family, or in what part of the kingdom, he was born, is uncertain. He studied the law, and was some time a member of the society of Lincoln's Inn, where his acquaintance with Chaucer commenced. Some have asserted that he was chief justice of the common pleas; but this is by no means certain. In the first year of Henry IV. he became blind; a misfortune which he laments in one of his Latin poems. He died about the year 1400, and was buried in St Mary Overy, which church he had rebuilt chiefly at his own expense. His tomb, which was magnificently and curiously ornamented, still remains, but it has been repaired in later times. From the collar round the neck of his effigy on the tomb, it is conjectured that he had been knighted. As to his character as a man, it is impossible, at this distance of time, to state any thing with certainty. With regard to his poetical talents, he was admired at the time when he wrote, though a modern reader may find it difficult to discover much harmony or genius in any of his compositions. He wrote, 1. *Speculum Meditantis, un Traitée selonc les aucteurs, pour ensampler les Amants marietz au fins qils la foy de lour seints espousailles, pourront per fine loyalté guarder, et al honeur de Dieu salvement tener*, in ten books; 2. *Vox Clamantis*, in Latin verse, a chronicle of the insurrection of the commons in the reign of Richard II., in ten books; 3. *Confessio Amantis*, printed at Westminster by Caxton in 1493, also London, 1532, 1554, a sort of poetical system of morality, interspersed with a variety of moral tales; and, 4. *De Rege Henrico IV.*, printed in Chaucer's works. There are likewise several historical tracts, in manuscript, written by Gower, which are to be found in different libraries, besides short poems printed in Chaucer's works. At a very early period Gower had become obsolete. Skelton, in the *Boke of Philip Sparrow*, says, "Gower's Englishe is old;" and, about the beginning of the sixteenth century, his language was out of use. A second edition of the *Confessio Amantis* was printed by Barthelet in 1532, a third in 1544, a fourth in 1554, and, at the distance of two centuries and a half, a fifth was published in a modern edition of the English poets. Gower was esteemed a man of great learning, and he appears to have lived and died in affluence.

GOWN, Robe, a long upper garment worn by lawyers, divines, and other graduates, who are hence called *men of the gown*, or *gownmen*. At Rome they gave the name "virile gown," *toga virilis*, to a plain kind of gown which their youth assumed on arriving at puberty. This they particularly denominated *prætexta*.

GRABE, John Ernest, a learned theologian, was born at Königsberg in the year 1666. The perusal of the works of the fathers having inspired him with doubts as to some points of his creed, he explained them in a memoir addressed to the consistory of Sambia, and departed with the resolution of repairing to a city where he could make open profession of the Catholic religion. The elector of Brandenburg ordered three theologians to examine, each separately, the memoir of Grabe; and some of the reasons contained in the answers which they made to it having struck him forcibly, he demanded a safe conduct, which was granted him, and proceeded to Berlin to confer with Speuer, one of his adversaries. Upon some of the points in dispute they came to agree; but Grabe persisting in maintaining the necessity of the apostolical succession in the ministry, Speuer, having despaired of overcoming his conviction of this doctrine, counselled him to proceed to England, where he would find it established. Grabe followed this advice, and, having reached London, got himself ordained priest according to the English ritual; but not being able to bring his belief into accordance with that of the church which he had entered, he always preserved his private opinions touching the eucharist and consecration. Nevertheless, the regularity of his conduct, and his useful labours, recommended him to notice; he obtained some benefices; and Queen Anne granted him a pension, which he enjoyed till his death, which took place at London on the 13th of September 1711, in the forty-fifth year of his age. His works, which have obtained him the reputation of a learned and laborious man, but indifferent critic, are, 1. Specilegium SS. Patrum et Hæreticorum sæculi post Christi natum primi, secundi, tertii, Oxford, 1698 and 1699, in 8vo; 2. S. Irenæi episcopi Lugdunensis adversus hæreses libri v. Oxford, 1702, in folio; 3. Vetus Testamentum juxta Septuaginta Interpretes, Oxford, 1707, 1719, 1720, and 1729, in folio; 4. Liturgia Græca, Hague, 1715, in 8vo; 5. De forma consecrationis Eucharistiæ, hoc est, Defensio Ecclesiæ Græcæ contra Romanam, London, 1721, in 8vo; 6. Editions of the First Apology of St Justin Martyr, of the works of George Bull, and of the treatise of Daubuz *pro Testimonio Flavii Josephus de Jesu Christo;* 7. Doubts presented to the Consistory of Sambia, in German, two writings in English against Whiston, and some polemical pieces of little importance. (A.)

GRACCHUS, Tiberius Sempronius, the son of Tiberius Gracchus, who had been censor, twice consul, and had triumphed twice. His mother was the celebrated Cornelia, daughter of Scipio Africanus the Elder, and she was left by the death of her husband with the charge of no fewer than twelve children. She lost all except three; one daughter, married to Scipio the Younger, and two sons, Caius and Tiberius. Tiberius was born about 163 B.C. and was murdered 133 B.C. He began early to exhibit proofs of great talents, and his mother appears to have cultivated his mind by every means in her power. He was distinguished from his brother Caius by his mildness of manner and the dignity of his deportment. The language of Tiberius was chaste and polished; that of Caius exhibited more of pretension and splendour. The two brothers, however, were equally attentive to their duties as magistrates, and in their self-government in respect to pleasure they were perfectly alike. Tiberius served his first campaign under Scipio the Younger in Africa (B.C. 146), and made himself much beloved by the army. He was some time afterwards (B.C. 137) appointed quæstor, and attended the consul C. Mancinus in the Numantine war. This consul was one of the most unfortunate generals the Romans ever had, and conducted matters so ill that he and his whole army were obliged to submit to conditions of peace imposed by the Numantians. That people refused to treat with any one except Tiberius Gracchus, and he was employed to draw up the articles of peace. The peace, however, was disavowed at Rome, and Mancinus was delivered up to the Numantians naked and in chains. Tiberius was spared, chiefly through the interest and influence of Scipio, his brother-in-law. It was now that Tiberius entered on the stormy path of politics, and the measure which he first advocated was of a magnitude suited to the part he intended to act in the affairs of his country. It was to restrain the avarice of the rich, and to compel them to give up the possession of the public lands, of which they had unjustly become masters. Caius Lælius, the friend of Scipio, had attempted to correct this disorder; but, frightened by the opposition of men in power, he gave up the undertaking. No sooner, however, had Tiberius been elected tribune of the people, than he determined to make an attempt to restore their share of the public lands to the poor. No law could have been of a milder nature than that which he proposed to introduce; for, instead of punishing those who had infringed the rights of the community, they were to receive a sum of money for foregoing their groundless claims. Nothing, however, could induce the rich to listen for a moment to the proposal; and, like all reformers of abuses, he was accused of attempting to throw the country into disorder, and to subvert the constitution of the state. Incensed at this, Tiberius no longer kept on terms with his opponents, but proposed another law of a severer character, which commanded all to quit the lands which they held contrary to law. This law was confirmed by the people, and three commissioners were appointed to survey the public domain. Tiberius, his brother Caius, and his father-in-law Appius Claudius, received orders to make the survey. If he had contented himself with the passing of this measure, we should have regarded him as a patriot rather than a demagogue; but his position had now become so critical, and his enemies so numerous, that he was urged forward in his career by a regard to his own personal safety rather than by a reference to the good of the republic. In retiring to a private station he would have been exposed to the vengeance of his enemies, and he could not expect to be re-elected tribune, unless by some new proof of his devotion to the popular cause. He therefore proposed laws for shortening the time of military service, and for granting an appeal from the judges to the people. As the bench of judges consisted entirely of senators, he proposed that an equal number of knights and senators should be admitted. On the day when these laws were to be put to the vote, his opponents resolved to create a disturbance, during which they would have an opportunity of putting him to death. Tiberius became acquainted with it during the meeting of the assembly, and as there was great clamour, he had no other way of communicating the information than by touching his head with his hand, to signify the danger he was in. Some one ran to the senate and informed them that Tiberius had demanded a diadem of the people. This excited a great commotion in the senate, and Scipio Nasica rushed out with numerous attendants, and having put the people to flight, killed Tiberius in the Forum. (Plutarch, *Life of Tiberius Gracchus;* Liv. *Epit.* 58.)

Gracchus, *Caius Sempronius*, was nine years younger than his elder brother Tiberius, having been born in the year B.C. 154. He had as yet taken no part in public affairs when his brother was murdered, but he soon showed that he did not intend to lead a life of idleness. He cultivated his powers of eloquence, and the senate began to have apprehensions of his succeeding to the power of his brother. They were not therefore sorry when he was appointed quæstor to the consul Aurelius Orestes, B.C. 126, in Sardinia, as it took him away from Rome. He became so great a favourite with the inhabitants of Sardinia, that though they had obtained from the senate an exemption from the burden of clothing his men, he had so much influence with them, that he prevailed on them to send a voluntary supply. On his return to Rome, whither he repaired contrary to orders, he offered himself a candidate for the tribuneship, and was elected B.C. 123, against the wishes of the nobility. He now brought forward a number of laws to increase the authority of the people, of a nature similar to those which his brother had advocated. He proposed to divide the public lands among the poor, to clothe the soldiers at the public expense, without diminution of their pay, and to give to the Italian allies the right of voting at elections; but his most important measure was, that he took the judicial authority from the patricians, and conferred it on the equestrian order. He took great interest also in the constructing of public roads through Italy, and building granaries. He kept up his influence amongst the people by sending colonies of the poorer citizens to Tarentum and Capua; but the senate, fearing that his power would soon no longer be capable of being controlled, tried to draw the people from him by gratifying them in every thing. Caius however was appointed tribune a second time (B.C. 122), without even declaring himself a candidate, and proceeded to Africa to plant a colony at Carthage. During his absence one of his colleagues, Drusus, succeeded in gaining the favour of the people; and this induced Caius to hasten home. The following year the consul Opimius determined to repeal many of the laws which had been passed by Caius; and as the party of the latter mustered in great force, and that of the consul was equally resolute, an engagement took place, in which the friends of Caius were defeated, and he himself killed, to the great grief of the Roman people, whose interests he had laboured to promote. (Plutarch, *Life of Caius Gracchus;* Liv. *Epit.* 60, 61.)

GRACE, amongst divines, is used, first, to denote the free love and favour of God, which is the spring and source of all the benefits we receive from him; and, secondly, to signify the work of the Spirit in renewing the soul after the image of God, and continually guiding and strengthening the believer to obey his will, to resist sin, and to overcome it.

Grace is also used, in a peculiar sense, to signify a short prayer said before and after meat.

The proofs of the moral obligation of this ceremony, drawn from passages in the New Testament, are so well known that it is needless to insist on them. But others, derived from the practice of different nations, and of remote antiquity, may not be uninteresting.

1. Athenæus tells us, in his Deipnosophist (lib. ii.), that in the famous regulation made by Amphictyon, king of Athens, respecting the use of wine, both in sacrifices and at home, he required that the name of Jupiter the Sustainer should be decently and reverently pronounced. The same writer (lib. iv. p. 149) quotes Hermeias, an author extant in his time, who mentions a people in Egypt, inhabitants of the city of Naucratis, whose custom it was on certain occasions, after they had placed themselves in the usual posture of eating at table, to rise again and kneel, upon which the priest or precentor of the solemnity began to chant a grace, according to a stated form amongst them; and when that was over, they joined in the meal in a solemn sacrificial manner. Heliodorus has a passage to the same purpose in his *Æthiopica*, where it is stated that it was the custom of the Egyptian philosophers to pour out libations and utter ejaculations before they sat down to meals. Porphyry (in his treatise *De Abstinentia*, lib. iv. p. 408) gives a high character of the Samnean gymnosophists in Egypt for the strictness of their lives; and, as one circumstance in their favour, he observes, that at the sounding of a bell before their meals, which consisted only of rice, bread, fruits, and herbs, they went to prayers; that when these were ended, and not before, the bell again sounded, and they sat down to eat. This religious usage or rite was also common amongst the ancient Greeks, and, if Clement of Alexandria rightly informs us, it was derived from yet older times. He mentions that this people, when they met together to refresh themselves with the juice of the grape, sung a piece of music, in imitation of the Hebrew psalms, which they called a scholion. Livy (lib. xxxix.) likewise speaks of it as a settled custom amongst the old Romans, that they offered sacrifice and prayer to the gods at their meals and compotations. But one of the fullest testimonies to our purpose is given by Quintilian (*Declam.* 301): *Adisti mensam*, says he, *ad quam cum venire cœpimus, Deos invocamus.*

Trigautius, in his elegant and instructive narrative of the expedition of the Jesuit missionaries into China (book i. p. 69), gives this account of the people of that country in the particular now under consideration. “ Before they place themselves for partaking of an entertainment, the person who makes it sets a vessel, either of gold, or silver, or marble, or some such valuable material, in a charger full of wine, which he holds with both his hands, and then makes a low bow to the person of chief quality or character at the table. Then from the hall or dining-room he goes into the porch or entry, where he again makes a very low bow, and turning his face to the south, pours out this wine upon the ground as a thankful oblation to the Lord of heaven. After this, repeating his reverential obeisance, he returns into the hall.” The Turks also pray for a blessing on their meat; and many more instances might be produced of infidels who constantly observe the same custom in some way or other.

2. The fact, therefore, with respect to the heathen world being thus evident, we proceed to notice the sentiments and conduct of the Jews in this particular. Their historian Josephus, giving a detail of the rites and customs of the Essenes, who were confessedly the strictest and most pious professors of the Jewish religion, has this remarkable passage: “ The priest,” says he, “ prays for a blessing before they presume to take any nourishment; and it is looked upon as a great sin to take or taste before.” Then follows the thanksgiving after meat. “ When the meal,” he proceeds, “ is over, the priest prays again; and the company with him bless and praise God as their preserver, and the giver of their life and nourishment.”

But Philo, in his book *De Vita Contemplativa*, gives an account of a body of men and women stricter than even the Essenes. He distinguishes them by no particular name, though his relation is minute and circumstantial; namely, that on certain special occasions, before “ they took their meals, they placed themselves in a proper decent order, when, lifting up their hands and eyes to heaven, they prayed to God that he would be pleased to be propitious to them in the use of those his good creatures.”

It appears, from the Hebrew ritual, that the Jews had their hymns and psalms of thanksgiving, not only after eating their passover, but on a variety of other occasions, at and after meals, and even between their several courses and dishes; as when the best of their wine was brought upon the table, or their aromatic confections, or the fruits of the garden, or the like. Upon the day of the passover was sung the 114th psalm, “ When Israel went out of Egypt.”

Aristæus has also a passage on the same subject. “ Moses,” says he, “ commands that when the Jews are going to eat or drink, the company should immediately join in sacrifice or prayer.” It is doubtful where Rabbi Eleazar found this sentence, and its genuineness has been controverted. But supposing it not to be found *in scriptis*, it is sufficient to know that the Jews constantly practised this custom, upon the foundation of an ancient tradition and general usage. That the prophet Daniel gave thanks before meat is evident from the Apocryphal book concerning Bel and the Dragon, where (verses 38, 39) we find that “ Daniel said, Thou hast remembered me, O God, neither hast thou forsaken them who seek thee and love thee; so Daniel arose, and did eat.” Of this text Prudentia takes notice in Cathemirin (hymn iv.):

His sumptis Danielis excitavit
In cœlum faciem, ciboque fortis,
Amen reddidit, allelujah dixit.

It may be observed by the way, that the poet is a little mistaken in making the prophet give thanks after meat; for, according to the text, he did so before.

GRACES, Gratiæ, *Charites*, in the heathen theology, were fabulous deities, three in number, who attended on Venus. Their names were, Aglaia, Thalia, and Euphrosyne; or, according to some authors, Pasithea, Euphrosyne, and Ægiale. They were supposed by some to be the daughters of Jupiter and Eurynome, and by others to be the daughters of Bacchus and Venus. Some suppose the Graces to have been four in number; and make them the same with the *Horæ* or Hours, or rather with the four seasons of the year. A marble in the king of Prussia's cabinet represents the three Graces in the usual manner, with a fourth seated and covered with a large veil, having underneath the words *Ad Sorores* IIII. But this group we may understand to be the three Graces, and Venus, who was their sister, as being daughter of Jupiter and Dione. The Graces were always supposed to hold one another by the hands, and never to have parted. They were painted naked, to show that they borrowed nothing from art, and that they had no other beauties than such as were purely natural. Yet in the first ages they were not represented naked, as appears from Pausanias (lib. vi. and ix.), who describes their temple and statues. They were f wood, all but the head, the feet, and the hands, which ere of white marble. Their robe or gown was gilt; and ne of them held in her hand a rose, another a dye, and he third a sprig of myrtle.

GRÆVIUS, the Latinized form of GRÆFE, JOHN EORGE, one of the most learned and laborious writers of s time, was born at Naumburg, in Saxony, on the 29th January 1632. He began his studies in the gymnaum of Pforta, and completed them at the university of eipsic, under Rivinus and Strauch. Grævius was led to e study of letters by his natural inclination, and every y he became more and more devoted to this pursuit. ut his father wished that he should study the law; rauch seconded this view; and Grævius obeyed, though ith repugnance. About the same time it happened that s father had occasion to send him into East Friesland accelerate the payment of a considerable debt. This urney fixed the destination of Grævius. Having sucssfully accomplished the object of his mission, he had e curiosity to visit Holland, where Salmasius, Heinsius, d Frederick Gronovius, were then in the zenith of their putation. The conversation of Gronovius revealed to m the painful truth that his studies had been almost enrely unavailing, that he had been taught according to the inciples of a bad school, and that he had no time to lose he desired to correct the vices of its method of instruc-on. At this period the taste in Latinity had been corpted in almost all the German universities. Justus Lipus had first set the example. Despairing of ever attaing the classical elegance of Manucius, Muretus, and a small mber of other learned men of their age, he had abanned their model, Cicero, and betaken himself to the imition of some writers of an inferior order, who belonged t to the golden age of the Latin language. In a man of ch merit as Justus Lipsius this was a temerity excused rhaps by other qualities of a superior order; in his imitors it implied the total absence of reason and taste. In e rudeness of Ennius, amongst the rugged archaisms of cuvius, and the ignoble trivialities of Plautus, they went seek for words and phrases, which they accommodated all subjects, even the gravest. They affected ridiculous nts, and certain finesses of thought, by which all the viur of the style was enervated; and they cut down into all periods, of studied brevity, a language already rened meagre and dry. Grævius, ill directed, had entered on the same evil path. But he entreated Gronovius to come thenceforth his guide, nor could he have chosen e more able; so, having abandoned jurisprudence, he ssed two years at Deventer, attending assiduously the sons of his new master. He then proceeded to Amstern to hear Alexander Morus and David Blondel, whose unsels decided him to quit Lutheranism for the sect of vin. Peter Burmann, his panegyrist, anxious that this ange of religion should not be misrepresented, declares t it did not proceed from interested motives, and that new convert listened only to the voice of his conence. Grævius, whose reputation had now begun to be ended, was, in 1656, called to the university of Duisg; and he had been there two years, surpassing all the pes which had been conceived of his talents, when onovius, who had entered the university of Leyden, cited the magistrates of Deventer to appoint Grævius successor. They agreed to this application, and Græs, notwithstanding the efforts of the elector of Branburg, who, in order to retain him, offered an augmenon of fees, quitted an university for a simple gymnan, influenced probably by the desire of living under a government. After a stay of three years at Deventhe yielded to the solicitations of the university of echt, which offered him the chair of history, then vacant he death of Æmilius. This satisfied all his ambition, and, content with his situation, he declined the invitations of the magistrates of Amsterdam and Leyden, who twice attempted, by brilliant offers, to attach him to the schools in those cities. The elector palatine, who wished to draw him to Heidelberg, was also refused; the king of Prussia was not more fortunate; and the republic of Venice, which offered him a chair in the university of Padua, had as little success, although, in the hope of inducing him to accept, it had promised him, besides considerable appointments, full liberty on the score of religion, and all necessary protection against the importunity of the inquisitors. But none of these offers could overcome his resolution. The eager desire of foreigners to obtain his services was justified by the great reputation which he had attained as professor. Pupils crowded to his lectures, not only from all Holland, but from all Europe. In Germany, particularly, almost all the great lords sent their sons to be educated by him; and he reckoned amongst his auditors sons of princes, and even of kings; for William III., who made him his historiographer, had confided to his care the young Prince of Nassau. To the reputation of a great professor Grævius joined that of a learned writer and able critic. Paquot, and before him G. Burmann in the *Trajectum Eruditum*, have given a complete list of his works. The principal are, 1. An edition of the Letters of Casaubon, Brunswick, 1655; 2. The Solecist of Lucian, Amsterdam, 1668, in 8vo, with notes rich in grammatical erudition; 3. Hesiod, with a collection of excellent observations under the title of *Lectiones Hesiodeæ;* 4. Justin, 1669, *cum Notis Variorum;* 5. Catullus, Tibullus, and Propertius, Utrecht, 1680, *cum Notis Variorum*; 6. Suetonius, 1672; 7. Florus, 1680; 8. The Commentaries of Cæsar; 9. The miscellaneous Letters of Cicero, his Letters to Atticus, his Treatise of Offices, and his Discourses, *cum Notis Variorum.* But his masterpiece is his *Thesaurus Antiquitatum Romanarum*, in 12 vols. folio, a work of incredible labour and research, to which he afterwards added *Thesaurus Antiq. et Hist. Italiæ*, printed the year after his death, 1704, in 3 vols. folio, and continued by his successor Peter Burmann. Besides all these works, which are more than sufficient to have exhausted the industry of ten ordinary men, Grævius edited the Philological Lexicon of Martinus, the treatise of Junius *De Pictura Veterum*, the Greek and Latin Poetry of Huet, and several works of Meursius; and, in concert with Peter Burmann and Holthen, he had commenced a reimpression of the Inscriptions of Gruter. But in the midst of his labours death surprised this indefatigable scholar, who was suddenly carried off by an attack of apoplexy, on the 11th of January 1703, in the seventy-first year of his age. Fabricius has published a collection of his Prefaces and Letters, and Burmann a collection of his Discourses. (A.)

GRAFTING, or ENGRAFTING, in *Gardening*, is the taking a shoot from one tree, and inserting it into another, in such a manner that both may unite closely and become one tree. By the ancient writers on husbandry and gardening, this operation is called *incision*, to distinguish it from inoculation or budding, which they call *inserere oculos.*

GRAHAM, JAMES, Marquis of Montrose, a man celebrated by one party as a hero comparable to the greatest of antiquity, and branded by another as a renegade and a traitor. His name, his exploits, and his character belong properly to history (see the article BRITAIN); but he deserves notice here as one who occupied his intervals of leisure, few and far between, with the elegant and peaceful pursuits of literature. Such of his poems as have been preserved, though they possess but little merit in themselves, are remarkable as the effusions of a mind in which the most heroic and chivalrous daring seems to have been attempered by a degree of refinement beyond his age, and a capacity for pursuits less dazzling, but far more innocent and useful, than those which have shed an equivocal lustre on his name. His desertion of the covenanters may perhaps be excused, but cannot be defended; amidst the conflicts of exasperated parties and the excitement of civil commotion, it is not easy to steer a consistent and blameless course; but the laws of honour and morality are nevertheless unchangeable. Having joined the royal cause, however, he devoted himself to promote its success; and if his caution had been equal to his genius, or if he had been provided with the necessary supplies, he would in all probability have reduced the kingdom of Scotland to the necessity of acknowledging the royal authority. But, from want of means, his conquests were lost almost as soon as gained; victory produced him no solid advantage; and the first reverse he experienced proved his ruin. His second attempt, after the death of Charles I., was accordingly hopeless from the commencement; he was completely defeated by the army sent against him; and, being betrayed into the hands of the enemy by the laird of Assynt, his intimate friend, he was carried to Edinburgh, and executed with every circumstance of indignity, on the 21st of May 1650. His exploits made him a hero, and to this his enemies added the distinction of martyrdom. Considered as a commander, Montrose was merely a bold and active partisan; a sort of guerilla chief, whose services would have been invaluable to the party he had espoused, if there had been in the field a regular force with which he could have connected his operations, but who, acting independently, contributed merely to aggravate the evils of the contest, without in the slightest degree affecting its result.

Graham, *Sir Richard*, Lord Viscount Preston, eldest son of Sir George Graham of Netherby, in Cumberland, was born in the year 1648. He was sent by Charles II. as ambassador to Louis XIV., and was master of the wardrobe and secretary of state under James II. But when the revolution took place, he was tried and condemned, on a charge of attempting the restoration of that prince; and although he obtained a pardon by the queen's intercession, he spent the remainder of his days in retirement. He published an elegant translation of Boethius on the Consolations of Philosophy, and died in 1695.

Graham, *George*, clock and watch-maker, the most ingenious and accurate artist of his time, was born in 1675. After his apprenticeship, Mr Tompion received him into his family on account of his merit, and treated him with a kind of parental affection as long as he lived. Besides his universally acknowledged skill in his profession, he was a complete mechanic and astronomer; the great mural arch in the observatory at Greenwich was made for Dr Halley, under his immediate inspection, and divided by his own hand; and from this incomparable original, the best foreign instruments of the kind were copied by English artists. The sector by which Dr Bradley first discovered two new motions in the fixed stars was of his invention and construction; and when the French academicians were sent to measure a degree of the meridian in Lapland, with the view of determining the figure of the earth, Mr Graham was considered the fittest person in Europe to supply them with instruments. He was for many years a member of the Royal Society, to which he communicated several ingenious and important discoveries. He died in 1751.

GRAMINA, **Grasses**, one of the seven tribes or natural families, into which all vegetables are distributed by Linnæus in his *Philosophia Botanica*. They are defined to be plants which have very simple leaves, a jointed stem, a husky calyx termed *gluma*, and a single seed.

GRAMMAR.

Grammar is the art of speaking or writing any language with correctness and propriety; and the purpose of language is to communicate our thoughts.

Grammar, considered as an art, necessarily supposes the previous existence of language; and as its design is to teach any language to those who are ignorant of it, it must be adapted to the genius of that particular language of which it treats. A just method of grammar, therefore, without attempting any alterations in a language already introduced, furnishes certain observations called rules, to which the methods of speaking used in that language may be reduced; and this collection of rules is called the *grammar* of that particular language. For the greater distinctness with regard to these rules, grammarians have usually divided this subject into four distinct heads: *Orthography*, or the art of combining letters into syllables, and syllables into words; *Etymology*, or the art of deducing one word from another, and the various modifications by which the sense of any one word can be diversified consistently with its original meaning or its relation to the theme whence it is derived; *Syntax*, or what relates to the construction or due disposition of the words of a language into sentences or phrases; and *Prosody*, or that which treats of the quantities and accents of syllables, and the art of making verses.

But grammar, considered as a science, views language only as significant of thought. Neglecting particular and arbitrary modifications introduced for the sake of beauty or elegance, it examines the analogy and relation between words and ideas; distinguishes between those particulars which are essential to language and those which are only accidental; and thus furnishes a certain standard, by which different languages may be compared, and their several excellencies or defects pointed out. This is what is called **Philosophical or**

UNIVERSAL GRAMMAR.

The origin of language is a subject which has employed much learned investigation, and about which there is still a diversity of opinion. The design of speech is to communicate to others the thoughts and perceptions of the mind of the speaker; but it is obvious, that between an internal idea and any external sound there is no natural relation; that the word *fire*, for instance, might have denominated the substance which we call *ice*, and that the word *ice* might have signified *fire*. Some of the most acute feelings of man, as well as of every other animal, are indeed expressed by simple inarticulate sounds, which, as they tend to the preservation of the individual, or the continuance of the species, and invariably indicate either pain or pleasure, are universally understood; but these inarticulate and significant sounds are very few in number; and if they can with any propriety be said to constitute a natural and universal language, it is a language of which man as a mere sensitive being partakes in common with the other animals.

Man is endowed not only with sensation, but also with the faculty of reasoning; and simple inarticulate sounds are insufficient for expressing all the various modifications thought, for communicating to others a chain of argu-entation, or even for distinguishing between the different nsations either of pain or of pleasure; a man scorched th fire or unexpectedly plunged amongst ice, might utter e cry naturally indicative of sudden and violent pain; e cry would be the same, or nearly the same, but the nsations of cold and heat are widely different. Articula-n, by which those simple sounds are modified, and a par-ular meaning fixed to each modification, is therefore ab-utely necessary to such a being as man, and forms the nguage which distinguishes him from all other animals, d enables him to communicate with facility all that di-rsity of ideas with which his mind is stored, to make own his particular wants, and to distinguish with accu-cy all his various sensations. Those sounds thus modi-d are called *words;* and as words have confessedly no tural relation to the ideas and perceptions of which they e significant, the use of them must either have been the sult of human sagacity, or have been suggested to the st man by the author of nature.

Whether language be of divine or human origin, is a estion upon which, though it might perhaps be soon re-lved, it is not necessary to enter here. Upon either sup-sition, the first language, compared with those which cceeded it, or even with itself as afterwards enlarged, st have been extremely narrow and rude. If it was of man contrivance, this will be readily granted; for what t was ever invented and brought to a state of perfection illiterate savages? If it was taught by God, which is least the more probable supposition, we cannot imagine at it would be more comprehensive than the ideas of ose for whose immediate use it was intended; that the st men should have been taught to express pains or plea-res which they never felt, or to utter sounds that should terwards be significant of ideas which at the time of ut-rance had not occurred to the mind of the speaker. Man ce taught the elements of language would be able of him-lf to improve and enlarge it as his future occasions re-ired.

As all language is composed of significant words vari-sly combined, a knowledge of them is necessary previous our acquiring an adequate idea of language as con-ucted into sentences and phrases. But as it is by words at we express the various ideas which occur to the mind, is necessary to examine how ideas themselves are sug-sted, before we can ascertain the various classes into ich words may be distributed. It is the province of *gic* to trace our ideas from their origin, as well as to fold the process of reasoning; but it is necessary at esent to observe, that our earliest ideas are all ideas of nsation, excited by the impressions that are made upon r organs of sense by the various objects with which we e surrounded. Let us therefore suppose a reasonable ing, devoid of every possible prepossession, placed upon is globe; and it is obvious that his attention would in e first place be directed to the various objects which he w existing around him. These he would naturally en-avour to distinguish from one another; and if he were ther learning or inventing a language, his first effort would to give them *names*, by means of which the ideas of em might be recalled when the objects themselves should absent. This is one copious source of words, and forms natural class which must be common to every language, and which is distinguished by the name of *nouns;* and as these nouns are the names of the several substances which exist, they have likewise been called *substantives.*

It would likewise be early discovered that every one of these substances was endowed with certain qualities or attributes, to express which another class of words would be requisite, since it is only by their qualities that substances themselves can attract our attention. Thus, to be weighty, is a quality of matter; to think, is an attribute of man. Therefore in every language words have been invented to express the known qualities or attributes of the several objects which exist. These may all be comprehended under the general denomination of *attributives.*

Nouns and attributives must comprehend all that is essential to language;[1] for every thing which exists, or of which we can form an idea, must be either a substance or the attribute of some substance; and therefore the two classes which we denominate substances and attributes must comprehend all the words that are necessary to communicate to the hearer the ideas which are present to the mind of the speaker. If any other words occur, they can only have been invented for the sake of dispatch, or introduced for the purposes of ease and ornament, to avoid tedious circumlocutions or disagreeable tautologies. There are indeed grammarians of great name, who have considered as essential to language an order of words, of which the use is to connect the nouns and attributes, and which are said to have no signification of themselves, but to become significant by relation. Hence all words which can possibly be invented are by these men divided into two general classes; those which are *significant of themselves*, and those which are *not.* Words significant of themselves are either expressive of the names of substances, and therefore called *substantives;* or of attributes, and therefore called *attributives.* Words which are not significant of themselves must acquire a meaning either as defining or connecting others, and are therefore arranged under the two classes of *definitives* and *connectives.*

That in any language there can be words which of themselves have no signification, is a supposition which a man free from prejudice will not readily admit. For to what purpose, we ask, should they have been invented? As they are significant of no ideas, they cannot facilitate the communication of thought, and must therefore be only an incumbrance to the language in which they are found. But in answer to this it has been said, that these words, though devoid of signification themselves, acquire a sort of meaning when joined with others, and that they are as necessary to the structure of a sentence as mortar is to the structure of an edifice; for as stones cannot be arranged into a regular building without a cement to bind and connect them, so the original words significant of substances and attributes cannot be made to express all the variety of our ideas without being defined and connected by those words which of themselves signify nothing. It is wonderful that he who first suggested this simile did not perceive that it tends to overthrow the doctrine which it is meant to illustrate. For surely the cement is as much the matter of the building as the stones themselves are; it is equally solid and equally extended. By being united with the stones, it neither acquires nor loses any one of the qualities essential to matter; it neither communicates its own softness nor acquires their hardness. By this mode of reasoning, therefore, it would appear that the words called definitives and connectives, so far from having of themselves no signification, are equally essential to language, and equally significant with those which are denominated substantives and attributives; and upon investigation it will be found that this is the truth. For whatever is meant by the definition or connection of the words which all men confess to be significant, that meaning must be the sense of the words of which the purpose is to define and connect; and as there can be no meaning where there are no ideas, every one of these definitives and connectives must be significant of some idea, although it may not always be easy or even possible to express that idea by another word.

---

[1] This is the doctrine of many writers on the theory of language; yet it is not easy to conceive mankind so far advanced in the t of abstraction as to view *attributes* by themselves independently of particular *substances*, and to give one general name to each attri-te wheresoever it may be found, without having at the same time words expressive of affirmation. We never talk of any attri-te, a colour for instance, without affirming something concerning it; as, either that it is bright or faint, or that it is the colour of me substance. It will be seen afterwards, that to denote affirmation is the proper office of what is called the substantive verb; , "Milk is white." That verb therefore appears to be as necessary to the communication of thought as any species of words whatever; and if we must range words under a few general classes, we should be inclined to say that nouns, attributes, and affirma-ves, comprehend all that is really essential to language.

These different modes of dividing the parts of speech we have just mentioned because they have been largely treated of by grammarians of high fame. But it does not appear to us that any man can feel himself much the wiser for having learned that all words are either substantives or attributives, definitives or connectives. The division of words into those which are *significant of themselves*, and those which are *significant by relation*, is absolute nonsense, and has been productive of much error and much mystery in some of the most celebrated treatises on grammar. It is indeed probable that any attempt to establish a different classification of the parts of speech from that which is commonly received, will be found of little utility either in practice or in speculation. As far as the former is concerned, the vulgar division seems sufficiently commodious; for every man who knows any thing, knows when he uses a noun and when a verb. With respect to the latter, not to mention that all the grammarians from Aristotle to Horne Tooke have differed on the subject, it should seem to be of more importance, after having ascertained with precision the nature of each species of words, to determine in what circumstances they differ than in what they agree.

In most languages, probably in all cultivated languages, grammarians distinguish the following parts of speech, viz. noun, pronoun, verb, participle, adverb, preposition, conjunction. The Latin and English grammarians admit the interjection among the parts of speech, although it is confessedly not necessary to the construction of the sentence, being only thrown in to express the affection of the speaker; and in the Greek and English tongues there is the article prefixed to nouns when they signify the common names of things, to point them out, and to show how far their signification extends. In the method of arrangement commonly followed in grammars, adjectives are classed with substantives, and both are denominated nouns. But it is certain that, when examined philosophically, an essential difference is discovered between the substantive and the adjective; and therefore some philologists of eminence, when treating of this subject, have given the following classification of words, which we shall adopt: The ARTICLE, NOUN, PRONOUN, VERB, PARTICIPLE, ADJECTIVE, ADVERB, PREPOSITION, CONJUNCTION, INTERJECTION. All these words are to be found in the English language, and therefore we shall examine each class, endeavour to ascertain its precise import, and show in what respects it differs from every other class. It is impossible to investigate the principles of grammar without confining the investigation in a great measure to some particular language from which the illustrations must be produced; and that we should prefer the English language for this purpose can excite no wonder, as it is a preference which is due to every tongue from those by whom it is spoken. The principles, however, which we shall here expound and elucidate, being in substance the same with those so clearly and ingeniously established by Dr John Hunter of St Andrews, in his oral prelections on philology, will be found to apply universally; and our inquiry, though principally illustrated from the English language, will be an inquiry into Philosophical and Universal Grammar.

I. *Of the Noun or Substantive.*

Nouns.

Nouns are all those words by which objects or substances are denominated, and which distinguish them from one another, without marking either quantity, quality, action, or relation. The substantive or noun is the name of the thing spoken of, and in Greek and Latin is called *name;* for it is *ονομα* in the one, and *nomen* in the other; and if in English we had called it the *name* rather than the *noun*, the appellation would perhaps have been more proper, as this last word, being used only in grammar, is more liable to be misunderstood than the other, which is in constant and familiar use. That nouns or the names of things must make a part of every language, and that they must have been the words first suggested to the human mind, will not be disputed. Men could not speak of themselves, or of any thing else, without having names for themselves and the various objects with which they are surrounded. Now, as all the objects which exist must be either in the same state in which they were produced by nature, or changed from their original state by art, or abstracted from substances by the powers of imagination, and conceived by the mind as having at least the capacity of being characterised by qualities; this naturally suggests a division of nouns into *natural*, as man, vegetable, tree; *artificial*, as house, ship, watch; and *abstract*, as whiteness, motion, temperance.

But the diversity of objects is so great, that had each individual a distinct and proper name, it would be impossible for the most tenacious memory, during the course of the longest life, to retain even the nouns of the narrowest language. It has therefore been found expedient, when a number of things resemble each other in some important particulars, to arrange them all under one *species;* to which is given a name that belongs equally to the whole species, and to each individual comprehended under it. Thus the word *man* denotes a *species* of animals, and is equally applicable to every human being; the word *horse* denotes another species of animals, and is equally applicable to every individual of that species of *quadrupeds;* but it cannot be applied to the species of men, or to any individual comprehended under that species. We find, however, that there are some qualities in which several species resemble each other; and therefore we refer them to a higher order called a *genus*, to which we give a name that is equally applicable to every species and every individual comprehended under it. Thus, men and horses and all living things on earth resemble each other in this respect, that they have *life*. We refer them therefore to the genus called *animal;* and this word belongs to every species of animals, and to each individual animal. The same classification is made both of artificial and abstract substances; of each of which there are genera, species, and individuals. Thus, in natural substances, animal, vegetable, and fossil, denote *genera;* man, horse, tree, metal, *species;* and Alexander, Bucephalus, oak, gold, *individuals*. In artificial substances, again, edifice is a *genus;* house, church, tower, are *species;* and the Vatican, St Paul's, and the Tower of London, are *individuals*. Lastly, in abstract substances, motion and virtue are *genera;* flight and temperance are *species;* the flight of Mahommed, and temperance in wine, are *individuals*. By arranging substances in this manner, and giving a name to each genus and species, the nouns necessary to any language are comparatively few and easily acquired; and when we meet with an object unknown to us, we have only to examine it with attention, and, comparing it with other objects, to refer it to the genus or species which it most nearly resembles. By this contrivance we supply the want of a proper name for the individual; and, as far as the resemblance is complete between it and the species to which it is referred, and of which we have given it the name, we may converse and reason about it without danger of error;

whereas had each individual in nature a distinct and proper name, words would be innumerable and incomprehensible; and to employ our labours in language would be as idle as that study of numberless written symbols which has been attributed to the Chinese.

Although nouns are thus adapted to express, not the individuals, but the genera or species into which substances are classed; yet, in speaking of these substances, whether natural, artificial, or abstract, all men must have occasion to mention sometimes one of a kind, and sometimes more than one. In every language, therefore, nouns must admit of some variation in their form, to denote *unity* and *plurality;* and this variation is called *number.* Thus in the English language, when we speak of a single place of habitation, we call it a house; but if of more, we call them houses. In the first of these cases the noun is said to be in the *singular*, in the last case it is in the *plural* number. Greek nouns have also a *dual* number to express two individuals, as have likewise some Hebrew nouns; but this variation is evidently not essential to language; and it is perhaps doubtful whether it ought to be considered as an elegance or as a deformity.

But although number be a natural accident of nouns, it can only be considered as essential to those which denote genera or species. Thus we may have occasion to speak of one animal or of many animals, of one man or of many men; and therefore the nouns *animal* and *man* must be capable of expressing *plurality* as well as *unity.* But this is not the case with respect to the proper names of individuals; for we can only say *Xenophon, Aristotle, Plato,* in the *singular*; as, were any one of these names to assume a plural form, it would cease to be the proper name of an individual, and become the common name of a species. Of this, indeed, we have some examples in every language. When a proper name is considered as a general appellative under which many others are arranged, it is then no longer the name of an individual, but of a species, and as such admits of a plural; as the *Cæsars*, the *Howards*, the *Pelhams*, the *Montagues;* but *Socrates* can never become plural, as long as we know of no more than one man of that name. The reason of all this will be obvious, if we consider that every genus may be found whole and entire in each of its species; for *man*, *horse*, and *dog*, are each of them an entire and complete animal; and every species may be found whole and entire in each of its individuals, Socrates, Plato, and Xenophon, being each of them completely and entirely *man.* Hence it is, that every genus, though *one*, is multiplied into *many;* and every species, though *one*, is also multiplied into *many*, by reference to those beings which are their subordinates; but as no individual has any such subordinates, it can never in strictness be considered as *many*; and so, as well in nature as in name, is truly an *individual* which cannot admit of number.

Nouns.

Besides number, another characteristic, visible in substances, is that of *sex.* Every substance is either male or female, or both male and female, or neither the one nor the other. So that with respect to sexes and their negation, all substances conceivable are comprehended under this fourfold consideration, which language would be very imperfect if it could not express. Now the existence of hermaphrodites being rare, if not doubtful, and language being framed to answer the ordinary occasions of life, no provision is made, in any of the tongues with which we are acquainted, for expressing, otherwise than by a name made on purpose, or by a periphrasis, duplicity of sex. With regard to this great natural characteristic, grammarians have made only a threefold distinction of nouns: those which denote *males* are said to be of the *masculine gender;* those which denote *females*, of the *feminine;* and those which denote substances that admit not of *sex*, are said to be *neuter*, or of *neither gender.* All animals have sex, and therefore the names of all animals should have gender. But the sex of all is not equally obvious, nor equally worthy of attention. In those species which are most common, or of which the male and female are, by their size, form, colour, or other outward circumstances, eminently distinguished, the male is sometimes called by one name, which is masculine, and the female by a different name, which is feminine. Thus in English we say, *husband, wife; king, queen; father, mother; son, daughter,* and so on. In others of similar distinction, the name of the male is applied to the female only by prefixing a syllable or by altering the termination; as *man, woman; lion, lioness; emperor, empress,* anciently *emperess; master, mistress,* anciently *masteress*; and so in other similar instances. When the sex of any animal is not obvious, or not material to be known, the same name, in some languages, is applied, without variation, to *all* the species, and that name is said to be of the *common gender.* Thus in Latin *bos albus* is a white ox, and *bos alba* a white cow. Diminutive insects, though they are doubtless male and female, seem to be considered in the English language as if they were really creeping things. No man, speaking of a worm, would say *he* creeps, but *it* creeps upon the ground. But although the origin of genders is thus clear and obvious, yet the English is the only language with which we are acquainted that deviates not, except in a very few instances, from the order of nature. Greek and Latin, and many of the modern tongues, have nouns, some masculine, some feminine, which denote substances where sex never had existence. Nay, some languages are so particularly defective in this respect, as to class every object, inanimate as well as animate, under either the masculine or the feminine gender, as they have no neuter gender for those which are of neither sex. This is the case with the Hebrew, French, Italian, and Spanish. But the English, strictly following the order of nature, puts every noun which denotes a male animal, and no other, in the masculine gender; every name of a female animal, in the feminine; and every animal whose sex is not obvious, or known, as well as every inanimate object whatsoever, in the neuter gender. And this gives our language an advantage above most others in the poetical and rhetorical style; for when nouns naturally neuter are converted into masculine and feminine, the personification is more distinctly and more forcibly marked. Some very learned and ingenious men have endeavoured, by what they call a more subtile kind of reasoning, to discern even in things without a sex a distant analogy to that *natural distinction,* and to account for the names of inanimate substances being, in Greek and Latin, masculine and feminine. But such speculations are wholly fanciful, and the principles upon which they proceed are overturned by an appeal to facts. Many of the substances that, in one language, have masculine names, have in others names that are feminine; which could not be the case were this matter regulated by reason or nature. Indeed, for this, as well as many other anomalies in language, no other reason can be assigned than that custom,

> Quem penes arbitrium est, et jus, et norma, loquendi.

It has been already observed that most nouns are the names, not of individuals, but of whole classes of objects termed genera and species.[1] In classing a number of individuals under one species, we contemplate only those qualities which appear to be important, and in which the several individuals are found to agree, abstracting the mind from the consideration of all those which appear to be less essential, and which in one individual may be such as have nothing exactly similar in any other individual upon earth. Thus, in classing the individuals which are comprehended under the species denominated horse, we pay no regard to their colour or their size; because experience teaches us that no particular colour or size is essential to that individual living creature, and that there are not perhaps upon earth two horses whose colour and size are exactly alike. But the qualities which in this process we take into view, are the general shape, the symmetry, and proportion of the parts; and in short, every thing which appears evidently essential to the life of the individual and the propagation of the race. All these qualities are strikingly similar in all the individuals which we call *horses*, and as strikingly dissimilar from the corresponding qualities of every other individual animal. The colour of a horse is often the same with that of an ox; but the shape of the one animal, the symmetry and proportion of his parts, are totally different from those of the other; nor could any man be led to class the two individuals under the same species. It is by a similar process that we ascend from one species to another, and through all the species to the highest genus. In each species or genus in the ascending series fewer particular qualities are attended to than were considered as essential to the genus or species immediately below it; and our conceptions become more and more general as the particular qualities which are the objects of them become fewer in number. The use of a general term, therefore, can recal to the mind only the common qualities of the class, the genus, or species, which it represents. But we have frequent occasion to speak of individual objects. In doing this, we annex to the general term certain words significant of particular qualities, which discriminate the object of which we speak from every other individual of the class to which it belongs, and of which the general term is the common name. For instance, in advertising a *thief*, we are obliged to mention his height, complexion, gait, and whatever may serve to distinguish him from all other men.

---

[1] It is almost unnecessary to observe, that the words *genus* and *species*, and the phrases *higher genus* and *lower species*, are taken in the logical sense; and not as the words *genus, species, order, class,* are often employed by naturalists.

The process of the mind in rendering its conceptions particular, is indeed exactly the reverse of that by which it generalizes them. For, as in the process of generalization, it abstracts from the ideas of any number of species certain qualities in which they differ from each other, and of the remaining qualities in which they agree constitutes the first genus in the ascending series; so, when it wishes to make its conceptions more particular, it annexes to the idea of any genus those qualities or circumstances which were before abstracted from it; and the genus, with this annexation, constitutes the first species in the descending series. In like manner, when it wishes to descend from any species to an individual, it has only to annex to the idea of the species those particular qualities which discriminate the individual intended from the other individuals of the same kind.

This particularizing operation of the mind points out the manner of applying the general terms of language for the purpose of expressing particular ideas. For, as the mind, to limit a general idea, connects that idea with the idea of some particular circumstance, so language, as we have already observed, in order to limit a general term, connects that term with the word denoting the particular circumstance. Thus, in order to particularize the idea of horse, the mind connects that general idea with the circumstance, suppose, of whiteness; and in order to particularize the word horse, language connects that word with the term white; and so in other instances. Annexation, therefore, or the connecting of general words or terms in language, fits it for expressing particular conceptions; and this must hold good alike in all languages. But the methods of denoting this annexation are various in various tongues. In English and most modern languages we commonly use for this purpose little words, which we have chosen to style *particles*; and in the Greek and Latin languages, the *cases of nouns* answer the same end.

Cases, therefore, though they are accidents of nouns not absolutely necessary, have been often considered as such; and they are certainly worthy of our examination, since there is perhaps no language in which some cases are not to be found, as indeed without them or their various powers no language could readily answer the purposes for which it was formed.

All the oblique cases of nouns, if we except the vocative, are merely marks of annexation; but as the connections or relations subsisting among objects are very various, some cases denote one kind of relation, and some another. We shall endeavour to investigate the connection which each case denotes, beginning with the *genitive*.

This is the most general of all the cases, and gives notice that *some* connection indeed subsists between two objects, but does not point out the particular kind of connection. That we must infer, not from our nature or termination of the genitive itself, but from our previous knowledge of the objects connected. That the genitive denotes merely relation in general, might be proved by adducing innumerable examples, in which the relations expressed by this case are different; but we shall content ourselves with one observation, from which the truth of our opinion will appear beyond dispute. If an expression be used in which are connected by the genitive case, two words significant of objects between which a twofold relation may subsist, it will be found impossible, from the expression, to determine which of these two relations is the true one, which must be gathered wholly from the context. Thus, for example, from the phrase *injuria regis*, no man can know whether the injury mentioned be an injury *suffered* or an injury *inflicted* by the king; but if the genitive case notified any particular relation, no such ambiguity could exist. This case therefore gives notice, that two objects are somehow connected,[1] but it marks not the particular sort of connection. Hence it may be translated by our particle *of*, which will be seen afterwards to be of a signification equally general.

The dative and accusative cases appear to have nearly the same meaning; each of them denoting apposition, or the junction of one object with another. Thus, when any one says, *Comparo Virgilium Homero*, Homer and Virgil are conceived to be placed beside one another, in order to their being compared; and this sort of connection is denoted by the dative case. In like manner, when it is said *latus humeros*, breadth is conceived as joined to or connected in apposition with shoulders; and the expression may be translated " broad *at* the shoulders."

This apposition of two objects may happen either without previous motion, or in consequence of it. In the foregoing instances no motion is presupposed; but if one say, *Misit aliquos subsidio eorum*, the apposition is there in consequence of motion. In like manner, when it is said *Profectus est Romam*, his apposition with Rome is conceived as the effect of his motion thither. From this idea of the accusative, the reason is obvious why the object after the active verb is often put in that case; it is because the action is supposed to proceed *from* the agent *to* the patient. But the same thing happens with respect to the dative case, and for the same reason. Thus, *Antonius læsit Ciceronem*, and *Antonius nocuit Ciceroni*, are expressions of the same import; in each the action of hurting is conceived as proceeding *from* Antony *to* Cicero; and this is finely illustrated by the passive form of such expressions, where the procedure above mentioned is expressly marked by the preposition *ab*, as *Cicero nocetur, Cicero læditur* AB *Antonio*. It is therefore not true that the accusative is that case, at least the only case, which to an efficient nominative and a verb of action subjoins either the effect or the passive subject; nor is the dative the only case which is formed to express relations tending to itself. The only thing *essential* to these two cases is to denote the apposition or junction of one object with another; and this they do nearly, if not altogether, in the same manner, although from the custom of language they may not be indifferently subjoined to the same verb.

---

[1] The Greek grammarians seem to have been aware of the nature of this case when they called it πτωσις γενικη, or the general case; a name of which the Latin grammarians evidently mistook the meaning when they translated it *casus genitivus*, or the generative case, which is a name totally foreign to its nature.

The Greek language has no *ablative* case; but in the Latin, where it is used, it denotes concomitancy, or that one thing accompanies another. From this concomitancy we sometimes draw an inference, and sometimes not. For example, when it is said, *Templum clamore petebant*, clamour is represented as concomitant of their going to the temple; but here no inference is drawn. From the phrase *Palleo metu*, although nothing more is expressed than that paleness is a concomitant of the fear, yet we instantly infer that it is also the effect of the fear. In most instances where the ablative is used, an inference is drawn, of which the foundation is some natural connection observed to subsist between the objects thus connected in language. When this inference is not meant to be drawn, the *preposition* is commonly added; as, *interfectus est* CUM *gladio*, he was slain with a sword *about* him; *interfectus est gladio*, he was slain with a sword as the *instrument* of his death.

The remaining cases, which have not been noticed, are the nominative and the vocative. These are in most instances alike in termination, which makes it probable that they were originally one and the same case. The foundation of this conjecture will appear from considering the use to which each of these cases is applied. The nominative is employed to call up the idea of any object in the mind of the hearer. But when a man hears his own name mentioned, his attention is instantly roused, and he is naturally led to listen to what is to be said. Hence, when one man meant particularly to solicit the attention of another, he would naturally pronounce that other person's name; and thus the nominative case would pass into a vocative, of which the use is always to solicit attention.[1]

The Greek and Latin among the ancient, and the German among the modern languages, express different connections or relations of one thing with another by cases. In English this is done for the most part by prepositions; but the English being derived from the same origin as the German, that is, from the Teutonic, has at least one variation of the substantive to answer the same purpose. For instance, the relation of possession, or belonging, is often expressed by a different ending of the substantive, which may be well called a case. This case answers nearly to the genitive case in Latin; but as that is not a denomination significant of the nature of the case in any language, it may perhaps in English be more properly called the possessive case. Thus, *God's grace*, anciently *Godis grace*, is the grace belonging to or in the possession of God; and may be likewise expressed by means of the preposition, as, *the grace of God*.

Although the word *Godis* is as evidently an inflexion of the noun *God* as the word *Dei* is an inflexion of *Deus*, there are grammarians who have denied that in English there is any true inflexion of the original noun, and who have said that the noun with the addition of that syllable which we consider as the sign of a case, ceases to be a noun, and becomes a definitive; a word which with them is devoid of signification. Thus, in the expression *Alexander's house*, the word *Alexander's* stands not as a *noun*, but as an article or definitive, serving to ascertain or point out the individuality of the house. But this is a palpable mistake. The word *Alexander's* serves not to point out the individuality of the house, but to show to whom the house belongs; and is therefore beyond dispute not an article, but a noun in the possessive case. Again, when we say *St Peter's* at Rome and *St Paul's* at London, the words *St Peter's* and *St Paul's* are neither articles, nor, as has been absurdly imagined, the proper names of edifices, like the Rotunda or the Circus, but they are, in the possessive case, the names of the two apostles to whom the churches were dedicated, and to whom they are supposed to belong.

But that this, which we have called the possessive case, is really not so, must be evident, it is said, because there are certain circumstances in which it cannot be substituted for the noun with the preposition prefixed. Thus, though a man may say, I speak *of* Alexander, I write *of* Cæsar, I think *of* Pompey, he cannot say, I speak Alexander's, I write Cæsar's, or I think Pompey's. This is indeed true, but it is nothing to the purpose. For though I may say *Loquor* DE *Alexandro, Scribo* DE *Cæsare, Cogito* DE *Pompeio*, I cannot say, *Loquor Alexandri, Scribo Cæsaris*, or *Cogito Pompeii*; and therefore all that can be inferred from this argument is, that as the Latin genitive is not always of the same import with the preposition *de*, so the English possessive is not always of the same import with the preposition *of*. Upon the whole, then, we may conclude that English nouns admit of one inflexion; and that though cases are not so essential to nouns as gender and number, no language can be wholly without them or their various powers.

II. *Of Articles or Definitives.*

The intention of language is to communicate thought, or to express those ideas which are suggested to us by our senses external and internal. The ideas first suggested to us are those of pain and pleasure, and of the objects with which we are surrounded; and therefore the words first learned must be nouns, or the names of objects natural, artificial, and abstract. Every object about which the human mind can be conversant is strictly and properly speaking particular; for all things in nature differ from one another in numberless respects, which, not to mention the idea of separate existence, so circumstance and individualize them, that no one thing can be said to be another. Now the use of language being to express our ideas or conceptions of these objects, it might naturally be expected that every object should be distinguished by a proper name. This would indeed be agreeable to the truth of things, but we have already seen that it is altogether impracticable. Ob-

---

[1] The chief objection to this conjecture, that the nominative and vocative were originally the same case, is taken from the Latin tongue, in which the nouns of the second declension ending in *us* terminate their vocative in *e*. But this is easily accounted for. The *s* in such words was often dropped, as appears from the scanning of old Latin poetry; when this was done, the *u* being short, would naturally in pronunciation pass into *e*, a like short vowel; and thus, in the vocative case, *e* would in time be written instead of *u*.

Articles.

jects have therefore been classed into genera and species; and names given, not to each individual, but to each genus and species. By this contrivance of language, we are enabled to ascertain in some measure any individual that may occur, and of which we know not the proper name, only by referring it to the genus or species to which it belongs, and calling it by the general or specific name; but as there is frequent occasion to distinguish individuals of the same species from one another, it became necessary to fall upon some expedient to mark this distinction. In many languages general and specific terms are modified and restricted by three orders of words; the *article*, the *adjective*, and the *oblique cases of nouns*. The cases of nouns we have already considered; the adjective will employ our attention afterwards; at present our observations are confined to the *article*, a word so very necessary, that without it, or at least some equivalent invention, men could not employ nouns to any of the purposes of life, or indeed communicate their thoughts at all. As the business of articles is to enable us, upon occasion, to employ general terms to denote particular objects, they must be considered in combination with the general terms as merely substitutes for proper names. They have, however, been commonly called definitives; because they serve to define and ascertain any particular object so as to distinguish it from the other objects of the general class to which it belongs, and, of course, to denote its individuality. Of words framed for this purpose, whether they have by grammarians been termed articles or not, we know of no language that is wholly destitute. The nature of them may be explained as follows.

An object occurs with which, as an individual, we are totally unacquainted; it has a head and limbs, and appears to possess the powers of self-motion and sensation; we therefore refer it to its proper species, and call it a dog, a horse, a lion, or the like. If it belongs to none of the species with which we are acquainted, it cannot be called by any of their names; we then refer it to the genus, and call it an animal.

But this is not enough. The object at which we are looking, and which we want to distinguish, is not a species or a genus, but an individual. Of what kind? Known or unknown? Seen now for the first time, or seen before and now remembered? This is one of the instances in which we shall discover the use of the two articles A and THE; for, in the case supposed, the article A respects our primary perception, and denotes an individual as unknown; whereas THE respects our secondary perception, and denotes individuals as known. To explain this by an example: I see an object pass by which I never saw till now: What do I say? There goes *a* beggar with *a* long beard. The man departs and returns a week after: What do I then say? There goes *the* beggar with *the* long beard. Here the article only is changed; the rest remains unaltered. Yet mark the force of this apparently minute change. The individual once vague is now recognised as something known; and that merely by the efficacy of this latter article, which tacitly insinuates a kind of previous acquaintance, by referring a present perception to a like perception already past.

This is the explanation of the articles A and THE as given by the learned Mr Harris, and thus far what he says on the subject is certainly just; but it is not true that the article THE always insinuates a previous acquaintance, or refers a present perception to a like perception already past. I am in a room crowded with company, of which the greater part is to me totally unknown; I feel it difficult to breathe from the grossness of the enclosed atmosphere; and, looking towards the window, I see in it a person whom I never saw before. I instantly send my compliments to *the* gentleman in the window, and request that, if it be not inconvenient, he will have the goodness to let a little fresh air into the room. Of this gentleman I have no previous acquaintance; my present perception of him is my primary perception, and yet it would have been extremely improper to send my compliments to *a* gentleman in the window. Again, there would be no impropriety in saying, "*A* man whom I saw yesterday exhibiting a show to the rabble was this morning committed to jail charged with the crime of housebreaking." Notwithstanding the authority, therefore, of Mr Harris, and his master Apollonius, we may venture to affirm, that it is not essential to the article A to respect a primary perception, or to the article THE to indicate a pre-established acquaintance. Such may indeed be the manner in which these words are most frequently used; but we see that there are instances in which they may be used differently. What, then, it may be asked, is the import of each article, and in what respects do they differ?

We answer, that the articles A and THE are both of them definitives, as, by being prefixed to the names of genera and species, they so circumscribe the latitude of those names as to make them for the most part denote individuals. A noun or substantive, without any article to limit it, is taken in its widest sense. Thus the word man means all mankind;

> The proper study of mankind is man;

where *mankind* and *man* may change places without making any alteration in the sense. But let either of the articles of which we are treating be prefixed to the word *man*, and that word is immediately reduced from the name of a whole genus to denote only a single individual; and instead of the noble truth which this line asserts, the poet will be made to say, that the proper study of mankind is not the common nature which is diffused through the whole human race, but the manners and caprices of one individual. Thus far therefore the two articles agree; but they differ in this, that though they both limit the specific name to some individual, the article A leaves the individual itself unascertained; whereas the article THE ascertains the individual also, and can be prefixed to the specific name only when an individual is intended of which something may be predicated that distinguishes it from the other individuals of the species. Thus, if I say, *a* man is fit for treasons, my assertion may appear strange and vague; the sentence, however, is complete, and wants nothing to make it intelligible; but if I say, *the* man is fit for treasons, I speak nonsense; for as the article THE shows that I mean some particular man, it will be impossible to discover my meaning till I complete the sentence, and predicate something of the individual intended to distinguish him from other individuals.

> The man that hath not music in himself....
> Is fit for treasons.

A man, therefore, means some one or other of the human race indefinitely; *the* man means, definitely, that particular man who is spoken of. The former is called the indefinite, the latter the definite, article.

The two articles differ likewise in this respect, that as the article A serves only to separate one individual object from the general class to which it belongs, it cannot be applied to plurals. It has indeed the same signification nearly with the numerical word *one*; and in French and Italian the same word that denotes unity is also the article of which we now treat. But the essence of the article THE being to define objects, by pointing them out as those of which something is affirmed or denied which is not affirmed or denied of the other objects of the same class, it is equally applicable to both numbers; for things may be predicated of one set of men, as well as of a single man, which cannot be predicated of other men. The use and import of each article will appear from the following example: "*Man* was made for society, and ought to extend his good will to *all men;* but *a man* will naturally entertain a more particular regard for *the men* with whom he has the most frequent intercourse, and enter into a still closer union with *the man* whose temper and disposition suit best with his own."

We have said that the article A cannot be applied to plurals, because it denotes unity. But to this rule there is apparently a remarkable exception in the use of the adjectives *few* and *many* (the latter chiefly with the word *great* before it), which, though joined with plural substantives, yet admit of the singular article A: as, *a few men*, *a great many men.* The reason of this is manifest from the effect which the article has in these phrases. It means a small or a great number collectively taken, to which it gives the idea of a whole, that is, of unity. Thus likewise *a hundred, a thousand,* is one whole number, an aggregate of many collectively taken, and therefore still retains the article A, though joined as an adjective to a plural substantive; as, *a hundred years.* The exception therefore is only apparent; and we may affirm that the article A universally denotes unity.

The indefinite article is much less useful than the other; and therefore the Greek and Hebrew languages have it not, though they have both a definite article. In languages of which the nouns, adjectives, and verbs, have inflexion, no mistake can arise from the want of the indefinite article; because it can always be known by the terminations of the noun and the verb, and by the circumstances predicated of the noun, whether a whole species or one individual be intended. But this is not the case in English. In that language, the adjectives having no variation with respect to gender or number, and the tenses of the verbs being for the most part the same in both numbers, it might be often doubtful, had we not the indefinite article, whether the specific name was intended to express the whole species or only one individual. Thus, if we say in English, *man was born sent from God,* we must be understood to mean that the birth of *every* man is from God, because to the specific term the indefinite article is not prefixed. Yet the words, Εγενετο ἀνθρωπος ἀπεσταλμενος παρα Θεου, convey no such meaning to any person acquainted with the Greek language; as the word ἀνθρωπος, without any article, is restricted to an individual by its concord with the verb and the participle; and the sense of the passage is, A *man was born, or existed, sent from God.* But though the *Greeks* have no article corresponding to the article A, yet nothing can be more nearly related than their 'Ο to our THE; 'Ο *βασιλευς*, THE *king*, TO δωρον, THE *gift.* In one respect, indeed, the Greek and English articles differ. The former is varied according to the gender and number of the noun with which it is associated, being ὁ, *masculine*, ἡ, *feminine*, το, *neuter*, and οἱ, αἱ, τα, in the *plural number;* whereas the English article suffers no change, being invariably THE before nouns of every gender and in both numbers. There are, however, some modern languages which, in imitation of the Greek, admit of a variation of their article which relates to gender; but this cannot be considered as essential to this species of words, and it may be questioned whether it be an improvement to the language. In tongues of which the nouns have no inflexion, it can only serve to perplex and confuse, as it always presents a particular idea of sex where in many cases it is not necessary.

The articles already mentioned are allowed to be strictly and properly such by every grammarian; but there are some words, such as *this*, *that*, *any*, *some*, *all*, *other*, &c. which are generally said to be sometimes articles and sometimes pronouns, according to the different modes of using them. That words should change their nature in this manner, so as to belong sometimes to one part of speech and sometimes to another, must appear very extraordinary; and if it were a fact, language would be a thing so equivocal, that all inquiries into its nature, upon principles of science and reason, would be vain. But we cannot perceive any such fluctuation in any word whatever; though we know it to be a general charge brought against words of almost every denomination, of which we have already seen one instance in the possessive case of nouns, and shall now see another in those words which are commonly called pronominal articles.

If it be true, as we acknowledge it to be, that the genuine *pronoun* always stands by itself, assuming the power of a noun, and supplying its place, then is it certain that the words *this, that, any, some,* &c. can never be *pronouns.* We are indeed told, that when we say *this* is virtue, give me *that*, the words *this* and *that* are pronouns; but that when we say, *this habit* is virtue, *that man* defrauded me, then are they articles or definitives. This, however, is evidently a mistake occasioned by overlooking those abbreviations in construction which are frequent in every language, and which, on account of that very frequency, have perhaps escaped the attention of grammarians whose sagacity has been successfully employed on matters less obvious. When we say *this* is virtue, it is evident that we communicate no intelligence till we add a substantive to the word *this*, and declare what is virtue. The word *this* can therefore in no instance assume the power of a noun, since the noun to which it relates, though for the sake of dispatch it may be omitted in writing or conversation, must always be supplied by the mind of the reader or hearer, to make the sentence intelligible, or *this* itself of any importance. When we have viewed speech analysed, we may then consider it as compounded. And here, in the first place, we may contemplate that synthesis which by combining simple terms produces a truth; then by combining two truths produces a third; and thus others and others in continued demonstration, till we are led, as by a road, to the regions of science. Now *this* is that superior and most excellent synthesis which alone applies itself to our intellect or reason, and which to conduct according to rule constitutes the art of logic. After *this* we may turn to those inferior compositions which are productive of the pathetic, &c. Here, if any where, the word *this* may be thought to stand by itself, and to assume the power of a noun; but let any man complete the construction of each sentence, and he will perceive that *this* is no more than a definite article. Thus, we may contemplate that synthesis which by combining simple terms produces a truth; then by combining two truths produces a third truth; and thus other truths and other truths in continued demonstration, till we are led, as by a road, into the regions of science. Now *this* combination of truths is that superior and most excellent synthesis which alone applies itself to our intellect or reason, and which to conduct according to rule constitutes the art of logic. After we have contemplated *this* art, we may turn, &c.

The word *that* is generally considered as still more equivocal than *this;* for it is said to be sometimes an article, sometimes a pronoun, and sometimes a conjunction. In the following extract it appears in all these capacities; and yet, upon resolving the passage into parts, and completing the construction, it will be found to be invariably a definite article. "It is necessary to *that* perfection, of which our present state is capable, *that* the mind and body should both be kept in action; *that* neither the faculties of the one nor of the other be suffered to grow lax or torpid for want of use; but neither should health be purchased by voluntary submission to ignorance, nor should knowledge be cultivated at the expense of health;

for *that* must enable it either to give pleasure to its possessor, or assistance to others." If this long sentence be resolved into its constituent parts, and the words be supplied which complete the construction, we shall see the import of the word THAT to be precisely the same in each clause. " The mind and body should both be kept in action; *that* action is necessary to *that* perfection of which our present state is capable; neither the faculties of the one nor of the other should be suffered to grow lax or torpid for want of use; the degree of action proper to prevent *that* laxness is necessary; but neither should health be purchased by voluntary submission to ignorance, nor should knowledge be cultivated at the expense of health; for *that* health must enable it either to give pleasure to its possessor, or assistanee to others." Again:

> He that's unskilful will not toss a ball.

A man unskilful (he is *that*) will not toss a ball. Here the word *that*, though substituted for what is called the relative pronoun, still preserves unchanged its definitive import; and in every instance, except where it may be used very improperly, it will be found to be neither more nor less than a definitive article.

It appears, then, that if the essence of an article be to define and ascertain, the words *this* and *that*, as well as *any*, *some*, *all*, &c. which are commonly called pronominal articles, are much more properly articles than any thing else, and as such should be considered in universal grammar. Thus, when we say, *this* picture I approve, but *that* I dislike, what do we perform by the help of the words *this* and *that*, but bring down the common appellative to denote two individuals, the one as the more near, the other as the more distant? So when we say, SOME men are virtuous, but ALL men are mortal; what is the natural effect of this *all* and *some*, but to define that universality and that particularity which would remain indefinite were we to take them away? The same thing is evident in such sentences as, " SOME substances have sensation, OTHERS want it; choose ANY way of acting, and SOME men will find fault," &c. For here *some*, *other*, and *any* serve all of them to define different parts of a given whole; *some*, to denote any indeterminate part; *any*, to denote any indefinite mode of action, no matter what; and *other*, to denote the remaining part, when a part has been assumed already.

We have said that the article is a part of speech so very necessary, that without it, or some equivalent invention,[1] mankind could not communicate their thoughts; and that of words falling under this description we know of no language which is wholly destitute. We are aware that these positions may be controverted; and that the Latin may be instanced as a language which, without articles, is not only capable of communicating the ordinary thoughts of the speaker to the mind of the hearer, but which, in the hands of Cicero, Virgil, and Lucretius, was made to serve all the purposes of the most profound philosopher, the most impassioned orator, and the most sublime poet. That the Latin has been made to serve all these purposes cannot be denied, although Lucretius and Cicero both complain, that on the subject of philosophy, where the use of articles is most conspicuous, it is a deficient language. But should we grant what cannot be demanded, that these two great men were unacquainted with the powers of their native tongue, our positions would still remain unshaken; for we deny that the Latin is wholly without articles. It has indeed no word of precisely the same import with our *the* or the Greek ὁ; but the place of the indefinite article A might be always supplied, if necessary, with the numerical word *unus*. It may be so even in English; for we believe there is not a single instance where the words *one man*, *one horse*, *one virtue*, might not be substituted for the words *a man*, *a horse*, *a virtue*, without in the slightest degree altering the sense of the passage where such words occur. This substitution, however, can be but seldom or never necessary in the Latin tongue, of which the precision is much greater than that of the English would be without articles, because the oblique cases of the Latin nouns, and the inflexion of its verbs, will almost always enable the reader to determine whether an appellative represents a whole species or a single individual. The want of the definite article *the* seems to be a greater defect; yet there are few instances in which its place might not be supplied by *this* or by *that* without obscuring the sense; and the Latin tongue is by no means deficient of articles corresponding to these two. Let us substitute the words *one* and *that* for *a* and *the* in some of the foregoing examples, and we shall find, though the sound may be uncouth, the sense will remain. Thus,

> THAT man who hath not music in himself....
> Is fit for treasons,

conveys to the mind of the reader the very same sentiment which the poet expresses by the words *the* man that hath not music, &c. Again, *Man* was made for society, and ought to extend his good will to *all men*; but *one* man will naturally entertain a more particular regard for *those men* with whom he has the most frequent intercourse, and enter into a closer union with *that man* whose temper and disposition suit best with his own. Now the words *hic* and *ille* being exactly of the same import with the words *this* and *that*, it follows, that wherever the place of the article *the* may in English be supplied by *this* or by *that*, it may in Latin be supplied by *hic* or by *ille*. This is the case with respect to Nathan's reproof of David, where the definite article is indeed most emphatical. The original words might have been translated into English, " thou art *that* man," as well as " thou art *the* man;" and in Latin they may with the utmost propriety be rendered, " Tu es ille homo." Indeed the words *hic* and *ille*, and we might instance many more, though they are commonly called pronouns, are in truth nothing but definite articles. *Hic* is evidently ὁκε; and *ille* is most probably derived from the Hebrew word *al*, in the plural *ale*, which may be translated indifferently, either *the* or *that*. But, what proves beyond dispute that these words are not pronouns, but articles, is, that in no single instance will they be found to stand by themselves and assume the power of nouns. For the sake of dispatch, or to avoid disagreeable repetitions, the noun may indeed be often omitted; but it is always supplied by the reader or hearer, when *hic* and *ille* appear in their proper place, and are seen to be invariably definitive articles. We shall give an example of the use of each word, and dismiss the subject.

In the first oration against Catiline, Cicero begins with addressing himself in a very impassioned style to the traitor, who was present in the senate-house. He then exclaims pathetically against the manners of the age, and proceeds in these words: *Senatus hæc intelligit, consul videt,* HIC *tamen vivit. Vivit? immo vero etiam in senatum venit; fit publici consilii particeps.* In this passage *hic* cannot be a pronoun; for from the beginning of the oration there occurs not a single noun of which it can possibly supply the place. When the orator uttered it, he was probably pointing with his finger at Catiline, and every one of his audience would supply the noun in his own mind, as we do when we translate it, "*yet* this traitor lies." When Virgil says,

---

[1] As in the Persian and other eastern languages, in which the place of our indefinite article is supplied by a termination to those nouns which are meant to be particularized.

> *Ille* ego, qui quondam gracili modulatus avena
> Carmen,

it is obvious that he means, I am *that man*, or *that poet*, who sung, &c.; and though we may translate the words "I am *he* who tuned his song," yet when we construe the passage we are under the necessity of supplying either *vates* or *vir*, which shows that *ille* is nothing more than a definite article signifying *that* or *the.* It appears, then, that the Latin tongue is not wholly destitute of articles, as few cases can occur where the Greek ὁ and our *the* may not be supplied by the words *hic* and *ille*, which have in our opinion been very improperly termed pronouns. If there be any such cases, we can only confess that the Latin language is defective; whereas, had it no articles, it is not easy to conceive how it could answer, to a cultivated people, the ordinary purposes of speech.

The articles *this* and *that*, unlike *a* and *the*, are varied according as the noun, with which they are associated, is in the singular or in the plural number. Thus we say, *this* and *that man* in the singular, and *these* and *those men* in the plural. The Latin articles *hic* and *ille*, for such we will call them, are varied, like the Greek ὁ, not only with the number, but also with the gender of their nouns. In languages where the structure of a sentence may be so changed from the order of nature, as it commonly is in Greek and Latin, and where the reader is guided, not by the position, but by the terminations of the words, to those which are in concord and those which are not, these variations of the articles have their use; but in English they are of no importance. Were it not that the custom of the language, the *forma loquendi* as Horace calls it, has determined otherwise, there would be no more impropriety in saying *this* or *that men*, than in saying *some men* or *the men.*

As articles are by their nature definitives, it follows of course that they cannot be united with such words as are in their own nature as definite as they may be, nor with such words as, being undefinable, cannot properly be made otherwise; but only with those words which, though indefinite, are yet capable through the article of becoming definite. Hence the reason why it is absurd to say, *the I* or *the thou*, because nothing, as will be seen afterwards, can make these pronouns more definite than they are of themselves; and the same may be said of proper names. Neither can we say, *the both*, because the word *both* is in its own nature perfectly defined. Thus if it be said, "I have read both poets," this plainly indicates a definite pair, of whom some mention has been made already. On the contrary, if it be said, "I have read two poets," this may mean any pair out of all that ever existed. And hence the numeral being in this sense indefinite, as indeed are all others as well as itself, is forced to assume the article whenever it would become definite. Hence also it is that as *two*, when taken alone, has reference to some primary and indefinite perception, whilst the article *the* has reference to some perception secondary and definite, it is bad language to say *two the men*, as this would be blending of incompatibles, that is, it would be representing two men as defined and undefined at the same time. On the contrary, to say, *both the men*, is good language; because the substantive cannot possibly be less apt, by being defined, to coalesce with a numeral adjective which is defined as well as itself. So likewise it is correct to say, *the two men*, *these two men*, or *those two men*; because here the article, being placed at the beginning, extends its power as well through the numeral adjective as the substantive, and tends equally to define them both.

As some of the above words admit of no article because they are by nature as definite as may be, so there are others which admit it not because they are not to be defined at all. Of this sort are all *interrogatives.* If we question about substances, we cannot say, *the who is this*, but *who is this?* And the same both as to qualities and quantities; for we say, without an article, *what sort of, how many, how great?* The reason is, the article *the* respects beings of which we can predicate something; but interrogatives respect beings about which we are ignorant, and of which we can therefore predicate nothing; for as to what we know, interrogation is superfluous. In a word, the natural associates of articles are *all those common appellatives which denote the several genera and species of beings:* and it may be questioned whether in strictness of speech they are ever associated with any other words.

We have said that proper names admit not of the article, being in their own nature definite. This is true, whilst each name is confined to one individual; but as different persons often go by the same name, it is necessary to distinguish these from one another, to prevent the ambiguity which this identity of name would otherwise occasion. For this purpose we are obliged to have recourse to adjectives or epithets. For example, there were two Grecian chiefs who bore the name of Ajax; and it was not without reason that Mnestheus used epithets when his intention was to distinguish the one from the other. "If both *Ajaxes* cannot be spared," said he, "at least let mighty Telamonian Ajax come." But as epithets are diffused through various subjects, in as much as the same adjective may be referred to many substantives, it has been said to be necessary, in order to render both parts of speech equally definite, that the adjective itself assume an article before it, which may indicate a reference to some single person only. It is thus we say, Trypho *the* Grammarian, Apollodorus *the* Cyrenian, &c. This is the doctrine of Mr Harris, from which, with the highest respect for the learning of the author, we feel ourselves obliged to dissent. In the examples given, the article THE is certainly not associated with the words Grammarian and Cyrenian, in the same manner in which it is associated with the word *man* in the sentence, "The man that hath not music in himself." When we say Apollodorus THE Cyrenian, we may, without folly or impertinence, be asked, the Cyrenian *what?* And the moment this question is answered, it will be seen that the article defines, not an adjective, but a substantive. If the answer be, the Cyrenian philosopher, the article *the* is associated with the word philosopher, and the phrase Apollodorus THE Cyrenian is an abbreviation of Apollodorus THE philosopher of Cyrene. In like manner, Trypho THE grammarian, is Trypho THE grammarian writer, or Trypho THE writer of grammar. Such abbreviations are very common. We say familiarly *the Speaker*, and are understood to mean a high officer in the British parliament; yet as speaker is a name common to many men, we may without impropriety be asked, *what* speaker we mean; and if so, we must reply, *the Speaker of the House of Commons.* But that which is eminent is supposed to be generally known; and therefore, in common language, *the speaker* is deemed a sufficient designation of him who presides over the lower house of parliament. Hence, by an easy transition, the definite article, from denoting reference, comes to denote eminence also; that is to say, from implying an ordinary preacquaintance, to presume a kind of general and universal notoriety. Thus *a king* is any king, but *the king* is that person whom we acknowledge as our sovereign, the king of Great Britain. In Greek, too, as in English, the article is often a mark of eminence; for *the Poet* meant Homer, and *the Stagyrite* meant Aristotle; not but that there were many poets besides Homer, and many stagyrites besides Aristotle, but none equally illustrious.

Before we dismiss the *Article*, we shall produce one example to show the utility of this species of words; which, although they may seem to be of small importance, yet, when properly applied, serve to make a few general terms sufficient for expressing with accuracy all the various objects about which mankind can have occasion to converse. Let *man* be the general term, which I have occasion to employ for the purpose of denoting some particular. Let it be required to express this particular as unknown, I say *a* man; known, I say *the* man; definite, *a certain* man; indefinite, *any* man; present and near, *this* man; present and at some distance, *that* man; like to some other, *such* a man; different from some other, *another* man; an indefinite multitude, *many* men; a definite multitude, *a thousand* men; the ones of a multitude taken throughout, *every* man; the same ones taken with distinction, *each* man; taken in order, *first* man, *second* man, &c.; the whole multitude of particulars taken collectively, *all* men; the negation of that multitude, *no* man; a number of particulars present and near, *these* men; at some distance, or opposed to others, *those* men; a number of individuals separated from another number, *other* men; a small indefinite number, *few* men; a proportionally greater number, *more* men; a smaller number, *fewer* men. And so we might proceed on almost to infinitude. But not to dwell longer upon this subject, we shall only remark, that minute changes in principles lead to mighty changes in effects; so that principles are well entitled to regard, however trivial they may appear.

III.—*Of Pronouns, or Substantives of the second order.*

To men who are neither intoxicated with their own abilities, nor ambitious of the honour of building new systems, little pleasure can accrue from differing upon points of science from writers of great and deserved reputation. In such circumstances a man of modesty, although he will not upon the authority of a celebrated name adopt an opinion of which he perceives not the truth, must always advance his own notions with some degree of diffidence, as being conscious that the truth which he cannot perceive, may be visible to a keener and more perspicacious eye. In these circumstances we feel ourselves with regard to some of the most celebrated writers on grammar, from whom, concerning one or two points, comparatively indeed of but little importance, we have already been compelled reluctantly to differ. In treating of pronouns we are likely to deviate still farther from the beaten track; but that we may not be accused of acting the part of dogmatists in literature, and of claiming from others that implicit confidence which we refuse to give, we shall state with fairness the commonly received opinions, point out in what respects we think them erroneous, assign our reasons for calling them in question, and leave our readers to judge for themselves. The most celebrated writer in English who has treated of pronouns, and whom, since the publication of his *Hermes*, most other writers have implicitly followed, is Mr Harris, who, after a short introduction, proceeds thus:—

" All conversation passes between individuals, who will often happen to be till that instant unacquainted with each other. What, then, is to be done? How shall the speaker address the other, when he knows not his name? or how explain himself by his own name, of which the other is wholly ignorant? Nouns, as they have been described, cannot answer this purpose. The first expedient upon this occasion seems to have been pointing, or indicating by the finger or hand; some traces of which are still to be observed, as a part of that action which naturally attends our speaking. But the authors of language were not content with this. They invented a race of words to supply this pointing; which words, as they always stood for substantives or nouns, were characterized by the name of *pronouns*. These also they distinguished into three several sorts, calling them pronouns of the first, the second, and the third person, with a view to certain distinctions, which may be explained as follows:—

" Suppose the parties conversing to be wholly unacquainted, neither name nor countenance on either side known, and the subject of the conversation to be the speaker himself. Here, to supply the place of pointing by a word of equal power, the inventors of language furnished the speaker with the pronoun I; *I* write, *I* say, *I* desire, &c.; and as the speaker is always principal with respect to his own discourse, this they called, for that reason, the pronoun of the first person.

" Again, suppose the subject of the conversation to be the party addressed. Here, for similar reasons, they invented the pronoun *thou; thou* writest, *thou* walkest, &c. And as the party addressed is next in dignity to the speaker, or at least comes next with reference to the discourse, this pronoun they therefore called the pronoun of the second person.

" Lastly, suppose the subject of conversation neither the speaker nor the party addressed, but some third object different from both. Here they provided another pronoun, *he, she*, or *it*; which, in distinction to the two former, was called the pronoun of the third person. And thus it was that pronouns came to be distinguished by their respective *persons*."

The description of the different *persons* here given is taken, we are told, from Priscian, who took it from Apollonius. But whatever be the deference due to these ancient masters, their learned pupil, though guided by them, seems not to have hit upon the true and distinguishing characteristic of the personal pronouns. He supposes, that when the names of two persons conversing together are known to each other, they may, by the use of these names, express all that the personal pronouns express; but this is certainly not true. To us, at least, there appears to be a very material difference between saying " George did this," and " I did this;" nor do we think that the power of the pronoun would be completely supplied by the name, even with the additional aid of indication by the hand. So, when one man says to another with whom he is conversing, " James did so and so;" it is surely not equivalent to his saying " You did so and so." If such were the case, one might pertinently ask, when both persons are known to each other, Why do they use the personal pronouns? Mr Harris tells us, that " when the subject of conversation is the speaker himself, he uses I; and when it is the party addressed, he uses *thou*." But, in fact, the nature of the personal pronouns has no sort of connection with the subject of conversation, whether that conversation relate to the speaker, the party addressed, or a Greek book. In this sentence, " I say that the three angles of every triangle are equal to two right angles," the speaker is surely not the subject of the discourse; nor is the party addressed, but the truth of his assertion, the subject of discourse in the following sentence: " *You* say, that Horne Tooke's Diversions of Purley is the most masterly treatise on grammar, as far as it goes, that you have ever seen." Mr Harris uses the phrase " becoming the subject of conversation," in no other sense than that when the speaker has occasion to mention *himself*, he uses I; when the party addressed, *thou*; and when some other person or thing, *he, she*, or *it*. But we know that he may use other words by no means equivalent to the two first of these pronouns, which will sufficiently mark himself, and the party addressed; and that he may use indifferently, and without the smallest injury to the sense, either the third pronoun, or the word for

Pronouns.

which it is merely a substitute. A man who sustains various characters may design himself by any one of them. Thus Mr Pitt might have spoken of himself as the first lord of the treasury, chancellor of the exchequer, or member for the university of Cambridge; and in each case he would have been what Mr Harris calls the subject of conversation; yet every one feels that none of these designations would have been equivalent to I. What, then, is the force of the personal pronouns?

It appears to be simply this: The first denotes the speaker, *as characterised by the present act of speaking*, in contradistinction to every other character which he may bear. The second denotes the party addressed, *as characterised by the present circumstance of being addressed*, in contradistinction to every other character. And what is called the pronoun of the third person is merely a *negation of the other two*, as the neuter gender is a negation of the masculine and feminine. If this account of the personal pronouns be true, and we flatter ourselves that its truth will be obvious to every body, there is but one way of expressing by other words the force of the pronouns of the first and second person. Thus, "The person who now speaks to you did so and so," is equivalent to "*I* did so and so;" and "The person to whom I now address myself did so and so," is equivalent to "*You* did so and so." Hence we see why it is improper to say the *I* or the *thou*; for each of these pronouns has of itself the force of a noun with the definite article prefixed, and denotes a person of whom something is predicted, which distinguishes him from all other persons. *I* is the person who now speaks, *thou* is the person who is now addressed by the speaker. Hence too we see the reason why the pronoun *I* is said to be of the first, and the pronoun *thou* of the second person. These pronouns can have place only in conversation, or when a man, in the character of a public speaker, addresses himself to an audience; but it is obvious that there must be a speaker before there can be a hearer; and therefore, that the pronouns may follow the order of nature, *I*, which denotes the person of the speaker, must take place of *thou*, which denotes the person of the hearer. Now the speaker and the hearer being the only persons engaged in conversation or declamation, *I* is with great propriety called the pronoun of the first, and *thou* the pronoun of the second person. We have said, that with respect to pronouns, the third person, as it is called, is merely a negative of the other two. This is evident from the slightest attention to the import of those words which are called pronouns of the third person. *He*, *she*, or *it*, denotes not the person either of the speaker or of the hearer; and, as we have just observed, no other person can have a share in conversation or declamation. An absent person or an absent thing may be the subject of conversation, but cannot be the speaker or the person addressed. *He*, *she*, and *it*, however, as they stand by themselves, and assume the power of nouns, are very properly denominated pronouns; but they are not personal pronouns in any other sense than as the negation of sex is the neuter gender.

We have already seen that nouns admit of number; pronouns, which are their substitutes, likewise admit of number. There may be *many* speakers at once of the same sentiment, as well as one, who, including himself, speaks the sentiment of *many*; speech may likewise be addressed to *many* at a time, as well as to *one*; and the subject of the discourse may likewise be *many*. The pronoun, therefore, of every one of the persons must admit of number to express this singularity or plurality. Hence the pronoun of the first person *I*, has the plural *we*; that of the second person *thou*, has the plural *ye* or *you*; and that of the third person *he*, *she*, or *it*, has the plural *they*, which is equally applied to all the three genders.

The Greeks and Romans, when addressing one person, used the pronoun in the singular number *thou*; whereas in the polite, and even in the familiar style, we, and many other modern nations, use the plural *you*. Although in this case we apply *you* to a single person, yet the verb must agree with it in the plural number; it must necessarily be, *you have*, not *you hast*. *You was*, the second person plural of the pronoun placed in agreement with the first or third person singular of the verb, is an enormous, though common solecism, which ought to be carefully avoided. In very solemn style, as when we address the Supreme Being, we use *thou*, perhaps to indicate that he is God alone, and that there is none like unto him; and we sometimes use the same form of the pronoun in contemptuous or very familiar language, to intimate that the person to whom we speak is the meanest of human beings, or the dearest and most familiar of our friends. A king, exerting his authority on a solemn occasion, adopts the plural of the first person, "*we* strictly command and charge;" meaning, that he acts by the advice of counsellors, or rather as the representative of a whole people. But in all cases in which the use of the pronoun deviates from the nature of things, the verb in concord deviates with it; for, as will be seen afterwards, these two words universally agree in number and person.

But though all these pronouns have number, neither in Greek, Latin, or any modern language, do those of the first and second person carry the distinctions of sex. The reason is obvious,[1] namely, that sex, and all other properties and attributes whatever, except those mentioned above as descriptive of the nature of these pronouns, are foreign from the intention of the speaker, who, when he uses the pronoun *I*, means *the person who now speaks*, no matter whether man or woman; and when the pronoun *thou*, *the person*, no matter whether man or woman, *to whom he now addresses himself*, and nothing more. But the pronoun of the third person denoting neither the speaker nor the hearer, but the subject of the discourse, and being merely the substitute of a noun which may be either masculine, feminine, or neuter, must of necessity agree with the noun which it represents, and admit of a triple distinction significant of gender. In English, which allows its adjectives no genders, this pronoun is *he* in the masculine, *she* in the feminine, and *it* in the neuter; the utility of which distinction may be better found in supposing it away. Suppose, for example, that we should in history read these words, *He caused him to destroy him*, and were informed that the pronoun, which is here thrice repeated, stood each time for something different; that is to say, for a man, for a woman, and for a city, whose names were Alexander, Thais, and Persepolis. Taking the pronoun in this manner, divested of its gender, how would it appear which was destroyed, which the destroyer, and which the cause that moved to the destruction? But there is no ambiguity, when we hear the genders distinguished: when we are told with the proper distinctions, that *she* caused *him* to destroy *it*, we know with certainty that the prompter was the woman; that her instrument was the hero; and that the subject of their cruelty was the unfortunate city. From this example we would be surprised how the Italians, French, and Spaniards could express themselves with precision or elegance with no more than two variations of this pronoun.

---

[1] The reason assigned by Mr Harris and his followers is, that "the speaker and hearer being generally present to each other, it would have been superfluous to have marked a distinction by art, which from nature and even dress was commonly apparent on both sides." This is perhaps the best reason which their description of the personal pronouns admits, but it is not satisfactory; for the speaker and hearer may meet in the dark, when different dresses cannot be distinguished.

Although in every language with which we are acquainted, there is but one pronoun for each of the first and second persons; and although it is obvious, from the nature and import of those words, that no more can be necessary; yet the mere English reader may perhaps be puzzled with finding three distinct words applied to each; *I*, *mine*, and *me*, for the first person; *thou*, *thine*, and *thee*, for the second. The learned reader will see at once that the words *mine* and *me*, *thine* and *thee*, are equivalent to the genitive and accusative cases of the Latin pronouns of the first and second persons. That *mine* is a pronoun in the possessive case is obvious; for if I were asked "whose book is that before me?" I should reply, "It is *mine*,"[1] meaning that it belongs to me. That the word *me* is the same pronoun in the case which the Latin grammarians call the accusative, is evident from the import of that word in the sentence *he admires me*, where the admiration is supposed to proceed from the person spoken of to the person who speaks. It appears, therefore, that though English nouns have only two cases, the nominative and possessive, the pronouns of that language have three, as, *I*, *mine*, *me*; *thou*, *thine*, *thee*; *he*, *his*, *him*, &c.; and that these are cases, can be questioned by no man who admits that *mei*, *mihi*, *me*, are cases of the Latin pronoun *ego*. Both pronouns, the Latin and the English, are irregularly inflected; and perhaps those words which are called the oblique cases of each may have originally been derived from nominatives different from *ego* and *I*; but these nominatives are now lost, and *mei* and *mine* have, beyond all dispute, the effect of the genitives of the Latin and English pronouns of the first person. These variations, however, cannot be looked upon as an essential part of language, but only as a particular refinement, invented to prevent the disagreeable repetition of the pronoun, which must frequently have happened without such a contrivance. This seems to have been the only reason why pronouns have been endowed with a greater variety of cases than nouns. Nouns are in themselves greatly diversified. Every genus and every species of objects has a distinct name, and therefore the sameness of sound does not so often occur among them as it would among the pronouns, without cases, where the same *I*, *thou*, *he*, *she*, or *it*, answers for every object which occurs in nature; but by this diversity in the form of the words, the *cacophonia*, which would be otherwise disgusting, is in a great measure avoided. It is, probably, for the same reason that the plural of each of these pronouns is so very different from the singular. Thus from *I*, *mine*, *me*, in the singular, is formed, in the plural, *we*, *ours*, *us*; from *thou*, *thine*, and *thee*, *ye* or *you*, *yours*, *you*; and from *he*, *she*, *it*, *his*, *hers*, *its*, *him*, *her*, *it*, in the singular, *they*, *theirs*, *them*, in the plural. In all of which there is not the least resemblance between the singular and plural of any one word; and except in *he*, *his*, *him*; *it*, *its*; *they*, *theirs*, *them*; there is not any similarity between the different cases of the same word in the same number.

From the account here given of the personal pronouns, it appears that the first or second will, either of them, coalesce with the third, but not with each other. For example, it is good sense, as well as good grammar, to say in any language, *I am he*, *thou art he*, *we were they*, *you were they*; but we cannot say, *I am thou*, nor *thou art I*, nor *we are you*, &c. The reason is, there is no absurdity for the speaker to be also the subject of the discourse, as when it is said, I am he; or for the person addressed, as when we say, thou art he. But for the same person, in the same circumstances, to be at once the speaker and the party addressed, is impossible; for which reason the coalescence of the pronouns of the first and second persons is likewise impossible.

I, *thou*, *he*, *she*, and *it*, are all that are usually called personal pronouns. There is another class of words, which are called sometimes pronominal adjectives, sometimes adjective pronouns, sometimes possessive pronouns; and by one writer of grammar they have been most absurdly termed pronominal articles. It is not worth while to dispute about a name; but the words in question are *my*, *thy*, *her*, *our*, *your*, *their*. These words are evidently in the form of adjectives; for, like other English adjectives, they have no variation to indicate either gender, number, or case; and yet they are put in concord with nouns of every gender and both numbers, as, *my wife*, *my son*, *my book*; *her husband*, *her sons*, *her daughters*, &c. But though in the form of adjectives, they have the power of personal pronouns in the possessive case: *my book* is the book of *me*, or the book of *him who now speaks*; *our house* is the house of *us*, or the house occupied by the *persons who now speak*; *her husband*, is the husband of a woman who can be known only from something preceding in the discourse; and *their property* is the property of them, of any persons, whether men or women, or both, who have been previously mentioned. Words which have the form of adjectives, with the power of pronouns, may, without impropriety, be called pronominal adjectives; and such is the name by which we shall henceforth distinguish them. To these pronominal adjectives, as well as to the personal pronouns, are subjoined the words own and self, and in the plural selves; in which case they are emphatical, and imply a silent contrariety or opposition. Thus, *I live in my own house*; that is, not in a hired house. *This I did with my own hand*; that is, not by proxy. *This was done by myself*; that is, not by another. The word self subjoined to a personal pronoun forms also the reciprocal pronoun; as, *we hurt ourselves by vain rage; he blamed himself for his misfortune. Himself*, *itself*, *themselves*, are supposed by Wallis to be put, by corruption, for *his self*, *its self*, *their selves*; so that *self* is always a substantive or noun, and not a pronoun. This seems to be a just observation; for we say, *the man came himself*, *they went themselves*; where the words *himself* and *themselves* cannot be accusatives, but nominatives, and were anciently written *his self*, *their selves*.

There are other words which are usually ranked under the class of pronouns; as *who*, *which*, *what*. These, when employed in asking questions, are called interrogative pronouns; though a name more characteristic might surely be found for them. Their import, however, will be more easily ascertained after we have considered another species of pronouns, which have been denominated relatives, and with which they are intimately connected.

The pronouns already mentioned may be called preposive, as may indeed all substantives, because they are capable of introducing or leading a sentence: but there is another pronoun which has a character peculiar to itself, and which, as it is never employed but to connect sentences, and must therefore have always a reference to something preceding, is called the subjunctive or relative pronoun. This pronoun is in Greek, ὁς ἡ, ὁ; in Latin, *qui, quæ, quod*; and in English, *who, which, what.*

---

[1] If we mistake not, Dr Johnson has somewhere affected to ridicule Bishop Lowth for considering the word *mine* as the possessive case of the pronoun of the first person. According to the doctor, *mine* is the same word with the pronominal adjective *my*; and was anciently used before a vowel, as *my* was before a consonant. This is not said with the lexicographer's usual precision. That *mine* was anciently used before a vowel is certain; but it does not therefore follow that it is the same word with *my*. If it were, we might on every occasion substitute either of these for the other, without offending against grammar, however we might injure the sound; but we apprehend that this is not the case. "That book is *mine*," is good English; but "that book is *my*" would be a gross solecism. The reason is, that *mine* is a genuine pronoun, and stands by itself with the power of a noun; but *my*, being an adjective, cannot stand by itself.

In order to determine with precision the nature and import of the *relative pronoun*, it will be necessary to ascertain the powers which it contains, or the parts of speech into which it is capable of being resolved. Now, it is obvious that there is not a single noun, or prepositive pronoun, which the relative is not capable of representing; for we say, I WHO *saw him yesterday cannot be mistaken;* YOU WHO *did not see him may have been misinformed;* THEY WHO *neither saw nor heard can know nothing of the matter;* THE THINGS WHICH *he exhibited were wonderful.* From these examples, it is apparent, in the first place, that the relative contains in itself the force of any other pronoun; but it contains something more.

If from any sentence in which there is a relative, that relative be taken away, and the prepositive pronoun which it represents be substituted in its stead, the sentence will lose its bond of union, and stand quite loose and unconnected. Thus, if instead of saying *the man is wise* WHO *speaks little*, we should say *the man is wise* HE *speaks little*, the sentence would be resolved into two; and what is affirmed of the man's wisdom, would have no connection with the circumstance of his speaking little. Hence it is evident, in the second place, that the relative contains the force of a connective as well as of the prepositive pronoun. What kind of connection it denotes is next to be ascertained.

It may be laid down as a general principle, that, by means of a relative pronoun, a clause of a sentence, in which there is a verb, is converted into the nature of an adjective, and made to denote some attribute of a substance, or some property or circumstance belonging to the antecedent noun. Thus, when it is said, *homo qui prudentia præditus est*, the relative clause, *qui prudentia præditus est*, expresses nothing more than the quality of prudence in concrete with the subject *homo*, which might have been equally well expressed by the adjective *prudens*. In like manner, when we say, *vir sapit qui pauca loquitur*, the relative fact expresses the property of speaking little as belonging to the man, and as being that quality which constitutes, or from which we infer, his wisdom; but if there were such a word as *pauciloquens*, that quality might very properly be expressed by it, and the phrase *vir sapit pauciloquens* would express the same assertion with *vir sapit qui pauca loquitur.*

Now if a relative clause expresses that which might be expressed by an adjective, the presumption is, that it may be resolved into the same constituent parts. But every adjective contains the powers of an abstract substantive, together with an expression of connection; and may be resolved into the genitive case of that substantive, or into the nominative with the particle *of* prefixed, which, in English, corresponds to the termination of the genitive in the ancient languages. That the member of a sentence in which there is a relative, may, in every instance, be analysed in the same manner, will be apparent from the following examples. *Vir qui sapit, vir sapiens*, and *vir sapientiæ*, "a man who is wise, a wise man, and a man of wisdom," are certainly phrases of the same import. Again, *homo, cui ingratus est animus, malus fit amicus*, may be translated into Greek, ἀνθρωπος ἀχαριστιας κακος γινεται φιλος; and into English, "the man of ingratitude is a bad friend."

Thus then it appears, that the relative pronoun contains in itself the force of the prepositive pronoun, together with that connection implied in English by the preposition *of*, and in the ancient languages by the genitive case. When one says, *vir sapit qui pauca loquitur*, the relative clause *qui pauca loquitur* expresses that attribute of the man from which his wisdom is inferred. It is conceived by the mind, as stripped of its propositional form, and standing in the place of a substantive noun governed in the genitive case by *vir*. The whole sentence might be thus translated, "the man *of little speaking* is wise;" or, did the use of the English language admit of it, "the man *of he speaks little* is wise." In like manner, when it is said, "Man, who is born of woman, is of few days and full of trouble," the relative clause is equivalent to an abstract noun in the genitive case, and the whole might be expressed in the following manner: "Man *of he is born of woman* is of few days and full of trouble."

It is obvious that these expressions into which, in the instances adduced, the relative clauses have been resolved, will appear extremely uncouth and offensive; but it is not meant to recommend them as common modes of phraseology. Against their being employed as such, present use loudly remonstrates.[1] They are introduced only with a view to show the true import of the relative pronoun; and for that purpose they are well adapted. That pronoun seems to be of use only when there is a deficiency of adjectives or substantives to denote some complex attribute by which we want to limit a general term or expression. Where such adjectives or substantives exist in language, we may indeed use the relative or not at pleasure. Thus we may say, *homo qui grandia loquitur*, or *homo grandiloquus;* because the adjective and the relative clause are precisely of the same meaning. But if the Latins were called upon to translate ανθρωπος αυτοδιδακτος, we believe they must have made use of the relative pronoun, as we know not any corresponding adjective in their language.

---

[1] It is worthy of observation, however, that, repugnant as such expressions are to the present idiom of the English language, there is nothing in the nature of the thing that could render the use of them improper. All prepositions, as will be seen afterwards, are expressive of relations subsisting between those objects of which they connect the signs in discourse. Those objects may be denoted, either by single words, and then the preposition will govern a noun; or by assertions, and then it will govern a nominative and a verb. Thus, when it is said, "I came after his departure," the preposition *after* expresses the relation between two events, *my coming* and *his departure*, and governs a substantive noun; but if it is said, "I came after he departed," the preposition in this case (for, as shall be shown afterwards, it is absurd to call it in the one instance a preposition, and in the other a conjunction) expresses the same relation as before, but governs a nominative and a verb.

This last expression is exactly similar to those employed above. When one says, for example, "the man *of he speaks little* is wise," however uncouth the expression may appear from its not being supported by the authority of custom, the preposition *of* is used precisely in the same manner, and serves the very same purpose, as when it is said, "the man *of little speaking* is wise." In both cases it denotes the relation between the two objects, *man* and *little speaking;* only in the one it is prefixed to a noun, in the other to an assertive clause of a sentence, the import of which is to be taken as a noun. Custom has indeed determined that prepositions shall more frequently govern a noun than a nominative and a verb; but they are, in their own nature, equally well adapted to answer both purposes.

But as the pronoun of the third person is merely the substitute of some noun, an objector may ask, What noun is here represented by *he?* "The man *of he speaks little* is wise." Who is meant by the pronoun *he?* We answer, *the man* who is declared to be *wise*. The objection proceeds from inattention to the radical signification of the word *of*, which a late ingenious writer has shown to be the fragment of a Gothic or Anglo-Saxon word, signifying *consequence* or *offspring*. If this be admitted, and, after the proofs which he has given, we think it cannot be denied, the uncouth phrase, "The man *of he speaks little* is wise," may be thus resolved, "The man, *in consequence* (of his mind is) *he speaks little*, is wise;" or, in other words. "The man, *in consequence* of his speaking little, is wise." The same acute writer, Mr Horne Tooke, has shown that *of* and *for*, though of different radical meanings, may often be substituted the one for the other without injury to the sense. Let this substitution be made in the present instance, and the propriety of the phrase will be apparent: "The man is wise *for* he speaks little." It must be remembered, however, that such a substitution cannot be made in every instance, because *for* signifies *cause*, and *of* signifies *consequence*.

The learned and ingenious Mr Harris, in his Treatise on Universal Grammar, has given an analysis of the relative pronoun very different from that which has been given by us. The result of his inquiry is, that the relative is equivalent to another pronoun, together with an expression of connection of that kind which is denoted by the particle *and.* This analysis he exemplifies, and endeavours to confirm, by the sentence, "Light is a body which moves with great celerity." Now, says he, instead of *which* substitute the word *and it*, and in their united powers you see the force and character of the pronoun here treated. But let any one attentively consider these two expressions, "Light is a body *which* moves with great celerity," and "Light is a body *and it* moves with great celerity;" and he will find that they are not precisely equivalent. For, to speak in the language of logic, there is in the first but one proposition, of which the subject is light, and the predicate a complex term expressed by the words, *body which moves with great celerity.* In the second there are two propositions, or two predications, concerning light; first, that it is a body; and, secondly, that it moves with great celerity. The relative clause, in the first case, expresses a property of the antecedent body, which, with that property, is predicated of the subject light; in the second case, this property is removed from the predicate of which it was an essential part, and is improperly converted into a new predication of the subject. The sentence may be resolved upon our principles, and its precise import preserved; as "Light is a body *of it moves with great celerity;*" the clause "it moves with great celerity," is conceived by the mind as having the force of an abstract substantive, and is connected with the antecedent body by the preposition *of*, answering to the termination of the genitive case. This abstract substantive thus connected expresses a quality of the body light. But by this example Mr Harris's doctrine is not exhibited in all its absurdity; it may be proper to try it by another.

Let us suppose that the following assertion is true; "Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends." Here it is evident there is but one proposition, of which the predicate is expressed by the words, "only monarch who conquered kingdoms to bestow them on his friends;" so that the relative clause is a necessary part of the predicate, and has, like an abstract noun in the genitive case, the effect of modifying the general term monarch. Resolve this sentence on Mr Harris's principles, and you have two propositions of which the first is a notorious falsehood: "Charles XII. was the *only monarch, and he* conquered kingdoms to bestow them on his friends." But instead of *and* substitute *of*, thus, "Charles XII. was the only monarch *of he conquered kingdoms to bestow them on his friends,*" and you preserve the true import of the expression.[1]

Are there no cases, then, in which the relative may be resolved into the connective *and* with a prepositive pronoun? Undoubtedly there are, and we shall now endeavour to ascertain them.

Adjectives in language have two different effects upon the substantives to which they belong, according to the nature of the attribute which they express. If the attribute expressed by the adjective be competent to all the species of which the substantive is the specific name, it is plain that the adjective does not modify or limit the substantive, for this obvious reason, that nothing can modify which is not discriminative. Thus, when Horace says, *Prata canis albicant pruinis*, the adjective *canis* denotes a quality common to all hoarfrost; and therefore cannot modify the substantive, because it adds nothing to the conception of which that substantive is the name. But when the attribute expressed by the adjective is competent to some individuals only of the species of which the substantive is the name, the adjective has then the effect of modifying or limiting the substantive. Thus when one says *vir bonus*, he makes use of an adjective which modifies the substantive, *vir*, because it expresses a quality or attribute which does not belong to all men.

The clause of a sentence, in which there is a relative, as it is in every other respect, so is it in this, equivalent to an adjective; it either modifies, or does not modify, the antecedent, according as the attribute which it expresses is or is not characteristic of the *species* to which the antecedent belongs. Thus, when it is said, "Man, who is born of woman, is of few days and full of trouble," the relative clause "who is born of woman," expresses an attribute common to all men, and therefore cannot modify. In like manner, when we say, "SOCRATES, who taught moral philosophy, was virtuous," the clause, "who taught moral philosophy," does not modify. In both these instances the relative clause might be omitted; and it might be said with equal truth, "Man is of few days and full of trouble," and "SOCRATES was virtuous."

But if it be said, *vir sapit qui pauca loquitur*, the relative clause, *qui pauca loquitur*, modifies the antecedent *vir*; for it is not affirmed of every man that he is wise, but only of such men as speak little. So "Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends;" and, "the man that endureth to the end shall be saved;" with many more examples that will occur to every reader.

Now it will be found that it is only when the relative clause expresses such a property or circumstance of the antecedent as does not limit its signification, that the relative pronoun can be resolved into a prepositive pronoun with the conjunction *and*, and that in these cases the relative clause itself is of very little importance. Thus in the assertion, "Charles XII. was the only monarch who conquered kingdoms to bestow them on his friends," where the relative clause is restrictive, the *who* cannot be resolved into *and he* consistently with truth or common sense. But in the expression, "Man, who is born of woman, is of few days and full of trouble," the relative *who* may be so resolved, at least without violating truth, thus, "man is of few days and full of trouble, and he is born of a woman." The only difference between the sentence with the relative *who*, and the same sentence thus resolved, is, that, in the former case, it contains but one predication; in the latter two, and these but loosely connected.

Thus, then, it appears that the general analysis of the

---

[1] Mr Harris was probably led into his opinion, from considering the Latin *qui* or *quis* as compounded of *que* and *is* (See *Hermes*, p. 81, 82, third edit.). But the notion of *Perizonius* is perhaps better founded, who, in his notes to the *Minerva* of Sanctius, considers it as immediately taken from the Greek τις, which in the Doric is made κις, and in the Latin *quis*. For it seems highly probable, as some ingenious writers have endeavoured to show, that the Latin is a dialect of the Greek. Of this at least we may be certain, that many words in the former are immediately adopted from the latter.

Pronouns.

relative pronoun is into the particle *of*, and a prepositive pronoun; but that there are also occasions on which it may be resolved into a prepositive pronoun and the particle *and*, without materially altering the sense. Now, what is the reason of this distinction?

If the relative clause be equivalent to an adjective, or to an abstract substantive in the genitive case, it is easy to see that the relative itself may, in every instance, be resolved into another pronoun and the particle *of*; but it will not perhaps be quite so evident how it should in any instance be resolved by *and*. This last analysis has its foundation in the nature of the particles *of* and *and*; or, to speak more properly, in the nature of the attribute which the relative clause expresses. Both the particles *of* and *and* are used to link or join conceptions together; but with this difference, that *of* has the effect of making the conceptions it connects figure in the mind as one object; whereas the conceptions connected by *and* are still conceived separately as before. To explain ourselves by an example: suppose we take two words, *man* and *virtue*, which denote two distinct ideas or conceptions, and join them together by the particle *of*, saying *man of virtue*; the mind no longer views them separately as significant of two conceptions, but of one. Take the same words, and join them together by the particle *and*, saying *man and virtue*; the conceptions denoted by *man* and *virtue* are still viewed separately as *two*, and notice is only given that they are collaterally connected.

This being the case, it follows, that when the relative modifies the antecedent, or, in other words, when the relative clause and the antecedent denote but one conception, the relative must then be resolved by *of*, in order to preserve this unity of conception. But when the relative does not modify the antecedent; that is, when its clause does not express any necessary part of a complex conception, then the conceptions or ideas denoted by the relative clause and the antecedent may be viewed separately as two; and therefore the relative may be resolved into the corresponding prepositive pronoun and the particle *and*.

To state this reasoning in a light somewhat different. As every relative clause, which expresses an attribute that is not applicable to a whole genus or species, must necessarily modify some general term, that is, restrict its signification; and as that general term must belong either to the subject or to the predicate of a proposition; it is evident, that every such relative clause is a necessary part of that subject or predicate in which its antecedent stands. If therefore a relative clause, which modifies, be taken away either from the subject or the predicate of a proposition; or if that connection, in consequence of which it modifies, be dissolved, which is always done when the relative is resolved by *and*; then the proposition itself will not hold true. The reason is, that the subject or the predicate becomes then too general; for, in the one case, something is predicated of a whole genus or species, which can be predicated only of some individuals of that genus or species; and in the other, a general predication is made where only a particular one can be applied. Thus, if it be said, "all men who transgress the laws are deserving of punishment;" the subject of the proposition is expressed by the words, "all men who transgress the laws." Take away the clause of the relative "who transgress the laws," and say, "all men are deserving of punishment;" and you have a proposition which is not true, because that is affirmed of the whole species which can be affirmed only of some individuals. Retaining now the clause of the relative, but resolving it by *and*, you have the same proposition as before; and together with it, in this instance, another which is equally false, namely, "all men, *and they* transgress the laws, are deserving of punishment;" that is, "*all men* are deserving of punishment, and *all men* transgress the laws."

But when the attribute expressed by the clause of the relative is characteristic of the genus or species of the antecedent, and consequently applicable to every individual which that genus or species comprehends, the relative clause may be entirely omitted without affecting the truth of the proposition, which is already as general as it can be. As in this case the import of the relative clause is not restrictive of the signification of the antecedent, it is of little consequence whether the attribute be represented by the connective part of the relative, as *of* the antecedent, or be affirmed to belong to the antecedent in a separate assertion. Thus it matters not much, whether we say, "man, who is subject to death, ought not to be too much elated," that is, according to our analysis, "man *of he is subject to death*, ought not to be too much elated;" or whether, forming the relative clause into a separate assertion, and connecting the two by the particle *and*, we say "man, and he is subject to death, ought not to be too much elated." In the one sentence, indeed, the reason is implied why man should not be too much elated, his being subject to death; and in the other, no reason is assigned for this; we only affirm that man is subject to death, and likewise that he should not be too much elated; but as both affirmations are equally true and evident, it is of little consequence, in such a case as this, whether the reason upon which either is founded be implied or not.

From the whole of this investigation, the following conclusions may be deduced as sufficiently established: 1*st*, That the relative pronoun contains in itself the united powers of a connective and another pronoun. 2*dly*, That *of* is the connective of which, together with another pronoun, it contains the powers, as in every possible instance it may be resolved into these constituent parts, and the import of the sentence in which it has place remain unaltered. 3*dly*, That in the ancient languages the relative clause of a sentence has the import of an abstract substantive in the *genitive case*; in English, with the particle *of* prefixed. 4*thly*, That the relative pronoun is of necessary use only where there is a deficiency of adjectives or substantives to denote some complex attribute, by which we want to limit a general term or expression; but that where such adjectives or substantives exist in language, we may use the *relative* or not at pleasure. And, 5*thly*, That though, in cases where the relative clause does not limit a general term, the relative pronoun may, without violating truth, be analysed by *and*; yet such analysis is never proper, as it gives two predicates to the same subject, which, in the original proposition, had but one predicate.

If the clause of the relative be equivalent to an adjective, as in every instance it seems to be, it will naturally occur, that in the ancient languages, the relative should agree with its antecedent in gender, number, and case. They do agree for the most part in gender and number; in case they cannot often, because the very intention of introducing a relative into language is to represent the antecedent in a different case. Whenever we have occasion to use a substantive or noun in a clause of a sentence, and afterwards to express by another clause, in which there is a verb, an attribute of the object denoted by that substantive, we then employ the relative pronoun. Now it seldom happens that the two clauses admit of the same regimen; and hence the case of the relative is often necessarily different from that of the antecedent, as the case of each must be accommodated to the clause in which it is found. Thus we cannot say, "Deus *qui* colimus bonus est;" but, "Deus *quem* colimus bonus est;" because the regimen of the verb *colo* is always the accusative.

This shows the necessity of introducing a relative into those languages which give inflexions to their nouns. Were all the nouns of a language indeclinable, there would be little occasion for a relative; and accordingly in English it is often omitted. Examples are frequent in our best authors. Suffice it to quote the following.

> For I have *business would employ* an age.—*Rowe.*
> I had several *men died* in my ship of calentures.—*Swift.*
> They affect to guess at the *object they* cannot see.—*Bolingbroke.*

We are not ignorant that our most eminent grammarians consider such expressions as chargeable with impropriety; and we are far from recommending them in any dignified or solemn composition. But in the instances adduced there is not the smallest degree of obscurity; at least there is none occasioned by the omission of the relative. The reason seems to be, that the mind can easily, by an effort of its own, make the antecedent unite, first with the one clause, and then with the other. Thus, when it is said, "I have business would employ an age," the mind can, without any difficulty, as the word business has no inflexions, consider it first as the objective case after *have*, and then as the nominative to *would employ*; but this cannot be so easily done in the ancient languages, where the termination of the noun is changed by the variation of its cases.

Both in the learned and in the living languages the relative has different forms, corresponding to the different genders of nouns; and by these it gives notice whether it is applied to persons, or to things without life. Thus in the English language we say, The man or the woman *who* went to Rome; The tree *which* stands on yonder plain. It admits likewise, when applied to males or females, a variation of cases similar to that of the personal pronouns. Thus we say, The man *whose* book is now before me; The man or woman *whom* I saw yesterday; but the neuter admits of no such distinction,[1] as we say, The tree *which* I saw, as well as The tree *which* stands on yonder plain. In modern languages the relative admits not of any distinction to denote number; for we say, The *man* or the *men* who came yesterday; The *man* or the *men* of whom I speak.

In English, the word *that*, which by some has been called a demonstrative pronoun, by others a pronominal article, and by us a definite article, is often used instead of the relative, as in the following examples: "He is the same man *that* I saw yesterday; he was the ablest prince *that* ever filled a throne." With regard to the principle upon which this acceptation of the word *that* depends, we beg to offer the following conjecture.

In English, from the phlegmatic arrangement of the language, occasioned by the want of inflexions and conjugations, the place of every part of a sentence is almost uniformly determined, and very little variety is allowed in the collocation of the words. The adjective is almost always placed in apposition with its substantive, and the nominative with its verb. In consequence of this uniformity in the collocation of the words, the mind acquires a habit of connecting in idea any kind of word with the place in which it is used to stand; and is naturally led to consider every word which stands in such a place as belonging to such a class. Hence it is, we imagine, that the definitive *that* passes into the nature of the relative pronoun; as in those instances in which it occupies the place of the relative, it was natural to consider it as having the same import. Yet the word *that* has undoubtedly in itself no more the force of the relative pronoun than *the* or *this*, or any other definitive whatever. In such expressions as the foregoing, it is not improbable that originally the clause of the definitive *that*, which we now call the *relative* clause, was thrown in as a kind of modifying circumstance, thus, "The book (I read that) is elegant," where the speaker, finding the word book too general for his purpose, throws in a clause to qualify and restrict it, or to confine his affirmation to that particular book which he is then reading. We can easily suppose that through time the definitive *that* in such an expression might be transposed or removed from its own place to that of the relative; so that the expression would run thus, "The book *that* I read is elegant;" which would be considered as precisely equivalent to "The book *which* I read is elegant." This opinion is not a little confirmed by a similar use of the article in Greek, which, though undoubtedly a definitive like the English *the*, is often used instead of the relative pronoun. Numberless examples may be found in Homer and Herodotus, especially in the latter, who seldom uses what is properly called the relative. We shall produce one instance from each.

> *Εισεαι Ατρειδην Αγαμεμνονα,* ΤΟΝ *περι παντων*
> *Ζευς ενεηκε πόνοισι διαμπερὲς.*—*Homer.*
>
> *Ορκιοισι γαρ μεγαλοισι κατειχοντο* (*scil.* *Αθηναιοι*) *δεκα*
> *ετεα κρησεσθαι νομοισι* ΤΟΥΣ *αν σφισι Σολων θηται.*—*Herodot.*

We have said that the interrogative pronouns, as they are called, *who*, *which*, *what*, are intimately connected with relatives; we now affirm, that the two first of these words are nothing but relatives, and that the last contains in itself the united powers of a relative and a definitive. With respect to cases, number, and gender, the words *who* and *which*, when employed as interrogatives, differ not from the same words when employed as relatives; and we hold it as a maxim, without which science could not be applied to the subject of language, that the same word has always the same radical import, in whatever different situations it may be placed. To understand this, it is necessary to observe, that all men have a natural propensity to communicate their thoughts in the fewest words possible: hence it follows, that words are often omitted which are necessary to complete the construction of the sentence; and this nowhere happens more frequently than in the use of *who* and *which*. In sentences where these words are confessedly relatives, we often find them without an antecedent; as,

> *Who* steals my purse steals trash.—*Shakspeare.*
> Which *who* would learn, as soon may tell, &c.—*Dryden.*
> Qui *Bavium non odit, amet tua carmina, Mœvi.*—*Virg.*

That is, "*He* who steals my purse;" "Which *he* who would learn, as soon may tell;" and "Ille *qui Bavium non odit*," &c. Such abbreviations occasion no obscurity, because from previous circumstances the hearer knows the mind of the speaker and the persons to whom he refers. But it is not with respect to the relative and antecedent only that such abbreviations have place; in sentences of a different form, whole clauses are sometimes omitted, whilst the meaning of the speaker is made sufficiently plain. Thus, when King Richard III. having lost his horse in battle, exclaims,

> A horse! a horse! my kingdom for a horse!

there is no complete thought expressed; but the circumstances in which the king then was, enabled those about him to understand that he *wanted a horse*. Accordingly Catesby answers him,

> Withdraw, my lord; I'll help you to a horse.

In like manner, when a person asks a question, his expression is frequently incomplete; but the tone of his voice, or some other circumstance, enables us to ascertain his meaning, and to supply, if we please, the words that are omitted. Thus when it is said, *An fecisti?* nothing more is expressed than *If you did it*, the Latin *an* being nothing else but the Greek *αν*, *si*; but some circumstance enables the person who hears it to know that the meaning is, "Say if you did it." Let us apply these observations to the words *who* and *which*. If these words be relatives, and if our analysis of the relative be just, it is obvious, that no complete meaning can be contained in the clause, "Who is your principal friend?" for that clause contains nothing more than the circumstance of being your principal friend predicated of some unknown person; "of he is your principal friend." That this is indeed the case, every man may be convinced, by asking himself what he means by the interrogative *who* in such a sentence; for he will find it impossible to affix to it any meaning without supplying an antecedent clause, by which that which is called an interrogative will be immediately converted into the relative pronoun. The custom, however, of language, and the tone of voice with which the relative clause is uttered, intimates, without the help of the antecedent, the wish of the speaker to be informed by the person addressed of the name and designation of his principal friend; and we know that the sentence when completed is, "Tell me the name and designation of the person who is your principal friend." Again, when the prophet says, "Who is this that cometh from Edom, with dyed garments from Bozrah?" he utters but part of a sentence, which when completed will run thus: "*Describe the person* who cometh from Edom (this is that *person*), with dyed garments from Bozrah." He sees a person coming from Edom, of whose name and designation he is ignorant; he calls upon some one for information concerning these particulars; and that there may be no mistake, he describes the unknown person as having "dyed garments from Bozrah;" but lest even that description should not be sufficiently accurate, he throws in the definitive clause, "this is that person," pointing at him, we may suppose, with his finger. *Which*, used as an interrogative, indicates a wish of knowing a particular person or thing out of more than one mentioned; as, "Which of the two did it?" that is, "*Tell me the one* of the two which did it;" for, in old English, *which* as a relative is often used, where in modern English we should say *who*; and that mode of speech is still retained when the antecedent is omitted, and the relative clause employed to indicate such a wish as that before us. *What* includes in itself the signification of a definitive and a relative pronoun; as, "from what has gone before, *what* follows may easily be guessed;" where the word *what* is equivalent to *that which*. When therefore we say, "What rude fellow is that?" our meaning is, "*Describe* that *person* who is that rude fellow." Upon the whole, then, it is evident, that the words called interrogatives are merely relative pronouns; and that interrogative sentences are relative clauses uttered in such circumstances as to enable the hearer to supply the antecedents necessary to complete the meaning.

---

[1] "*Whose* is by some authors made the possessive case of *which*, and applied to things as well as persons; I think, improperly.—*Lowth.*

In fine, we have seen that substantives are either primary or secondary; or, in other words, nouns or pronouns. Nouns denote substances, and those either natural, artificial or abstract. They moreover denote things either general, or special, or particular; and a general or specific name is made to denote an individual by means of words called articles or definitives. Pronouns are the substitutes of nouns, and are either prepositive or subjunctive. The prepositive is distinguished into three orders, called the first, the second, and the third person. The subjunctive, otherwise called the relative, includes the powers of all those three, having superadded as of its own the peculiar force of a connective.

IV. *Of Verbs.*

The words which we have hitherto considered are commonly called substantives primary or secondary, and definitives; because nouns are significant of substances; pronouns are the substitutes of nouns; and the article serves to ascertain the extent of the noun, and to determine whether on any occasion it be significant of a whole class of substances, or only of one individual. But substances are of importance to mankind only on account of their various qualities or attributes; for their internal texture is a thing of which we are profoundly ignorant, and with which we have no manner of concern. Thus, experience teaches us that certain vegetables are pleasant to the taste, and wholesome food; whilst others are unpleasant and poisonous. The former kinds are valuable only for their qualities or attributes; and they are the qualities or attributes of the latter that make them worthless or hurtful. A horse is strong, and swift, and docile, and may be trained to carry a man on a journey, or to drag a plough. It is for his strength, swiftness, and docility, that he is the most valuable of all quadrupeds. One man is brave, another learned, and another eloquent; and by possessing these different qualities or attributes, each is fitted for a different station in society. It is plain, therefore, that in contemplating substances, our attention must be principally bestowed upon their qualities, and that the words which serve to denote these qualities must be an essential part of language. Such words are in general called attributives, and are of three sorts, verbs, participles, and adjectives.

Of all the constituent parts of speech, none has given the grammarians greater trouble than the verb. The vast variety of circumstances which it blends together in one word throws very considerable difficulties in the way of him who attempts to analyse it and ascertain its nature; at the same time that, by its eminent use in language, it is entitled to all the attention which can be bestowed upon it. To the discussion of the verb, Mr Harris, whose notions of this as of the other parts of speech have been generally adopted by the subsequent writers on grammar, has dedicated a large proportion of his book, in which he has thrown out many excellent observations, mixed, as it appears to us, with several errors. We have already observed, that no man is ignorant when he uses what is called a *verb* and when a *noun*. Every schoolboy knows that the words *is*, *loveth*, *walketh*, *standeth*, in English, and *est*, *amat*, *amatur*, *ambulat*, *stat*, in Latin, are verbs; he knows likewise that they are of different kinds, that some of them are said to be active, some passive, and some neuter. But it should seem that the first object of our investigation ought to be the characteristic of the verb, or that which all these words have in common, and which constitutes them *verbs*, distinguishing them from every other species of words. Now it is obvious to the slightest attention, that every verb, whether active, passive, or neuter, may be resolved into the substantive verb IS, and another *attributive*; for *loveth* is of the same import with IS *loving*; *walketh*, with IS *walking*; and *amat*, with *amans est*. But *loving*, *walking*, and *amans*, are not verbs; and hence it follows, that the characteristic of the verb, that which constitutes it what it is, and cannot be expressed by other words, must be that which is signified by the word IS; and to us that appears to be neither more nor less than assertion.

Assertion, therefore, or predication, is certainly the very essence of the verb, as being that part of its office, and that part only, which cannot be discharged by other kinds of words.[1] Every other circumstance which the verb includes, such as attribute, mode, time, it may be possible to express by adjectives, participles, and adverbs;

---

[1] Hence a common noun, or even a proper name, may be converted into a verb by being rendered assertive or predicative. Thus, in the indignant rebuke addressed by Rob Roy to Rashleigh Osbaldistone, "Don't Mr or *Campbell* me, sir; my foot is on my native heath, and my name is Macgregor;" the proper name "*Campbell*," being that which Rob usually assumed in his lowland and southern expeditions, is converted into a verb, and great force thereby given to the exclamation. (*Dr Hunter.*)

but without a verb it is impossible to predicate, to affirm or deny, any one thing of any other thing. The office of the verb, then, when stript of all accidental circumstances, seems to be merely this: "To join together the subject and predicate of a proposition." Its powers are analogous to those of the sign + in algebra, which does not affect the separate value of the quantities between which it is placed, but only indicates their union or coalescence. To explain by an example: When we say, *Cicero eloquens, Cicero wise:* these are imperfect sentences, though they denote a substance and an attribute. The reason is, that they want an assertion, to show that such an attribute appertains to such a substance. But when we insert the word *was,* we join the substance and attribute together; we give notice that the *wisdom* and *eloquence* are applied to *Cicero,* and we do nothing more; we neither increase the wisdom nor diminish it, we neither make it real nor imaginary; for it was supposed in all its extent when the words *Cicero* and *wise* stood independent of each other. We may indeed use the verb in a form which implies not an assertion only, but likewise an attribute; as when we say, *George writeth,* or *George walketh.* But as whiteness or any other particular colour is not of the essence of a horse, an animal which is found of all colours; so, in the phrases quoted, the attribute, though implied, is not of the essence of the verb; for it may be equally well expressed by other words, as *George* IS *writing,* and *George* IS *walking,* which are phrases of the very same import with *George writeth* and *George walketh.*

In resolving every verb, whether active, passive, or neuter, into the substantive verb IS and another attributive, we have the honour to agree with all the grammarians; but to the word IS itself the learned author of *Hermes* has given a meaning which, as a verb, it does not admit. He observes, that before any thing can be the subject of a proposition, it must exist; that all existence is either absolute or qualified, mutable or immutable; that the verb IS can by itself express absolute existence, but never the qualified, without subjoining the particular form; and that it signifies both mutable and immutable existence, having in these cases different meanings, although the sentences which he gives as examples are evidently constructed in the same manner, and consist of the same parts of speech. His examples are: Of absolute existence, B IS: of qualified, B IS *an animal*; of mutable, *This orange* IS *ripe*; of immutable, *The diagonal of the square* IS *incommensurable with its sides.* But if predication be the essence of verb, all this is nothing to the purpose, and part of it is not true. It is not true that the verb IS ever varies its signification; for it has as verb no connection with existence of any kind. All such circumstances are superadded to its verbal nature; or, to speak more accurately, we infer such circumstances from our previous knowledge of the objects concerning which the predication is made. When we say, "*This* orange IS ripe," we do indeed mean, as Mr Harris observes, that it *is* so now at this *present* in opposition to past and future time; but it is not the verb IS, but the definitive *this,* which fixes the time of maturity, as well as the place, of the orange. If we had said, Oranges ARE ripe, we might have been properly asked, When and where are they ripe? although the same verb is used in both sentences. Even in the sentence B IS, absolute existence, the most simple of all, is inferred, and not expressed, by the verb; and the inference is made from this obvious principle, that when one utters a mark of predication, we naturally conclude that he means to predicate something of the subject. If he adds no specific predication, as B IS ROUND, we apply to B the most general that we can; and what other species is so general as existence?

That the idea of existence, considered as mutable or immutable, is not contained in the verb IS itself, but is derived from our knowledge of the objects concerning which the predication is made, appears manifestly from this, that if a person be supposed ignorant of the meaning of the words GOD and MAN, whilst he knows that of IS, the uttering of the two propositions, *God is happy,* and *This man is happy,* will give him no notice of existence considered as mutable or immutable, temporary or eternal.[1] His conclusion with respect to these modes of existence, if any such conclusion be drawn at all, must be derived entirely from his previous knowledge of the nature of God and the nature of man.

Some of our readers may possibly think this notion of verb too abstract and metaphysical; yet what other circumstance than mere predication is essential to that species of words? We say *essential*; for we are inquiring, not what is expressed by each individual verb, but what it is which is equally expressed by all verbs, and which distinguishes them from the other parts of speech. And if it be true, that every thing which the verb implies, predication alone excepted, may be expressed by other parts of speech, and that no other parts of speech can predicate, then we think ourselves warranted to affirm, that simple predication is the essential characteristic of *verb*; that every word which predicates is a VERB; and that nothing is so which does not predicate.

It must not, however, be concealed, that a doctrine very different from this has been maintained by a writer of distinguished abilities. "We have *energy* expressed," says Dr Gregory,[2] "and of course a verb constituted without affirmation, when we wish or command; without command, when we affirm or wish; without wish, when we command or affirm; yet in all these cases we have equally and indisputably a verb."

That in all these cases we have a verb, is indeed indisputable; but we hold it to be equally indisputable, that in all these cases we have affirmation. The ingenious author has given no direct example of a wish or command uttered without affirmation; and a feeling or sentiment which is not uttered has nothing to do with language; but he has given a sentence in which there are three verbs, that in his opinion denote no affirmation, but a very plain supposition. If a supposition can be expressed without affirmation, we shall very readily allow that a wish or command may be so expressed likewise. The doctor's supposition is thus expressed: "*Had* any punishment ever overtaken you for your broken vows; *were* but one of your teeth growing black, or even *were* but one of your nails growing less beautiful, I should believe you." It is almost superfluous to observe, that to every verb not in the infinitive mode there must be a nominative, and to every active verb an object, whatever be the arrangement of the sentence in which such verbs are found. These are truths known to every schoolboy; the reasons of them shall be afterwards given. It is likewise undeniable, that in the sentence before us the nominative to "had" is "any punishment;" to the first, "were one of your teeth;" and to the second, "one of your nails." But the sentence arranged in grammatical order, with the several nominatives before their respective verbs, is evidently elliptical; and the conjunction *if* must be supplied as well to complete the construction as to make sense of the passage. "*If* any punishment had ever overtaken you; *if* but one of your teeth were growing black, or even *if* but one of your nails were growing less beautiful, I should believe you." Now it has been proved, by such evidence as leaves no room for doubt, that *if*, though called a conjunction, is in fact a verb in the imperative mode, of the same import with *give*; so that we may substitute the one for the other without in the smallest degree altering the sense. The sentence will then run thus: "*Give* any punishment had ever overtaken you; *give* but one of your teeth were growing black, &c. I should believe you." It is therefore so far from being true, that *had* and *were*, when the sentence is completed, express no affirmation; that it is only upon granting the truth of the affirmation which they denote that the speaker says, "I should believe you." "Any punishment had ever overtaken you," is plainly an affirmation; *if give* that affirmation, *admit its truth*, "I should believe you." But it cannot be supposed that *had* and *were* change their significations by a mere change of place, or that by being removed from the middle to the beginning of a clause they lose their original import, and come to denote something entirely different. Were this the case, every attempt to ascertain and fix the general principles of grammar would be as ridiculous as an attempt to arrest the course of time. For what purpose, then, it may be asked, if the verb always denotes affirmation, is it removed from the middle to the beginning of the clause, when supposition is implied, as in the present instance? We answer, that supposition is neither more nor less than conditional affirmation; that when such affirmation is completely expressed, the verb is not removed to the beginning of the clause; and that such removal takes place only when the clause is elliptical, being merely an artificial contrivance in language, to show the reader or hearer that some such word as *if*, demanding the truth of the affirmation, is omitted for the sake of dispatch. This is evident; for when the word requiring the affirmation to be granted is supplied, the verb must be restored to its place in the middle of the clause. Such abbreviations, and such contrivances to mark them, are frequent in all languages, as will be seen more clearly when we come to treat of modes or moods. Upon the whole, then, we are compelled reluctantly to differ from this writer, and still to think that simple predication is the essence of the verb.

---

[1] The truth of this observation may be proved by experiment, as, for instance, by uttering to a man of good common sense these two propositions, taking care to express the words *God* and *man* in a language which he does not understand. Thus, *Deus* is *happy,* and *hic homo* is *happy,* uttered to a man totally unacquainted with the Latin tongue, will contain no notice of existence considered as mutable or immutable.

[2] *Theory of the Moods of Verbs,* published in vol. ii. of the Transactions of the Royal Society of Edinburgh.

Should we be required to exemplify our theory by language, and to produce instances of this simplified verb in practice, we might answer, that the not being able to produce such instances would be no good argument against the truth of our principles. It is the nature of language to express many circumstances by the same word, all of which, however, are not essential to distinguish the species to which that word belongs from the other species of words; and it is the nature of man to infer from discourse many things which are not actually expressed. Perhaps, however, something very nearly approaching to an exemplification of our idea of a simple verb will be found in the proposition, "The three angles of every plane triangle *are* equal to two right angles." What other office the verb *are* here performs than simply to join the subject and predicate, it is difficult to perceive. It does not give notice of time; or such notice, if given, is an imperfection; for the truth of the proposition is independent of time. Neither ought it to imply existence; for the proposition would be true were there neither a triangle nor a right angle in nature.

This idea of verb, when well considered, will be found just; but should any of our readers suspect it of novelty, and on that account be disposed to condemn it, we have only to request that he will restrain his censure till he has examined the writings of others, and nicely observed the several states of his own mind in discourse; for meditation may perhaps show him that our theory is not false, and inquiry will satisfy him that it is not novel.[1]

But although it is certain that assertion, and assertion only, is essential to the verb, yet the greater part of that species of words which grammarians call *verbs* are used to denote an attribute as well as an assertion; or, in the language of logic, they express both the copula and the predicate of a proposition; thus, *he liveth, he writeth, he walketh*, are phrases equivalent in all respects to *he is living, he is writing, he is walking*. Now, of attributes, some have their essence in motion, as *walking*; some in the privation of motion, as *resting*; and *others* have nothing to do with either motion or its privation, as *white* and *black*. But all motion and all privation of motion imply *time* as their concomitant; and a substance may have an attribute to-day which it had not yesterday, and will not have to-morrow. This is self-evident; for a man may be at rest to-day who yesterday was walking, and to-morrow will be on horseback; and a sheet of paper may have been white yesterday which to-day is black, and at some future time will be of a different colour. As, therefore, all motions and their privations imply time; and as a proposition may be true at one time which is not true at another, all *verbs*, as well those which denote both an attribute and an assertion, as those which denote an assertion only, come to denote *time* also. Hence the origin and use of *tenses*, which are so many different forms assigned to each verb, to show, without altering its principal signification, the various *times* in which the assertion expressed by it may be true. Whether these various forms of the verb be essential to language, it is vain to dispute. They have place in every language with which we are acquainted; and as the use of the verb is to affirm one thing of another, it is absolutely necessary that the *time* when such or such an affirmation is true be marked by *tenses*, or some other contrivance. Concerning tenses, therefore, we shall throw together some observations, which, *mutatis mutandis*, are applicable to every language, premising only a general remark or two which seem necessary in order to proceed with precision.

Time, although its essence consists in succession continued and unbroken, may yet be considered by the mind as divided into an infinite number of parts. There is, however, one grand division which necessarily occurs, and to which the different *tenses* of verbs are in all languages adapted. Computing from some portion conceived to be

---

[1] "Besides words, which are names of ideas in the mind, there are a great many others that are made use of to signify the connexion that the mind gives to ideas or propositions one with another. The mind, in communicating its thoughts to others, does not only need signs of the ideas it has then before it, but others also to show or intimate some particular action of its own at that time relating to those ideas. This it does several ways; as IS and IS NOT are the general marks of the mind affirming or denying." (Locke on *Human Understanding*.) "Verbum est pars orationis variabilis, aliquid de re aliqua dici seu affirmari significans. Vulgaris vero definitio est, quod, sit pars orationis, quæ agere, pati, aut esse significet. Sed nostra accuratior, magisque ex ipsa verbi cujusvis natura petita videtur. Cæterum *το affirmari* laxiore hic sensu accipimus, pro eo quod prædicari dialectici appellent, quo non modo affirmationes strictius sic dictæ, sed negationes etiam interrogationesque includuntur." (Ruddiman, *Grammaticæ Institutiones*; see also Beattie's *Theory of Language*.)

Verbs.

present, all time is either *past* or to *come*. Hence the tenses of verbs are threefold; some denoting time *present*, some time *past*, and others time *future*.

Again, from the very nature of time, it must be obvious that all its parts are relative; or, in other words, that no portion of it can be ascertained by any thing *inherent in itself*, but only by referring it to some other portion, with respect to which it is past, present, or to come. In this respect time is perfectly analogous to space; for as the space in which any object exists cannot be described but by stating its relation to some other space, so neither can the time of any attribute or action be determined, but by stating its relation to some other time. When, therefore, we would mark the time of any action or event, we must previously fix upon some point to which we may refer it. If this point be known, the time referred to it will also be known; but if the former be not known, neither will the latter.

Lastly, in contemplating an *action*, we may have occasion to consider it as *going on*, or as *finished*. This distinction is likewise denoted by the different tenses of verbs. In treating, therefore, of the tenses, there are two things to which attention ought principally to be turned;—the *relation* which the several tenses have to one another in respect of time; and the notice which they give of an action's being *completed* or *not completed*.

Having premised these remarks, we proceed now to the tenses themselves; of which Mr Harris has enumerated no fewer than twelve. Of this enumeration we can by no means approve; for, without entering into a minute examination of it, nothing can be more obvious, than that his inceptive present, *I am going to write*, is a *future* tense; and his completive present, *I have written*, a *past* tense. But, as was before observed of the classification of words, we cannot help being of opinion, that to take the tenses as they are commonly received, and endeavour to ascertain their nature and their differences, is a much more useful exercise, as well as more proper for a work of this kind, than to raise, as might easily be done, new and hypothetical theories on the subject.

It has already been observed that all the tenses must necessarily mark *relative time*. In one sense this is extremely obvious. The present tense is used in contradistinction to both the past and future, and marks an attribute or action as existing in neither. The past and the future are in like manner used in contradistinction to the present, and mark an attribute or action which exists not now, but which in the one case has existed formerly, and in the other will exist at some time coming. But besides this relation of contradistinction subsisting among the tenses, there is another of co-existence, as we may call it, to which it is of great consequence to attend, especially in examining the nature of the present.

The present tense refers not only to something which is past or future, but also to something with which the attribute or action of the verb is contemporary. This reference is necessarily implied in its very name; for we cannot say of any thing that it is present, without implying at the same time that there is something else with which it is present. Hence it appears with how little reason Mr Harris and others have given us an aorist of the present, as marking present time indefinitely in contradistinction to *other* presents, which have been called *inceptive*, *extended*, and *completive presents*. For from what has been said, it follows, that the present tense is necessarily and from its very nature perfectly indefinite, and can of itself give notice of no precise or determinate portion or point of time whatever. A thing may have been present fifty years ago, may be present now, or at any future period. This tense implies the relation of co-existence between two or more things; but without some auxiliary circumstance, it cannot in any language mark the particular portion of time in which those things exist. The indefinite nature of this tense is indeed most clearly seen in that use of it in which Mr Harris has styled it the aorist of the present; that is, in cases where it is employed to denote the repetition of an action which the agent is accustomed frequently to perform, or to express propositions of which the truth is evinced by general experience; as in the following examples:—

> Hypocrisy......the only evil that *walks*
> Invisible, except to God alone.
>
> *Ad pœnitendum* properat *qui cito judicat.*

In these instances it is plain that there is no particular time pointed out; the propositions are *true*, or apprehended as true, at all times. Although the actions, therefore, of "walking" and "hastening" are expressed as present, it is impossible from the expressions to determine any precise point of time when they are present.

But if the *present tense* be thus indefinite, how, it may be asked, are we to ascertain the particular time which is intended? We answer, it is to be ascertained, either by stating the action of the verb as existing in some time already known, or by inference. If, for example, we say, "Millions of spiritual creatures *walk* the earth unseen," the proposition is general, and the time of walking undetermined. But if we add, "both *when* we *wake* and *when* we *sleep*," the *time* is by this addition ascertained and specified; for if the time when men wake and sleep be known, the time when these spirits walk the earth is also known. When no specifying clause is given by which to determine the time of the present tense, it is very commonly determined by inference. Thus, if one use such an expression as "He *sleeps* while I am *speaking to him*," the time of his sleeping is ascertained by the subsequent clause of the sentence; but if it be said simply, "he sleeps," without assigning any data from which it may be concluded when his sleeping is present, we very naturally infer that it is at the instant when we receive the information of his sleeping. Such inferences as this are common in language. The mind is desirous to obtain complete information on every subject, and therefore frequently supplies to itself what is not expressed in the speech of others.

Both these ways of ascertaining the precise time of the present tense are excellently illustrated by the use of the word present as applied to space. Take a familiar example: "His brother and he were *present* when I read the letter." It is at first sight evident that this expression is perfectly indefinite. But if it be said, "His brother and he were *present at your house* when I read the letter," the place of action is then determined by being referred to a portion of space which is known. If no such reference be made, the person who hears the speech uttered must either remain ignorant of the place intended, or he must ascertain it to himself by inference; and he will probably infer it to be that in which the speaker is at the time of his uttering the indefinite sentence. This leads us to observe, that such inferences are not often made without sufficient foundation. Various circumstances may assist the reader or hearer in making them, and prevent all danger of mistake. He may have the evidence of sense, or of something preceding in the discourse, and a number of other particulars, to warrant his conclusion. Thus, if, when sitting by a large fire, any one pronounce the words "I am too warm," those to whom he addresses his speech are authorized to conclude that he is too warm at the time of speaking, unless he expressly prevent the drawing of that conclusion by adding some such clause as "when I wear a great coat."

It is strictly demonstrable, and has been in fact demonstrated by Mr Harris, that there is no such thing as present time. Yet do we not only conceive time as present

Verbs.

and existing, but frequently as extended to a very great degree. We speak not only of the present instant, or the present day, but also of the present year, and even of the present century. This manner of conceiving time is indeed loose and unphilosophical, but it is sufficient for the ordinary purposes of language. To express time as it really is, we ought to say, the passing day, the passing year, and the passing century; but in common discourse we denominate any portion of time present, in which the present now or instant is included, although it is obvious that part of that portion is past, and the remainder of it future. From the very nature of time thus conceived to be present, the tense now under consideration must represent the action of the verb as commenced, and not finished; for as time is in continued succession, and accompanies every action, when any action is *not* commenced, it exists not in any time, although it may exist hereafter in time which is now future; and when it is finished, it exists no longer in time present, but in *time past.* Hence the absurdity of introducing into a theory of the tenses an inceptive present and a completive present; for these terms imply each a direct contradiction.

After having said so much respecting the present tense, we shall have but little to say of the *præter-imperfect.* It states an action in regard to time as *past;* and in respect of progress, as *unfinished.* *Legebam,* I was reading at some time, but my reading was then incomplete; I had not finished the book or the letter. We must here observe, however, as we did with respect to the present tense, that although the præter-imperfect represents the action as past, it does not inform us in what precise portion of past time the unfinished action was going on; this circumstance must either be given in separate words, or be inferred by the hearer. If one say simply, *Legebam,* the person to whom he addresses his speech will conclude that the time of his reading is past with respect to the present time of his speaking. But if he say *Legebam antequam venisti,* he expressly states the action of reading as past with respect to the time in which his hearer came to the place where they both are at the time of speaking. The time of the præter-imperfect is always past with respect to the present instant when the imperfect is used, and of this the tense itself gives notice; but it may also be past with respect to some other time, and of this it conveys no information.

If we join two præter-imperfects together, the expression will state the co-existence of two progressive actions, both of which were going on at a time *past* in respect of some determinate time given or supposed. *Cum tu scriberes ego legebam;* "when you were writing I was reading." Hence the præter-imperfect has by some grammarians been called the relative present; a name which, however, is by no means exclusively applicable to this tense. When the præter-imperfect is by the conjunction *and* joined in the same sentence with a plusquam-perfect, the two tenses express two actions, both prior to the time of speaking; but the one as having continued after the other was finished. Thus Æneas, speaking of the destruction of Troy, says, that after having escaped with his father and followers, he returned to the city in quest of his wife, and went directly to his own house; but there, continues he, *Irruerant* Danai, et tectum omne *tenebant,* "the Greeks *had rushed in,*" that action was over and completed *before his arrival;* but the act of "possessing the whole house," *tenebant,* was not over, but still continuing.

But it is necessary that the verb should denote actions which were complete or perfect in past time, as well as those which were incomplete or imperfect. For this purpose Greek and English verbs have an aorist, a præter-perfect, and a plusquam-perfect. Of these the Latin has only the two last. The præter-perfect in that language sustains a twofold character; it performs the office of the Greek and English aorist, as well as that of the præter-perfect properly so called; that is, it denotes a finished action at some indefinite past time, as well as at some time which is both past and definite.

In attempting to analyse the signification of complex terms, by which we here mean words that include in their signification a variety of particulars, it is of great advantage to have these particulars separately expressed by different words in another language. Now the English has resolved the tenses, which in the Greek and Latin languages are denominated the aorist and the præter-perfect, by means of what are commonly called auxiliary verbs, expressing the former by the verb *did,* and the latter by the verb *have.* In examining therefore the aorist and præter-perfect, it will be of use to inquire into the import of these verbs.

Did is evidently the aorist of the verb *to do;* a verb of the most general signification, as it denotes action of every kind. It expresses the finished performance of some action, the completion of which must of course have taken place in some portion of *past time:* "*I* DID *write,* or *I wrote* (these expressions being equivalent) yesterday, a month, a year ago." But the import of *did* being so very general, it can convey no determinate meaning without being limited by the addition of some particular action; and this addition, however expressed, is to be considered in the same light as an accusative case, governed by the active verb *did;* for it produces exactly the same effect. Ἔγραψα, *scripsi,* I *did* WRITE; that is, "at some past time I performed the *action* of *writing,* and *finished it.*"

The verb *have,* which is included in the præter-perfect, is plainly a verb of the present tense denoting possession, But a man may possess one thing as well as another; and therefore *have* requires limitation, for the very same reason that *did* requires it, namely, because its signification is perfectly general. Now this limitation, whatever it is, must be conceived as the thing possessed; and in instances where *have* is limited by a noun, this is obvious, and universally acknowledged. "I *have* a gold watch," means "I *possess* a gold watch." But to annex the same meaning to the word *have,* when used as an anxiliary verb, is an idea we believe not common, and which may perhaps be thought whimsical; yet what other meaning can be affixed to it? To suppose that words have not each a radical and determinate signification, is to suppose language a subject incapable of philosophical investigation; and to suppose, with Mr Harris, that there are words entirely devoid of signification, is at once to render all inquiries into the principles of grammar nugatory and ridiculous. We conceive, then, that each of the phrases, γεγραφα ἐπιστολην, *scripsi epistolam,* I HAVE *written a letter,* is equivalent to the phrase, "I *possess* at present the *finished action* of writing a letter." Such an expression may sound harsh to the ear, because it is not in use; but we often employ expressions, to the precise and proper meaning of which we do not attend; and if the above be attentively considered, however awkward it may at first appear, nothing will be found in it either improper or absurd.

The aorist, then, we conceive to state an action as performed and finished in some past portion of time; whilst the præter-perfect represents the past performance and completion of that action as *now* possessed. And here we may hazard a conjecture why *have,* when used as an auxiliary verb, is always joined with a past participle; whereas *did* is joined to a word expressing the simple action of the verb, or, as it is called, present infinitive. Of the expression, "I *have* WRITTEN a letter," *one* part, namely, the verb *have,* denotes *present time;* the other part, viz. *written,* must denote past time, to give notice that the action is performed and finished. *Did,* on the other hand, implying past time, has no occasion for the past part of another verb to give notice of this circumstance; for "I *did* WRITE a letter," is equivalent to, "at some past time I performed and finished the simple action of writing a letter."

The principal distinction in practice between the aorist and præter-perfect (for the difference seems little in their real import) consists in the time by which the performance of the action admits of being particularly specified. The præter-perfect is always joined with a portion of time which includes the present *now* or *instant;* for otherwise it could not signify, as it always does, the present possession of the finishing of an action. But the aorist, which signifies no such possession, is as constantly joined with a portion of past time which excludes the present *now* or *instant.* Thus we not only say, "I *have written* a letter *this* day, *this* week," but "I *wrote* a letter *yesterday*, last week;" and to interchange these expressions of time in Greek and English, where the aorist and præter-perfect have different forms, would be improper. In Latin, indeed, where they have but one form, the impropriety does not appear.

Besides the tenses already examined, which are expressive of past time, in most languages the verb has another tense called the *plusquam-perfect*, in which, however, no difficulty occurs to detain our attention. What the præter-imperfect is to the present tense, that the plusquam-perfect is to the præter-perfect. The verb *had*, by which it is resolved in English, being evidently the past time of *have*, sufficiently explains its meaning and relation to the other tenses. "I *had* written a letter," is equivalent to the phrase, "I *possessed* at some *past time* the finished action of writing a letter." It is justly observed by Dr Beattie, that the imperfect and plusquam-perfect are very useful, and may be the sources of much elegant expression; and that if one were not taught to distinguish, in respect of meaning as well as of form, these tenses from each other, and the præterite from both, one could not pretend to understand, far less to translate, any good classic author.

Having considered the tenses which imply present and past time, it now remains that we examine the import of those which are expressive of time *future.* In Latin and English there are two tenses for this purpose, of which the first represents an action in point of time as *not yet existing*, but as about to exist at some period to come; but it does not bring the completion of the action into view. The other asserts the *futurity* of an action together with its completion. *Scribam*, "I shall be writing," denotes *future* time and *incomplete action;* for it does not say whether I am to write for a long or for a short time, or whether I shall finish what I promise to begin. This part of the verb, therefore, to which the Greek γϱαψω corresponds, is an imperfect future, or, in other words, indefinite. The futurity of any action, it should seem, may always be computed from the time of speaking; for every action must be future with respect to the time at which its futurity is declared: but the time of its futurity may be more precisely specified by fixing upon some other future time to which to refer it: "I shall be writing after he shall have departed." *Shall* or *will* refers to future time indefinitely; and *write* or *writing* refers to an action which is indeed to *begin* and so far to proceed, but of which nothing is said concerning the completion.

On the other hand, *scripsero*, "I shall have written," is a perfect future denoting complete action; for *shall* denotes future time; *written*, finished action; and *have*, present possession. So that the meaning of the whole assertion is, that "at some future period of time I shall possess the finished action of writing." The completion of the action, together with the possession of it, is always future with respect to the time of assertion; but, with respect to some other time expressed or understood, the completion of the action is to be past: *Promittis te scripturum si rogavero*, "you promise to write if I shall have asked you." In this sentence the action of asking is future with relation to the time of promising, but it is past with relation to that of writing. This tense the Latin grammarians call the future of the subjunctive mode, but very improperly. The notice which it communicates respects not the power or liberty of acting, which, as will be seen by and by, is the characteristic of that mode; but only the action itself. It ought, therefore, to be ranked among the tenses of the indicative mode; for *scripsero* is, in every sense, as really indicative as *scribam* or *scripturus ero.*

These are all the tenses, essentially different from each other, which have place in the indicative mode (or mood) of any language with which we are acquainted;[1] but as there are tenses in the mode called *subjunctive*, which bear the same names with those already examined, and which have yet a different import, it will be necessary to consider them before we dismiss the subject of tenses. Of *modes* in general something will be said hereafter; at present we shall only observe, that the mode with which we are now concerned is not very properly distinguished by the name assigned to it by the Latin grammarians. They call it the *subjunctive*, because it is often subjoined to another verb, and forms the secondary clause of a sentence; but the mode called *indicative* frequently appears in the same circumstances. The difference between these two modes appears to us to consist in this, that the indicative asserts something directly concerning the action, and the subjunctive, something concerning the power or liberty of the agent to perform it; for that the latter asserts as well as the former, admits not of dispute.

The present tense of the *subjunctive mode*, in the learned languages, answers to the English auxiliaries *may* and *can.* Let us consider these a little. *May* is evidently a verb of the present tense denoting *liberty.* When I assert that I MAY *write*, I give notice that I am under no *compulsion* to *abstain* from writing; that there is no impediment from without by which I am restrained from writing. *Can* is also a verb of the present tense, expressive of internal power or skill. "I *can* write" is equivalent to such an expression as this: "There is nothing in myself which incapacitates me for performing the operation of writing." This verb seems originally to have denoted knowledge or skill, and to have been afterwards extended to signify power or ability of any kind. There is little doubt of its being the same with the old English verb *to con*, which signifies *to know*. The difference between the import of these two verbs, *may* and *can*, will be best perceived in a familiar example. Suppose we say to any one, "You *may* write a treatise on grammar," to which he returns for answer, "I *cannot*;" our assertion evidently supposes him at liberty to write the treatise; his answer implies that he is unable or unskilled to do it. We may conclude, then, that the present tense of this mode contains a declaration of present liberty, ability, or skill; and its other tenses will be found to have reference to the same capacities.

---

[1] "It will perhaps occur," says an elegant and ingenious writer, "that there are two Greek tenses of which I have given no account; namely, the *second aorist* and the *second future.* The truth is, that I consider them as unnecessary. Their place, for any thing I know to the contrary, might at all times be supplied by the *first aorist* and the *first future.* Some grammarians are of opinion that the first aorist signifies time past in general, and the second indefinite time past; and that the first future denotes a nearer, and the second a more remote, futurity. But this, I apprehend, is mere conjecture, unsupported by proof; and therefore I incline rather to the sentiments of those who teach that the second future and the second aorist have no meaning different from the first future and the first aorist; and that they are the present and imperfect of some obsolete theme of the verb; and when the other theme came into use, happened to be retained for the sake of variety perhaps, or by accident, with a preterite and future signification. Be this as it will, as these tenses are peculiar to the Greek, and have nothing corresponding to them in other tongues, we need not scruple to overlook them as superfluous." (Beattie on the *Theory of Language*, part ii. chap. 2.) To these judicious observations we have nothing to add, except that they acquire no small degree of confirmation from the circumstance that there are many Greek verbs which have no second future, and which are yet employed to denote every possible modification of future time. Of the *paulo-post-futurum* of the Greeks we have taken no notice, because it is found only in the passive voice; to which, if it were necessary, it is obvious that it would be necessary in *all* voices, as a man may be about to *act* as well as to *suffer* immediately.

The observation is here to be repeated which was enlarged upon when treating of the present of the indicative. The liberty or ability signified by this tense is always represented as present, but the time of this presence is indefinite. If no particular time be specified, we generally refer it to the time of speaking; but another point may be given from which we are to compute. "When he shall have finished, you *may* then proceed as you propose." Here the liberty of proceeding is stated as present, not at the time of speaking, but at the time of his finishing, which is future to the time of speaking. But though the liberty, ability, or skill, denoted by this tense, be represented as present, the action itself is stated as *contingent*; for it is not necessary that a man should perform an action because he has the capacity to perform it.

From this idea of the present of the subjunctive some of its most peculiar uses seem capable of being explained. And, in the first place, it appears to have a near affinity with the future of the indicative, insomuch that in many instances they may be used promiscuously. Without materially altering the effect of the expression, we may say, "Dico me facturum esse quæ *imperet*," or "quæ *imperabit*." The reason of this, perhaps, may be, that with respect to us, *futurity* and *contingency* are in most cases nearly the same, both being involved in equal obscurity; and therefore it is often of little consequence which mode of expression we employ.

Secondly, the present of the subjunctive is used to denote the right of which a person is possessed. "*I may*, or *can*, sell this book." This application, which Dr Priestley considers as the primary signification of the tense, is easily deduced, or rather it follows immediately from the foregoing account of its import. For if one be under no restraint, either external or internal, to prevent him from performing an action, he has surely a right to perform it.

Thirdly, the present of the subjunctive is often used to signify command or request; as when one says, "You *may give* my compliments to such a person." This use of the tense under consideration seems to have arisen from a desire to soften the harshness of a command, by avoiding the appearance of claiming superiority. When a man utters the above sentence, he certainly utters no command, but only asserts that the person to whom he speaks has liberty or power to do him a favour. This assertion, however, may contain no new information; and therefore the person addressed, reflecting upon the intention of the speaker in making it, infers that it indicates a *wish* or *desire* that his compliments should be made to such a person.

Of the subjunctive as well as of the indicative, the præter-imperfect is evidently the past time of the present. As the latter asserts liberty or ability to perform some action, as existing at present, the former asserts the same liberty or ability to have existed in time past; but the precise portion of time past in which these capacities existed must be specified by other words, or it will remain unknown. Thus, in the following sentence, "Dixi me facturum esse quæ *imperaret*," the time of *imperaret* is referred to that of *dixi*; the person having the right to command is supposed to have had it at the time when the other said that he would obey. This tense, as well as the present, states the action as going on and incomplete; and also as future with respect to the liberty or ability to perform it. It is rendered into English by the verbs *could* or *might*, of which the first is the past time of *can*, and the second of *may*. From the near affinity which the present of the subjunctive has to the future of the indicative, the tense now under consideration appears in many instances as the past time of the latter as well as the former. Thus, *Dixi me facturum quæ imperaret*, may be rendered "I said that I would do whatever he might, or whatever he *should*, command."

Of the præter-perfect it is sufficient to observe, that as the present states the agent as at *liberty* to be performing an unfinished action, so this tense states him as at liberty to perform the action considered as finished. "I *may be writing* a letter when you come;" that is, "I *am at liberty to be writing* a letter when you come." "I *may have written* a letter when you come;" that is, "I *am at liberty to be in possession of the finished action* of writing a letter when you come." It is a common mode of expression to say, "I may have done such or such a thing in my time," when he who speaks can have little doubt whether he has done the thing or not. In that case, the words *may have done*, cannot be considered as the præter-perfect of the subjunctive of the verb *do*; for it is nonsense to talk of liberty with respect to the performance of an action, which at the time of speaking is supposed to be past and completed. What, then, is the import of the phrase? We are persuaded that it is elliptical, and that the word *say* or *affirm* is understood: "I may (say that I) have done such or such a thing in my time;" for liberty or contingency can relate to actions only as they are conceived to be present or future.

Of all the tenses, the most complex is the plusquamperfect of this mode. It combines a past and a future time with a finished action. It may be considered as the past time both of the perfect future and the præter-perfect of the *subjunctive*; for it represents an action, future and contingent at some *past time*, as *finished before* another *period specified*; which period, therefore, though past at the time of speaking, was itself future with respect to the time when the futurity or contingency of the action existed. "Promisisti te scripturum fuisse si *rogassem*;" "You promised that you would write, if I should have asked you." Here the futurity of the action of *asking*, which is represented as complete and finished, is stated as *co-existing* with the *past promise*; but the action itself must be *posterior* to that promise. It is however supposed to be past with respect to the action of writing, which is also posterior to the promise.

Before we dismiss the subject of tenses, it may not be improper just to mention number and person; for these have place in every tense of the verb in the learned languages, and in many tenses even of the English verb. They cannot, however, be deemed essential to the verb; for affirmation is the same, whether it be made by you, by me, or by a third person, or whether it be made by one man or by a thousand. The most that can be said is, that verbs in the more elegant languages are provided with a variety of terminations which respect the number and person of every substantive, that we may know with more precision, in a complex sentence, each particular substance, with its attendant verbal attributes. The same may be said of sex with respect to adjectives. They have terminations which vary as they respect beings male or female, though it is past dispute that substances alone are susceptible of sex. We therefore pass over these matters, and all of like kind, as being rather amongst the elegancies of particular languages, and therefore to be learned from the particular grammar of each tongue, than amongst the essentials of language; which essentials alone are the subject of inquiry in a treatise on universal grammar.

Besides tenses, number, and person, in every tongue with which we are acquainted, verbs are subject to another variation, which grammarians have agreed to call *modes* or *moods*. Of modes, as of tenses, it has been warmly disputed whether or not they be essential to language. The truth seems to be, that the only part of the verb absolutely necessary for the purpose of communicating thought is the indicative mode; for all the others, as has been well observed by Dr Gregory, are resolvable, by means of additional verbs and a word denoting the action of the primary verb, into circuitous expressions which fully convey their meaning.[1] But such expressions continually repeated would make language very prolix and wholly devoid of animation; and for this reason the import of each of the commonly received modes is a subject worthy of the philologist's investigation. About the number of modes, whether necessary or only expedient, as well as about the import of each, the writers on grammar have differed in opinion. Mr Harris, one of the most celebrated of those writers, has enumerated four modes of the verb, besides the infinitive: viz. the *indicative* or *declarative*, to assert what we think certain; the *potential* or *subjunctive*, for the purposes of whatever we think contingent; the *interrogative*, when we are doubtful, to procure us information; and the *requisitive*, to assist us in the gratification of our volitions. The requisitive, too, according to him, appears under two distinct species; either as it is *imperative* to inferiors, or *precative* to superiors. For establishing such a variety of modes as this, there appears to be no sort of foundation whatever. The same reasoning which induced the author to give us an interrogative and requisitive mode, might have made him give us a hortative, a dissuasive, a volitive, and innumerable other modes, with which no language is acquainted. But besides perplexing his reader with useless distinctions, we cannot help thinking that Mr Harris has fallen into some mistakes with regard to the import of those modes which are universally acknowledged. According to him, *assertion* is the characteristic of the indicative, and that which distinguishes it from the subjunctive or potential; but this is certainly not true, for, without an assertion, the verb cannot be used in any mode. Of this the learned author indeed seems to have been aware, when he observed respecting the subjunctive mode, that it is employed "when we do not *strictly* assert," and that "it implies but a *dubious* and *conjectural* assertion." The truth is, that the assertion implied in this mode, though it is not concerning the same thing, is equally positive and absolute with that conveyed by the indicative. An example quoted by himself should have set him right as to this matter:

> Sed tacitus pasci si posset corvus, *haberet*
> Plus dapis.

Who does not feel that the assertion contained in *haberet* is as absolute and positive as any assertion whatever?

Perhaps we may be asked to define what we mean by a mode. We know not that we can define it to the satisfaction of all. Thus much, however, seems to be obvious, that those variations which are called modes do not imply *different modifications* of the *action* of the verb. *Amo*, *Amem*, *Ama*, do not signify modes of *loving;* for modes of loving are, loving *much*, loving *little*, loving *long*, loving *short*, and the like. Shall we then get over the difficulty by saying, with Mr Harris, that "modes exhibit some way or other the *soul* and its *affections?*" This is certainly true, but it is nothing to the purpose; for it does not distinguish the meaning of mode from the object of language in general, all languages being intended to exhibit the soul and its affections.

Grammatical modes of verbs have been defined by Dr Gregory to be "concise modes of expressing some of those combinations of thoughts which occur most frequently, and are most important and striking." This is a just observation; but perhaps he would have given a more complete definition had he said, that grammatical modes of verbs are concise modes of expressing some of those combinations of thoughts which occur most frequently, and of which *assertion* is an essential part.[2] This indeed seems to be the real account of the matter, especially if our notion of the nature of verb be well founded, that its essence consists in affirmation. And in this opinion we are the more confirmed, from a conviction that no man ever employs language on any occasion but for the purpose of affirming something. The speaker may affirm something directly of the action itself, something of the agent's power or capacity to perform it, or something of his own desire that it should be performed, but still he must affirm. If this be so, then are all the modes equally indicative. Some may be indicative of perceptions, and others of volitions; but still they all contain *indications.* On this idea the three foregoing modes of *amo* will be thus distinguished: When a man indicates his present *feeling* of the passion of love, he uses the first; when he indicates his present *capacity* of feeling it, he uses the second; and when he indicates his present *desire* that the person to whom he is speaking would entertain that passion, he uses the third.

---

[1] The imperative, for instance, may be resolved into a verb of commanding in the first person of the present of the indicative, and a word denoting the action of the primary verb, commonly called the infinitive mode of that verb. Thus, *I nunc et versus tecum meditare canoros*, and *Jubeo te nunc ire et tecum meditari*, &c. are sentences of the very same import. The subjunctive may be resolved in the same manner by means of a verb denoting power or capacity; for *credam*, and *possum credere*, may often be used indifferently. The indicative mode, however, is not thus convertible with another verb of affirming in the first person of the present of the indicative, and a word denoting the action of the primary verb; for *Titius scribit*, "Titius writes," is not of the same import with *dico Titium scribere, quod Titius scribat*, "I say that Titius writes." The first of these sentences, as has already been shown, contains but one assertion; the second obviously contains two. *Titius writes*, is equivalent to *Titius* IS *writing; I say that Titius writes*, is equivalent to *I* AM *saying that Titius* IS *writing*. The reason why the imperative and subjunctive are resolvable into expressions into which the *indicative* cannot be resolved, will be seen when the import of each of those modes is ascertained.

[2] Every verb, except the simple verb *am*, *art*, *is*, &c. expresses without modes a combination of thoughts, namely, affirmation and an attribute. The affirmation, however, is alone essential to the verb, for the attribute may be expressed by other words. It is indeed extremely probable, that in the earliest ages of the world, the affirmation and attribute were always expressed by different words; and that afterwards, for the sake of conciseness, one word, compounded perhaps of these two, was made to express both the affirmation and the attribute; hence arose the various classes of verbs, *active*, *passive*, and *neuter*. Of a process of this kind there are evident signs in the Greek and some other tongues. But the improvers of language stopped not here. The same love of conciseness induced them to modify the compound verb itself, that it might express various combinations of thought still more complex; but in all these combinations *assertion* was of necessity included; for if the word had ceased to assert, it would have ceased to be a verb of any kind.

As to what Mr Harris calls the interrogative mode, he observes that it has a near affinity to the indicative. It has in fact not only a near affinity to it, but, as far as language is concerned, there is not between the one and the other the slightest difference. For, in written language, take away the mark of interrogation, and, in spoken language, the peculiar tone of voice, and the interrogative and indicative modes appear precisely the same. That such should be the case is extremely natural. To illustrate this, let us for once speak in the singular number, and conceive one of our readers to be present. "I assert a thing, taking the truth of it for granted; but if you know me to be wrong, I presume that you will set me right." In this case, assertion produces the same effect as interrogation. Instances of the same kind perpetually occur in common conversation. An acquaintance says to me, "You took a ride this morning." I answer yes or no, according to the case; and the same effect is produced as if he had said, "Did you take a ride this morning?" In this way simple assertions would at first be employed to procure information wanted. *Fecisti*, you did such a thing; *fecisti ne*, you did it *not;* either would produce the proper reply, and the information wanted would be gained.[1] This being observed as language improved, men would accompany such a sentence with a peculiar tone of voice, or other marks, to signify more unequivocally that they wanted information, or that such information was the only object of their speech. Further progress in refinement would lead them to alter the position of the words of a sentence when they meant to ask a question, as we do in English, saying, when we *assert*, "*You have* read Euripides," and when we *interrogate*, "*Have you* read Euripides?"

In Greek and Latin, questions are asked commonly enough by the particles ἐι and *an*. These particles we know to be exactly equivalent to the English particle *if*, at least to the sense in which that particle is commonly taken. *An fecisti*, is "*If* you did it;" and the sentence may either be an abbreviation for *dic an fecisti*, "tell me if you did it;" or *an* may perhaps be, as *if* certainly is, the imperative mode of some obsolete verb equivalent to *give;* and in that case, *an fecisti* will be a complete interrogative sentence, signifying, "you did it, *give that*." But of the interrogative mode of Mr Harris we have said enough; perhaps our readers will think too much, since it is a useless distinction not found in any language. It will, however, be proper to say something of his precative mode, as far as it is the same with the optative mode of the Greek grammarians.

And nothing, we think, can be clearer, than that the Greek optative constitutes no distinct mode of the verb, whatever meaning be annexed to the word mode. The different tenses of the optative are evidently nothing but the past tenses of the corresponding tenses of the subjunctive. Thus, pres. subj. τυπτω, I *may* strike; pres. optat. τυπτοιμι, I *might* strike, &c. This is proved to be indubitably the case by the uniform practice of the Greek writers. Examples might be found without number were one to read in search of them. The following sentence will illustrate our meaning: 'Ερχονται 'Αθηναιοι ἱνα βοηθωσι τοις Αργειοις, "The Athenians *come* that they *may assist* the Argives." Here the leading verb ἐρχονται being of the present tense, the dependent verb βοηθωσι is the present subjunctive. But change the former to the *past time*, and the latter must also be changed. 'Ηρχοντο 'Αθηναιοι ἱνα βοηθοιεν τοις 'Αργειοις, "The Athenians *came* that they *might assist* the Argives." Here it is plain that βοηθοιεν, the present of the optative, is the past time of βοηθωσι, the present of the subjunctive; and the same holds in other instances.

It is almost unnecessary to add, that when this mode is employed to denote a wish, the wish is not expressed by the verb, but is understood. Such abbreviated expressions to denote a wish are common in all languages. Thus, in Greek,

> 'Υμιν μεν θεοι δοιεν, ὀλυμπια δωματ' ἐχοντες
> 'Εκπερσαι Πριαμοιο πολιν, κ. τ. λ.

signifies, "The gods might give you (or, as we say in English, *changing* the position of the verb, *might the gods give you*) to destroy," &c. So in Latin, *Ut te omnes dii deæque perdant*, "That all the gods and goddesses may destroy you." Again, in English, "O that my head were waters, and my eyes a fountain of tears." In all these, and such like sentences, words equivalent to *I wish, I pray*, are understood. In Greek a wish is sometimes introduced by the particle ἐι or ἐιτε, *if;* as in Homer,

> 'Ειθ' ὀφελες τ'αγονος τ'ἐμεναι, ἀγαμος τ'ἀπολεσθαι.

"*If* it had been your fate not to be born, or to die unmarried." The supplement is, "It would have been fortunate for your country," or some such thing. In like manner, a poor person not uncommonly entreats a favour by saying, "Sir, *if* you would be so good." Here he stops; but the completion of his sentence is, "it would make me happy." In all these cases a wish is not formally expressed by the speaker, but inferred by the hearer. They are therefore instances of that tendency which mankind universally discover to abbreviate their language, especially in cases where the passions or feelings are interested.

The interrogative and optative modes being set aside as superfluous, it would appear from our investigation, that the real distinct modes of the verb, which are found in the most copious and varied language, are only three; the *indicative*, the *subjunctive*, and the *imperative:* And these are all that can be considered as *necessary;* the first to indicate the speaker's feeling or acting, the second to indicate his capacity of feeling or acting, and the third to indicate his desire that the person to whom he speaks should feel or act.

Here again we have the misfortune to differ in opinion from Dr Gregory, who seems to think that a greater number of modes, if not absolutely necessary, would, at any rate, be highly useful. His words are, "All languages, I believe, are defective in respect of that variety and accuracy of combination and of distinction, which we know with infallible certainty take place in thought. Nor do I know of any particular in which language is more deficient than in the expressing of those energies or modifications of thought; some of which always are, and all of which might be, expressed by the grammatical moods of verbs. Of this there cannot be a clearer proof than the well-known fact, that we are obliged to express by the same mood very different modifications or energies of thought. As, for instance, in the case of the grammatical mood called the imperative, by which we express occasionally prayer to God, command to a slave, request to a superior, advice to an equal or to any one, order as from an officer to his subaltern, supplication to one whom we cannot resist." If these be, as the author calls them, specific differences of thought, he will not surely object to their being all ranked under one genus, which may be called *desire.* That the internal feelings which prompt us to pray to God, to command a slave, to request a superior, to advise an equal, to give an order to an inferior, and to supplicate one whom we cannot resist, are all different in degree, cannot be denied. Each of them, however, is desire; and the predication by which the desire is made known to the person whom we address, is the same in all, when we utter a prayer as when we utter a command, when we request as when we supplicate. But predication alone is that which constitutes the verb; for desire by itself, however modified, can be expressed only by an abstract noun; and the mere energy of desire, when not applied to a particular agent, can be expressed only by a *participle*, or by what is commonly, though improperly, called the infinitive mode. Now it is certainly conceivable that a few shades of meaning, or a few degrees of one general energy, might be marked by corresponding variations of such verbs as combine energy with predication;[1] and there could be no great impropriety in calling those variations modes, or rather modes of modes; but that such a multiplication of modes would be an improvement in language, is by no means evident. The verb, with the modes and tenses which it has in all languages, is already a very complex part of speech, which few are able, and still fewer inclined, to analyse; and it would surely be of no advantage to make it more complex by the introduction of new modes, especially when those degrees of energy which could be marked by them are with equal and perhaps greater precision marked, in the living speech, by the different tones of voice adapted to them by nature; and, in written language, by the reader's general knowledge of the subject, and of the persons who may be occasionally introduced. If there be any particular delicacy of sentiment or energy which cannot thus be made known, it is better to express it by a name appropriated to itself, together with the simple and original verb of affirmation, than to clog the compound verb with such a multiplicity of variations as would render the acquisition of every language as difficult as is said to be that of the Chinese written characters. The indicative, subjunctive, and imperative, are therefore all the modes of the verb which to us appear to be in any degree necessary or expedient; and they are in fact all the modes that are really found in any language with which we are acquainted.

---

[1] Of a question put in the form of an assertion we have a remarkable instance in the gospel of St Matthew. When Christ stood before Pilate, the governor asked him, saying, Συ ἐι ὁ βασιλευς των Ιουδαιων, "Thou art the king of the Jews." That this sentence was pronounced with a view to obtain some answer, is evident from the context; yet it is as plainly *an affirmation*, though uttered probably in a scoffing tone, as the serious confession of Nathaniel, Συ ἐι ὁ βασιλευς του Ισραηλ, "Thou art the king of Israel." Had not the question been put in this form, which *asserts* Christ to be the king of the Jews, the reply could not have been Συ λεγεις, "Thou sayest;" for without an assertion the governor would have said nothing. (See Dr Campbell's *Translation of the Gospels*, where the form used in the original is with great propriety retained in the version.)

For the *infinitive*, as has already been observed, seems on every account to be improperly styled a mode. To that name it has no title which we can perceive, except that its termination sometimes (for even this is not universally true) differs in the learned languages from the terminations of the other parts of the verb. Nay, if affirmation be, as it has been proved to be, the very essence of verb, it will follow that the infinitive is no part of the verb at all; for it expresses no affirmation. It forms no complete sentence by itself, nor even when joined to a noun, unless it be aided by some real part of a verb either expressed or understood. *Scribo, scribebam, scripsi, scripseram, scribam, scripsero,* "I am writing, I was writing, I have written, I had written, I shall write, I shall have written," contain each of them an *affirmation*, and constitute a complete sentence; but *scribere* "to write," *scripsisse* "to have written," affirm nothing, and are not more applicable to any one person than to another. In a word, the *infinitive* is nothing more than an *abstract noun*,[2] denoting the simple

---

[1] Dr Gregory seems to think, that not merely a few, but a vast number, of these energies might be so marked. "*Affirming, denying, testifying*, foretelling, asking, answering, *wishing, hoping, expecting*, believing, knowing, doubting, supposing, stipulating, being able, commanding, *praying*, requesting, *supplicating*, loving, hating, fearing, despairing, being accustomed, wondering, admiring, wavering, swearing, *advising, refusing, exhorting, dissuading, encouraging*, promising, threatening, &c." says he, "all admit very readily of being combined with the general import of a verb." And he adds, that "if every one of them had been expressed in all languages by variations as striking as those of *τυπτω, τυπτοιμι*, and *τυπτε*, they must have been acknowledged as distinct moods of the verb."

If all these words denote different energies of thought, which, however, may be doubted, and if all those different energies, with many others for which, as the author justly observes, it is not easy to find names, could, like capacity and desire, be combined with the general action or energy of one verb; and if those combinations could be marked by corresponding variations of that verb; we should indeed acknowledge such variations to be distinct modes, or modes of modes, of the verb. But we doubt much if all this be possible. We are certain that it would be no improvement; for it seems to be evident, either that, in some of the modes, the radical letters of the original verb must be changed, and then it would cease to be the same verb; or that many of the modes must be expressed by words of very unmanageable length; not to mention, that the additional complication introduced by so many minute distinctions into a part of speech already exceedingly complex, would render the import of the verb absolutely unintelligible to nine tenths even of those who are justly styled the learned.

[2] In our idea of the infinitive, we have the good fortune to agree with the learned Ruddiman, whose words are, "Non inepte hic modus a veteribus quibusdam *verbi nomen* est appellatum. Est enim, si non vere ac semper, quod nonnulli volunt, nomen substantivum, significatione certe ei maxime affinis; ejusque vices sustinet per omnes casus. Et quidem manifeste substantivum videtur, cum adjectivum ei additur neutri generis; ut, Cic. *Att.* xiii. 28, *Cum vivere ipsum turpe sit nobis.* Pers. v. 53, *Velle suum cuique est.* Cic. *Fin.* i. 1, *Totum hoc displicet philosophari.* Petron. c. 52, *Meum intelligere nulla pecunia vendo.* Item, absque adjectivo, ut Ovid. *Met.* ii. 483, *Posse loqui eripitur*, id est, *potestas loquendi.* Plaut. *Bacch.* i. 2. 50, *Hic vereri perdidit*, id est, *verecundiam.* Cic. *Tusc.* v. 38, *Loquor de docto homine et erudito, cui vivere est cogitare*, id est, *cujus vita est cogitatio.*" See *Grammaticæ Latinæ Institutiones*, pars secunda, lib. i. cap. 2, where the reader will find examples of the infinitive used by the best Roman writers as a substantive noun in every case.

This opinion of Ruddiman and the ancient grammarians has been controverted with much ingenuity by Dr Gregory, who seems to think that in the infinitive alone we should look for the essence of the verb divested of every accidental circumstance, time only excepted. If this be indeed the case, almost every thing which we have said of the verb, its tenses, and its modes, is erroneous; and he who takes his principles of grammar from the Encyclopædia Britannica will fill his head with a farrago of absurdities. But it may without much difficulty be shown, that the error does not attach to the doctrine respecting the infinitive, which has been stated and illustrated in this article, but to the strange inversion of all recognised principle involved in the notion which Dr Gregory has espoused, apparently by reason of its novelty alone.

The Doctor acknowledges (*Transactions of the Royal Society of Edinburgh*, vol. ii. liter. class, p. 195), that the infinitive is most improperly called a mode, and on that account he thinks we ought to turn our thoughts exclusively to it, "when we endeavour to investigate the general import of the verb, with a view to ascertain the accident which it denotes, and be led, step by step, to form a distinct notion of what is common in the accidents of all verbs, and what is peculiar in the accidents of the several classes of them, and thereby be enabled to give good definitions, specifying the *essence* of the verb," &c. It may be true, that to the infinitive exclusively we should turn our attention when we wish to ascertain the accident denoted by a particular verb or class of verbs; that is, the kind of action, passion, or state of being, of which, superadded to affirmation, that verb or class of verbs is expressive; but in accidents of this kind it may be doubted if there be any thing that with propriety can be said to be common to all verbs. There seems indeed to be nothing common to all verbs but that which is essential to them, and by which they are distinguished from every other part of speech; but every kind of action, passion, and state of being, may be completely expressed by participles and abstract nouns, and therefore ergy of the verb, in conjunction with time; and is not mode as far as we can conceive of any thing. Thus, *cire tuum nihil est*, is the same with *Scientia tua nihil est*; nd "*Death* is certain," is identical with "*To die* is cer- in."

Before we dismiss the subject of modes, it may not be improper to take notice of the connection which Mr Harris, after Apollonius, has found between commanding and futurity. "Intreating and commanding," he says, "have a necessary respect to the future only. For what have they to do with the present and the past, the natures of which are immutable and necessary?" This is surely con-

---

such accidents we cannot find the essence of the verb, because such accidents distinguish it not from other parts of speech. Were man called upon to specify the essence of verse or metre, he would not say that it consists in the meaning of the words, or in the ing of these words according to the rules of syntax. In every kind of verse where words are used, they have indeed a meaning, and all good verses they are grammatically constructed; but this is likewise the case in prose, and therefore it cannot be the essence verse. The essence of verse must consist in something which is not to be found in prose, namely, a certain harmonic succession of unds and number of syllables; and the essence of the verb must likewise consist in something which is not to be found in any other rt of speech, and that is nothing but affirmation. But if affirmation be the very essence of the verb, it would surely be improper, hen we endeavour to ascertain the general import of that part of speech, to turn our thoughts exclusively to a word which implies affirmation; for what does not affirm, cannot in strictness of truth be either a verb or the mode of a verb.

In the same page it is said that "the infinitive denotes that kind of thought or combination of thoughts which is common to all the er modes." In what sense this is true we are unable to conceive; it denotes indeed the same accident, but certainly not the same ought or combination of thoughts. In the examples quoted, *Non est* VIVERE, *sed* VALERE *vita*, the infinitives have evidently the ect of abstract nouns, and not of verbs; for though *vivere* and *valere* express the same states of being with *vivo* and *valeo*, they by means express the same combination of thoughts. *Vivo* and *valeo* affirm that *I* AM *living*, and that *I* AM *well*; and he who utters ese words must think not of life and health in the abstract, but of life and health as belonging to himself. *Vivere* and *valere*, on the er hand, affirm nothing; and he who utters them thinks only of the states of living and of being in health, without applying them any particular person.

The learned author of *The Origin and Progress of Language* having said that the infinitive is used either as a noun, or that it serves connect the verb with another verb or noun, and so is useful in syntax, the doctor combats this opinion, and infers that the infi- ive is truly a *verb*, because "the thought expressed by means of it may be expressed in synonymous and convertible phrases, in ferent languages, by means of other parts or moods of the verb." Of these synonymous and convertible phrases he gives several amples, the first of which is taken from Hamlet's soliloquy. "*To be* or *not to be*, that is the question," he thinks equivalent in eaning to, "The question is, *whether we shall be or shall not be*." But we are persuaded he is mistaken. "Whether we shall be or all not be," involves a question, whether we shall exist at some future and indefinite time; but the subject of Hamlet's debate th himself was not, whether, if his conscious existence should be interrupted, it would be afterwards at some future and indefinite e restored, but whether it was to continue uninterrupted by his exit from this world. This, we think, must be self-evident to ery reader of the soliloquy. It is likewise obvious that the word "question" in this sentence does not signify interrogatory, but *ject of debate*, or *matter to be examined*; and that the word "that" serves no other purpose than to complete the verse, and give addi- nal emphasis, perhaps, to an inquiry so important. "*To be* or *not to be*, that is the question," is therefore equivalent in all respects "The continuance or non-continuance of my existence is the matter to be examined;" and the infinitive is here indisputably used an abstract noun in the nominative case. Should it be said that the doctor may have taken the sentence by itself, unconnected th the subject of Hamlet's soliloquy, we reply, that the supposition is impossible; for, independently of the circumstances with ich they are connected, the words "*To be* or *not to be*" have no perfect meaning. Were it not for the subject of the soliloquy, m which every reader supplies what is wanting to complete the sense, it might be asked, "*To be* or *not to be*"—*what?* A coward, a rderer, a king, or a corpse? Questions all equally reasonable, and which in that case could not be answered.

With the same view, to prove that the infinitive is truly a *verb*, the doctor proceeds to remark upon the following phrases, *Dico, edo, puto, Titium existere, valere, jacere, cecidisse, procubuisse, projecisse Mævium, projectum fuisse a Mævio*; which, he says, have the ry same meaning with *dico, quod Titius existat, quod jaceat, quod ceciderit*, &c. He adds, that "the infinitives, as thus used, acquire any further meaning, in addition to the radical import of the verb with tense, like the proper moods; but the subjunctives after *d* lose their peculiar meaning as moods, and signify no more than bare infinitives." In the sense in which this observation is de by the author, the very reverse of it seems to be the truth. The infinitives, as thus used, acquire, at least in the mind of the der, something like the power of affirmation, which they certainly have not when standing by themselves; whereas the subjunc- es neither lose nor acquire any meaning by being placed after *quod*. *Dico, credo, puto, Titium existere, valere, jacere*, &c. when trans- ed literally, signify, *I say, believe, think, Titius to exist, to be well, to lie along*; a mode of speaking which, though now not elegant, s common with the best writers in the days of Shakspeare, and is frequently to be found in the writings of Warburton at a much er period. *Dico, credo, puto, quod Titius existat, quod jaceat*, &c. signifies literally, *I say, believe, think, that Titius may exist, may lie along*, &. Remove the verbs in the indicative mode from the former set of phrases, and it will be found that the infinitives had acquired eaning, when conjoined with them, which they have not when left by themselves; for *Titium existere, jacere*, "Titius to exist, to along," have no complete meaning, because they affirm nothing. On the other hand, when the indicative verbs are removed, to- her with the wonder-working *quod*, from the latter set of phrases, the meaning of the subjunctives remains in all respects as it was ore the removal; for *Titius existat, jaceat*, &c. signify, *Titius may exist, may lie along*, as well when they stand by themselves as en they form the final clauses of a compound sentence. Every one knows that *quod*, though often called a conjunction, is always fact the relative pronoun. *Dico, credo, puto, quod Titius existat*, must therefore be construed thus: *Titius existat (est id) quod dico, do*, &c. "Titius may exist—is that thing, that proposition, which I say, believe, think." In the former set of phrases, the infi- ives are used as abstract nouns in the accusative case, denoting, in conjunction with *Titium*, one complex conception, the *existence, of Titius: Dico, credo, puto*, "I say, believe, think;" and the object of my speech, belief, thought, is *Titium existere*, "the existence Titus."

In confirmation of the same idea, that the infinitive is truly a *verb*, Dr Gregory quotes from Horace a passage, which, had we ought quotations necessary, we should have urged in support of our own opinion:

Nec quicquam tibi prodest
Aërias *tentasse* domos, animoque rotundum
Percurrisse polum, morituro.

our apprehension, nothing can be clearer than that *tentasse* and *percurrisse* are here used as nouns; for if they be not, where ll we find a nominative to the verb *prodest?* It was certainly what was signified by TENTASSE *aërias domos, animoque rotundum* RCURRISSE *polum*, that is said to have been no advantage to Archytas at his death. This, indeed, if there could be any doubt out it, would be made evident by the two prose versions which the professor subjoins to these beautiful lines. The first of them as follows: *Nec quicquam tibi prodest quod aërias domos* TENTAVERIS, *et animo* PERCURRERIS *polum*; which must be thus constructed: NTAVERIS *aërias domos, et* PERCURRERIS *animo polum (est id) quod nec quicquam tibi prodest*. This version, however, is not perfectly urate; for it contains two propositions, whereas Horace's lines contain but one. The second, which, though it may be a crabbed l inelegant sentence, expresses the poet's sense with more precision, is in these words: *Nec quicquam tibi prodest morituro tua* TEN- TIO *domuum aëriarum, et* CURSUS *tuus circa polum*. Having observed, with truth, that this sentence has the very same meaning h the lines of Horace, Dr Gregory asks, "why are not *tentatio* and *cursus* reckoned verbs as well as *tentasse* and *percurrisse?*" Let se answer this question who believe that any of these words are truly verbs; for they are surely, as he adds, all very near akin; eed so near, that the mind, when contemplating the import of each, cannot perceive the difference. Meanwhile, we beg leave in founding commands with the execution of commands. But the learned writer proceeds to informs us, that "it is from the connection of futurity with commands that the future of the indicative is sometimes used for the imperative mode." The connection of which he speaks appears to us entirely imaginary; for futurity has nothing to do with commands, though it may with the execution of them. The present time is the time of commanding, the future of obeying. But supposing the connection real, it would not account for the future tenses being used imperatively. For although it were true, as it is evidently false, that commands are future, it would not follow that the relation is convertible, or that employing the future should imply a command. The principle upon which such expressions as, *Thou shalt not kill*, come to have the force of a command, seems to be this: When a person, especially one possessed of authority, asserts that an action depending on the will of a free agent, and therefore in its own nature contingent, shall or shall not actually take place; what are we to conclude from such an assertion? Why, surely it is natural to conclude that it is his will, his command, that his assertion be verified. The English word *shall*, if we be well informed, denoted originally obligation; a sense in which its past tense *should* is still commonly employed. In English, therefore, the foregoing process of inferring a command from an assertion of futurity seems to have been reversed; and the word *shall*, from denoting a command or obligation, has come to denote futurity simply.

Having considered the verb in its essence, its tenses, and its modes, we might seem to have exhausted the subject; but there is still something more to be done. Grammarians have distinguished verbs into several species; and it remains with us to inquire upon what principle in nature this distinction is made, and how far it proceeds. Now it must be obvious, that if predication be the essence of verbs, all verbs as such must be of the same species; for predication is the same in every proposition, under every possible circumstance, and by whomsoever it is made. But the greater part of verbs contain the predicate as well as the predication of a proposition; or, to speak in common language, they denote an attribute as well as an affirmation. Thus, *lego* is "I am *reading*," *ambulo*, "I am *walking*," *sto*, "I am *standing*," *verbero*, "I am *striking*," *verberor*, "I am *stricken*." But the attributes expressed by these verbs are evidently of different kinds; some consisting in action, some in suffering, and some in a state of being which is neither active nor passive. Hence the distinction of verbs, according to the attributes which they denote, into *active*, *passive*, and *neuter*. *Lego*, which is an assertion that I am employed in the act of reading, is an active verb; *verberor*, which is an assertion that I am suffering under the rod, is a passive verb, because it denotes a passion; and *sto*, which is an assertion that I am standing still, is said to be a neuter verb, because it denotes neither action nor passion. But it is self-evident that there cannot be action without an agent, nor passion without a passive being; neither can we make a predication of any kind, though it denote neither action nor passion, without predicating of something. All verbs, therefore, whether active, passive, or neuter, have a necessary reference to some noun expressive of the substance of which the attribute denoted by the verb is predicated. This noun, which in all languages must be in the nominative case, is said to be the nominative of the verb; and in those languages in which the verb has person and number, it must in these respects agree with its nominative.

Of action, and consequently of verbs denoting action, there are obviously two kinds. There is an action which passes from the agent to some subject upon which he is employed, and there is an action which respects no object beyond the agent himself. Thus *lego* and *ambulo* are verbs which equally denote action; but the action of *lego* refers to some external object as well as to the agent; for when a man is reading, he must be reading something, a book, a newspaper, or a letter, whereas the action of *ambulo* is confined wholly to the agent; for when a man is walking he is employed upon nothing beyond himself, his action produces no effect upon any thing external. These two species of verbs have been denominated transitive and intransitive; a designation extremely proper, as the distinction which gave rise to it is philosophically just. Verbs of both species are active; but the action of those only which are called transitive respects an external object; and therefore in those languages of which the nouns have cases, it is only after verbs which are transitive as well as active, that the noun denoting the subject of the action is put in the accusative or objective case. Verbs which are intransitive, though they be really active, are in the structure of sentences considered as neuter, and govern no case.

So much, then, for that most important of all words, the verb. We proceed now to the consideration of participles, adjectives, and adverbs, which, as they have a near relation to one another, we shall treat of under one head or division.

V.—*Of Participles, Adjectives, and Adverbs.*

1. *Of Participles.*

The nature of verbs being understood, that of *participles* is not of difficult comprehension. Every verb, except that which is called the substantive verb, is expressive of an attribute, of time, and of an assertion. Now if we take away the assertion, and thus destroy the verb, there will remain the attribute and the time; and these combined make the essence of that species of words called *participles*. Thus, take away the assertion from the verb γραφει, *writeth*, and there remains the participle γραφων, *writing*, which, without the assertion, denotes the same attribute and the same time. In the same manner, by withdrawing the assertion, we discover γραψας, *written*, in εγραψε, *wrote*; γραψων, *about to write*, in γραψει, *shall be writing*. This is the doctrine of Mr Harris respecting participles; and, in our opinion, it is equally elegant, perspicuous, and just. But as it has been controverted by an author of some note in the republic of letters, we should perhaps be wanting in duty to our readers were we to pass his objections wholly unnoticed.

It is acknowledged by Dr Beattie, the writer to whom we allude, that the view which we have taken is the most convenient in which the participle can be considered in universal grammar; but he affirms that present participles do not always express present time, nor preterite participles past time; nay, that participles have often no connection with time at all. He thus exemplifies his assertion in Greek, in Latin, and in English:

"When Cebes says, Ετυγχανομεν περιπατουντες ἐν τῳ του Χρονου ἱερῳ, 'We *were walking* in the temple of Saturn,' the participle of the present *walking* is, by means of the verb

---

our turn to ask, Why are not *tentasse* and *percurrisse* reckoned abstract nouns as well as *tentatio* and *cursus*? To this question it is not easy to conceive what answer can be returned upon the doctor's principles. In his theory there is nothing satisfactory; and what has not been done by himself, we need scarcely expect from any of his followers. On the other hand, our principles furnish a very obvious reason for excluding *tentatio* and *cursus* from the class of verbs; it is, because these words express no predication. *Tentasse* and *percurrisse* indeed denote predication no more than *tentatio* and *cursus*; and therefore upon the same principle we exclude them likewise from a class to which, if words are to be arranged according to their import, they certainly do not belong.

ere, applied to time past, and therefore of itself cannot be nderstood to signify any sort of time." Again, after ob- rving, that in English we have but two simple participles, ch as *writing* and *written*, of which the former is gene- lly considered as the present and the latter as the past, e doctor adds, but " the participle *writing*, joined to a rb of different tenses, may denote either past or future tion; for we may say not only, *I* AM *writing*, but also, *I* AS *writing* yesterday, and *I* SHALL BE *writing* to-morrow;" d hence he infers that *no time whatever* is denoted by e present participle. But this is obviously a hasty infe- nce, drawn from the doctrine of absolute time and a defi- te present, which we have already shown to be ground- ss and contradictory. When we speak simply of an action present, we must mean that it is present with respect to mething besides itself, or we speak a jargon which is un- telligible; but we do not ascertain the time of its pre- nce. From the very nature of time, an action may be esent now, it may have been present formerly, or it may present at some future period; but the precise time of presence cannot be ascertained even by the present of e indicative of the verb itself; yet who ever supposed at the present of the indicative denotes no time? The rticiple of the present represents the action of the verb going on; but an action cannot be going on without ing present in time with something. When, therefore, ebes says, " We were walking in the temple of Saturn," represents the action of the verb walking as present with mething; but by using the verb expressive of his asser- on in a past tense, he gives us to understand that the ac- on was not present with any thing at the period of his eaking, but at some portion of time prior to that period; d what that portion of time was, must be collected from e subsequent parts of his discourse. The same thing may so be said of the phrases *I was writing yesterday*, and *I all be writing to-morrow*. They indicate that the action the verb *write* was present with me yesterday, and will ain be present with me to-morrow. The action and the ne of action are denoted by the participle; that action affirmed to belong to me by means of the verb; and the ne at which it belonged to me is pointed out by the nses of that verb, *am*, *was*, and *shall be*. All this is so ain, that it could not have escaped Dr Beattie's penetra- on, if he had not hastily adopted the absurd and contra- ctory notion of a definite present.

Of the truth of his assertion respecting past participles gives a Greek and a Latin example. The former is ken from St Mark, viz. ὁ πιστευσας σωθησεται; and the lat- r is that which is commonly called the perfect future of e passive verb *amor, amatus fuero*. In the first instance, says that the participle, though belonging to the aorist the past time, must be rendered either by the indefinite esent, " he *believeth*;" or by the *future*, " he who *ll* believe;" and the reason which he gives for this ren- ring of the word is, that " the believing here spoken of considered as posterior in time to the enunciation of the omise." This is indeed true, but it is not to the purpose; with the enunciation of the promise the time of the rticiple has no manner of concern. The time of πιστευσας pends entirely upon the time of σωθησεται, with respect which it must undeniably be past. Our Lord is not re asserting, that he who shall believe at the day of final tribution shall be saved, but that he who shall on that y be found to *have believed* in time past shall be saved; d if the participle had not been expressive of a finished tion and a past time, the whole sentence would have con- yed a meaning not friendly to the interests of the gospel. like manner, the time of *amatus* is referred, not to the ne of speaking, but to the time of *fuero*, with respect to ich, who sees not that it is past? The two words, taken gether, contain a declaration, that he who utters them shall, at some time posterior to that of speaking, *have* BEEN *loved*; the expression *shall have been loved* denotes two times, both future with respect to the time of speaking; but when the time denoted by *shall have* comes to be present, that of the participle *loved* must be *past*, for it is declared that the action of it shall *then* be complete and finished.

Adjectives.

We conclude, then, that it is essential to a participle to express both an attribute and time; and that such words as denote no time, though they may be in the *form* of participles, as *doctus*, " learned," *eloquens*, " eloquent," &c. belong to another part of speech, which we now proceed to consider.

2. *Of Adjectives.*

The nature of verbs and participles being understood, that of *adjectives* becomes easy. A verb implies, as we have said, an attribute, time, and an assertion; a participle implies only an attribute and time; and an *adjective* implies only an attribute as belonging to some substance. In other words, an *adjective* has no assertion, and it denotes only such an attribute as has not its essence either in motion or its privation. Thus, in general, the attributes of quantity, quality, and relation, such as *many, few, great, little, black, white, good, bad, double, treble*, and the like, are all denoted by *adjectives*.

To understand the import and the use of this species of words, it must be observed that every adjective is resolvable into a substantive and an expression of connection equivalent to *of*. Thus, a *good man* is a *man of goodness;* where we see the attribute denoted by the adjective fully expressed by an abstract noun. But it is evident that the noun *goodness* does not express the *whole meaning* of the adjective *good;* for every adjective expresses not only an attribute, but also the connection between the attribute and its substance; whereas in the abstract noun, the attribute is considered as a substance unconnected with any other substance.

In the next place, it is to be observed, that the connection expressed by adjectives, like that expressed by *of*, is of a nature so general and indefinite, that the particular kind of connection must, in some languages, be inferred from our previous knowledge of the objects between which it subsists, or it will for ever remain unknown. This might be proved by a variety of examples, but will perhaps be sufficiently evident from the following: *Color salubris* signifies colour that *indicates* health; *exercitatio salubris*, exercise that *preserves* health; *victus salubris*, food that *improves* health; *medicina salubris*, medicine that *restores* health. In all these examples the connection expressed by the adjective form of *salubris* is different; and though it may be known from previous experience, there is nothing in any of the expressions themselves by which it can be ascertained. Thus, adjectives are each significant of an attribute and connection; but the particular kind of connection is ascertained by experience. The usual effect of adjectives in language, is to modify or particularize a general term, by adding some quality or circumstance which may distinguish the object meant by that term, from the other objects of the same species. I have occasion, for example, to speak of a particular man, of whose name I am ignorant. The word *man* is too general for my purpose, it being applicable to every individual of the human species. In what way then do I proceed, in order to particularize it, so as to make it denote that very man whom I mean to specify? I annex or conjoin to it such words as are significant of objects and qualities with which he is connected, and which are not equally applicable to others from whom I mean to distinguish him. Thus I can say, *a man of prudence* or a *prudent man*, a *wise man*, a *good man*, a *brave man*, and so on. By means of these additions the general term *man* is limited or modified, and can be applied only to certain men to whom belong the attributes expressed by the adjectives *prudent*, *wise*, *good*, and *brave*. If it be still too general for my purpose, I can add to it other qualities and circumstances, till I make it so particular as to be applicable to but one individual man in the universe.

This is the way in which adjectives are commonly used, but this is not the only way. Instead of being employed to modify a substantive, they sometimes appear as the principal words in the sentence, when the sole use of the substantive seems to be to modify the abstract noun, contained under the adjective to which that substantive is joined. In order to understand this, it will be necessary to attend to the following observations.

It may be laid down as a general proposition, that when any term or any phrase is employed to denote a complex conception, the mind has a power of considering, in what order it pleases, the simple ideas of which the complex conception is composed. To illustrate this observation by an example: The word *eques* in Latin denotes a complex conception, of which the constituent simple ideas are those of a man and a horse; with this connection subsisting between them, that the man is conceived as on the back of the horse. In the use of this word, it is well known that the idea first in order, as being the principal subject of the proposition, is commonly the *man* on the back of the horse; but it is not always so, for the mind may consider the *horse* as the principal object. Thus, when Virgil says,

> Fræna Pelethronii Lapithæ gyrosque dedere,
> Impositi dorso; atque *equitem* docuere sub armis
> *Insultare solo*, et *gressus glomerare superbos*—

the energies attributed to the object signified by *equitem* make it evident that the horse, and not the man, is meant; for it is not the property of a man, *insultare solo, et gressus glomerare superbos*.

The same observation holds true where the *complex object* is denoted by two or more words; an adjective, for instance, and a substantive. Thus in the phrase *summus mons se inter nubila condit*, the words *summus mons* represent a complex conception, of which the constituent ideas are those of *height* and *mountain*, connected together by the adjective form of *summus*. Either of these ideas may be the subject of the proposition; and the expression will accordingly admit of two different significations. If *mons* be made the subject of the proposition, the meaning will be, "the highest mountain hides itself amongst the clouds." If the substantive included in the radical part of *summus* be made the subject of the proposition, the expression will signify, "the summit, or highest part, of the mountain, hides itself amongst the clouds." The latter is the true import of the sentence.

From these observations and examples, we shall be enabled to understand the two uses of the adjective. It is either employed, as has been already observed, to restrict or modify a general term; or the abstract substantive contained in the adjective is modified by the noun, with which, in the concrete or adjective form, that abstract substantive is joined. The first may be called the *direct*, the second the *inverse*, acceptation of adjectives.

The inverse acceptation of adjectives and participles, for both are used in the same manner, has scarcely been noticed by any grammarian excepting Dr Hunter of St Andrews; yet the principle is of great extent in language. In order to explain it, we shall produce a few examples, which on any other principle it is impossible to understand. Livy, speaking of the abolition of the regal authority at Rome, says, *Regnatum est Romæ ab* URBE CONDITA *ad* LIBERATAM *annos ducentos quadraginta quatuor*, "Monarchy subsisted at Rome (*not* from the *city built*, which would convey no meaning, but) from the *building of the city* to its *deliverance*." Both the participles *condita* and *liberatam* are here used inversely; that is, the abstract substantives contained in *condita* and *liberatam* are modified or restricted by the substantives *urbe* and *urbem*, with which they unite. Again, Ovid, speaking of the contest between Ajax and Ulysses for the arms of Achilles, has these lines:

> Qui, licet eloquio fidum quoque Nestora vincat,
> Haud tamen efficiet, *desertum* ut *Nestora crimen*
> Nullum esse rear.———

Here also the adjective or participle *desertum* is taken inversely, and the general notion of *desertion* contained in it is modified or rendered particular by being joined with the substantive *Nestora*. The meaning of the passage is, "I will never be induced to believe that the *desertion of Nestor* was not a crime." Were *desertum* to be taken directly as an adjective modifying its substantive, the sentence must be translated, "I cannot believe that *Nestor deserted* was not a crime." But it is evident that this is nonsense; as *Nestor*, whether deserted or not deserted, could not be a crime.

It were easy to produce many more examples of adjectives taken inversely; but these may suffice to illustrate the general principle, and to show, that without attending to it, it is impossible to understand the ancient authors. We shall produce one instance of it from Shakspeare, to evince that it is not confined to the ancient languages, though in these it is certainly more frequent than in the modern:

> Freeze, freeze, thou bitter sky,
> Thou canst not bite so nigh
> As *benefits forgot;*
> Though thou the waters warp,
> Thy sting is not so sharp
> As *friends remember'd not.*

Here it is evident that the adjective *forgot* is taken inversely; for it is not a benefit, but the *forgetting* of a benefit, which bites more than the bitter sky; and therefore, in this passage, the adjective serves not to modify the noun, but the noun *benefits* is employed to modify the abstract substantive contained in the adjective *forgot*, which is the subject of the proposition, and the principal word in the sentence.

Had Mr Harris attended to this principle, and reflected upon what he could not but know, that all adjectives denote substances; not indeed subsisting by themselves, as those expressed by nouns, but concretely, as the attributes of other substances; he would not have classed adjectives with verbs, or have passed so severe a censure upon the grammarians for classing them with nouns. It matters very little how adjectives are classed, provided their nature and effect be understood; but they have at least as good a title to be ranked with nouns as with verbs, and in our opinion a better. To adopt Mr Harris's language, they are homogeneous with respect to nouns, as both denote substances; they are heterogeneous with respect to verbs, as they never do denote assertion.

Besides original adjectives, there is another class, which is formed from substantives. Thus, when we say, *the party of Pompey*, *the style of Cicero*, *the philosophy of Socrates*; in these cases the *party*, the *style*, and the *philosophy* spoken of, receive a stamp and character from the persons whom they respect; and those persons, therefore, perform the part of attributes. Hence they actually pass into attributives, and assume as such the form of adjectives. It is thus we say, the *Pompeian party*, the *Ciceronian style*, and the *Socratic philosophy*. In like manner, for a trumpet *of brass*, we say a *brazen* trumpet, and for a crown *of gold*, a *golden* crown, &c. Even pronominal substantives admit a similar mutation. Thus, instead of saying the book *of me*, and *of thee*, we say *my* book, and *thy* book;

Adverbs, &c.

nd instead of saying the country *of us* and *of you*, we y *our* country and *your* country. These words, *my*, y, *our*, *your*, &c. have therefore been properly called ronominal adjectives.

It has been already observed, and must be obvious to l, that substances alone are susceptible of sex; and that herefore substantive nouns alone should have distinctons respecting gender. The same is true with respect o number and person. An *attribute* admits of no change its nature, whether it belong to *you* or to *me*, to a *man* a *woman*, to *one man* or to *many*; and therefore the ords expressive of attributes ought on all occasions, and every situation, to be fixed and invariable. For as the ualities *good* and *bad*, *black* and *white*, are the same, whether they be applied to a man or a woman, to many or to w; so the word which expresses any one of these attriutes ought in strictness to admit of no alteration, with hatever substantive it may be joined. Such is the orer of nature, and that order, on this as on other occaons, the English language most strictly observes; for e say equally, *a good man* or *a good woman*; *good men* *good women*; *a good house* or *good houses*. In some nguages, indeed, such as Greek and Latin, of which the ouns admit of cases, and the sentences of an inverted ructure, it has been found necessary to endow adjectives th the threefold distinction of gender, number, and rson; but as this is only an accidental variation, occaoned by particular circumstances, and not in the least ssential to language, it belongs not to our subject, but to e particular grammars of these tongues.

There is, however, one variation of the adjective, which s place in all languages, is founded in the nature of ings, and properly belongs to universal grammar. It is casioned by comparing the attribute of one substance th a similar attribute of another, and falls naturally to explained under the next section.

3. *Of Adverbs, and the Comparison of Adjectives.*

As adjectives denote the attributes of substances, so ere is an inferior class of words which denote the mofications of these attributes. Thus, when we say, "Cicero and Pliny were both of them *eloquent;* Statius d Virgil both of them *wrote*;" the attributes expressed the words *eloquent* and *wrote* are immediately referred Cicero, Virgil, &c.; and as denoting the attributes of bstances, these words, the one an adjective, and the her a verb, have been both called *attributives of the first der*. But when we say, "Pliny was *moderately* eloent, but Cicero *exceedingly* eloquent; Statius wrote *infferently*, but Virgil wrote *admirably;*" the words *morately*, *exceedingly*, *indifferently*, and *admirably*, are not ferrible to substantives, but to other attributes; that is, the words *eloquent* and *wrote*, the signification of which ey modify. Such words, therefore, having the same efct upon adjectives that adjectives have upon substanves, have been called *attributives of the second order*. grammarians they have been called *adverbs;* and if we ke the word *verb* in its most comprehensive signification,[1] including not only verbs properly so called, but also ery species of words which, whether essentially or accintally, are significant of the attributes of substances, we all find the name *adverb* to be a very just appellation, as noting *a part of speech, the natural appendage of such rbs*. So great is this dependence in grammatical syntax, at an adverb can no more subsist without its verb, that is, without some word significant of an attribute, than a verb or adjective can subsist without its substantive. It is the same here as in certain natural subjects. Every colour, for its existence, as much requires a superficies, as the superficies for its existence requires a solid body.

Amongst the attributes of substance are reckoned quantity and quality; thus we say a *white garment*, a *high mountain*, and the like. Now some of these quantities and qualities are capable of intension or remission; or, in other words, one substance may have them in a greater or less degree than another. Thus we say, *a garment* EXCEEDINGLY *white*, *a mountain* TOLERABLY OR MODERATELY *high.* Hence, then, one copious source of secondary attributes or *adverbs* to denote these two, that is, intension and remission; such as *greatly*, *tolerably*, *vastly*, *extremely*, *indifferently*.

But where there are different intensions of the same attribute, they may be compared together. Thus, if the garment A be EXCEEDINGLY *white*, and the garment B be MODERATELY *white*, we may say, the garment A is MORE *white* than the garment B. This paper is *white*, and snow is *white*; but snow is MORE *white* than this paper. In these instances the adverb *more* not only denotes intension, but relative intension; nay, we stop not here, as we not only denote intension merely relative, but relative intension than which there is none greater. Thus we say, Sophocles was *wise*, Socrates was MORE *wise* than he, but *Solomon* was the MOST *wise* of men. Even verbs, properly so called, which denote an attribute as well as an assertion, must admit both of simple and of comparative intensions; but the simple verb *to be* admits of neither the one nor the other. Thus, in the following example, *Fame he* LOVETH MORE *than riches, but virtue of all things he* LOVETH MOST; the words *more* and *most* denote the different comparative intensions of the attribute included under the verb *loveth;* but the assertion itself, which is the essential part of the verb, admits neither of intension nor remission, and is the same in all possible propositions.

From this circumstance of quantities and qualities being capable of intension and remission, arise the *comparison* of adjectives, and its different *degrees*, which cannot well be more than the two species above mentioned; one to denote simple excess, and one to denote superlative. Were we indeed to introduce more degrees than these, we ought perhaps to introduce an infinite number, which is absurd. For why stop at a limited number, when in all subjects susceptible of intension, the intermediate excesses are in a manner infinite? Between the first simple *white* and the superlative *whitest* there are infinite degrees of *more white*; and the same may be said of *more* great, *more* strong, *more* minute, and so on. The doctrine of grammarians about *three* such degrees of comparison, which they call the *positive*, the *comparative*, and the *superlative*, must be absurd; both because in their positive there is no comparison at all, and because their superlative is a comparative as much as their comparative itself. Examples to evince this may be met with everywhere. *Socrates was the* MOST WISE *of all the Athenians*; *Homer was the* MOST SUBLIME *of all poets.* In this sentence Socrates is evidently compared with the Athenians, and Homer with all other poets. Again, if it be said that *Socrates was* MORE WISE *than any other Athenian, but that Solomon was the* MOST WISE *of men*, is not a comparison of Solomon with mankind in general, as plainly implied in the last clause of the sentence, as a comparison of Socrates with the other Athenians in the first?

---

[1] Aristotle and his followers called every word a verb which denotes the predicate of a proposition. This classification was certnly absurd; for it confounds not only adjectives and participles, but even substantives, with *verbs;* but the authority of Aristotle as great; and hence the name of adverb, though that word attaches itself only to an adjective or participle, or a verb significant of attribute, and does not attach itself to the pure verb.

But if both imply comparison, it may be asked, in what consists the difference between the comparative and superlative? Does the superlative always express a greater excess than the comparative? It does not; for though Socrates was the *most* wise of the Athenians, yet is Solomon affirmed to have been *more* wise than he; so that here a higher superiority is denoted by the comparative *more* than by the superlative *most.* Is this then the difference between these two degrees, that the superlative implies a comparison of *one with many,* whilst the *comparative* implies only a comparison of *one with one?* No, this is not always the case neither. The Psalmist says, that "he is *wiser* (or *more wise*) than all his teachers;" where, though the comparative is used, there is a comparison of one with many.

The real difference between these two degrees of comparison may be explained thus:—When we use the superlative, it is in consequence of having compared individuals with the species to which they belong, or one or more species with the genus under which they are comprehended. Thus *Socrates was the* MOST WISE *of the Athenians, and the Athenians were the* MOST ENLIGHTENED *of ancient nations.* In the first clause of this sentence, Socrates, although compared with the Athenians, is at the same time considered as one of them; and in the last the Athenians, although compared with ancient nations, are yet considered as one of those nations. Hence it is that in English the superlative is followed by the preposition *of,* and in Greek and Latin by the genitive case of the plural number; to show that the object which has the pre-eminence is considered as belonging to that class of things with which it is compared. But when we use the comparative degree, the objects compared are set in direct opposition; and the one is considered not as a part of the other, or as comprehended under it, but as something altogether distinct and belonging to a different class. Thus, were any one to say, "Cicero was *more eloquent* than the Romans," he would speak absurdly; because every body knows, that of the class of men expressed by the word *Romans,* Cicero was one, and such a sentence would affirm that orator to have been more eloquent than himself. But when it is said that "Cicero was *more eloquent* than all the *other* Romans, or than *any other* Roman," the language is proper, and the affirmation true; for though the persons spoken of were all of the same class or city, yet Cicero is here set in contradistinction to the rest of his countrymen, and is not considered as one of the persons with whom he is compared. It is for this reason that in English the comparative degree is followed by a noun governed by the word of contradistinction *than,* and in Latin by a noun in the ablative case governed by the preposition *præ*[1] either expressed or understood. We have already observed, that the ablative case denotes concomitancy; and therefore when an adjective in the comparative degree is prefixed to a noun, that noun is put in the ablative case, to denote that two things are compared together in company; but by means of the preposition, expressed or understood, that which is denoted by the comparative adjective is seen to be preferred before that which is denoted by the noun.

We have hitherto considered the comparative as expressed by the words *more* and *most;* but the authors or improvers of language have contrived a method of retrenching the use of these adverbs, by expressing their force by an inflexion of the adjective. Thus, instead of *more fair,* they say *fairer;* instead of *most fair, fairest;* and the same method of comparison takes place both in the Greek and Latin languages; with this difference, however, between the genius of these languages and ours, that we are at liberty to form the comparison either in the one method or in the other; whereas in those languages the comparison is seldom or never formed by the assistance of the adverb, but always by the inflexion of the adjective. Hence this inflexion is by the Greek and Latin grammarians considered as a necessary accident of the adjective; but it has reached no further than to adjectives, and participles sharing the nature of adjectives. The attributes expressed by verbs are as susceptible of comparison as those expressed by adjectives; but they are always compared by means of adverbs, the verb being too much diversified already to admit of more variations without perplexity.

It must be confessed, that comparatives, as well the simple as the superlative, seem sometimes to part with their relative nature, and to retain only their intensive. Thus in the degree denoting simple excess,

> *Tristior,* et lacrymis oculos suffusa nitentes.—*Virg.*

Tristior means nothing more than that Venus was very sad. In the degree called the superlative this is more usual. Phrases extremely common are, *Vir doctissimus, vir fortissimus,* "a most learned man, a most brave man;" that is, not the bravest and most learned man that ever existed, but a man possessing those qualities in an eminent degree. In English, when we intimate that a certain quality is possessed in an eminent degree, without making any direct comparison between it and a similar quality, we do it by the intensive word *very,* more commonly than by *most;* as, Cicero was *very* eloquent, the mind of Johnson was *very* vigorous. This mode of expression has been called the superlative of eminence, to distinguish it from the other superlative, which is superlative upon comparison. Yet it may be said, that even in the superlative of eminence something of comparison must be remotely or indirectly intimated, as we cannot reasonably call a man *very* eloquent, without comparing his eloquence with the eloquence of other men. This is indeed true; but we cannot therefore affirm that comparison is more clearly intimated in this superlative than in the simple adjective *eloquent;* for when we say that a man is eloquent, we mark between his eloquence and that of other men a distinction of the same kind, though not in the same degree, as when we say that he is very eloquent.

In English we distinguish the two superlatives, by prefixing to the one the definite article *the,* to show that something is predicated of the object expressed by it, which cannot be predicated of any other object; and by subjoining the preposition *of,* to show that the objects with which it is compared are of the same class with itself; as, "Solomon was *the* wisest *of* men; Hector was *the* most valiant *of* the Trojans." To the other superlative[2] we only prefix

---

[1] See Ruddiman, *Grammaticæ Institutiones,* pars secunda, lib. i. cap. 2. Although it is certainly true, that when we use the superlative, we ought in propriety to consider the things compared as of the same class; and when we use the comparative, as of different classes; yet this distinction is not always attended to by the best writers in any language. In Latin and Greek the comparative is sometimes used, where in English we should use the superlative; as *dextra est fortior manuum;* and in the Gospel it is said, that "a grain of mustard-seed is the *smaller* (μικροτερος) of all seeds, but when grown up it is the *greater* (μειζων) of herbs." Even in English, the custom of the language permits us not to say, "he is the *tallest* of the two," it must be the *taller* of the two; but we cannot say "he is the *taller* of the *three,*" it must be the *tallest.* For these and other deviations from the general rule no reason is to be found in the nature of things; they are errors made proper by use.

[2] In English, the termination *est* is peculiar to the superlative of comparison, to which the definite article is prefixed. Thus we may say, "Homer was the *sublimest* of poets;" but we cannot say, "Homer was a sublimest poet." Again, we may say, "Homer was *a very* sublime poet;" but not, "Homer was *the very* sublime poet."

Adverbs, &c.

the indefinite article *a;* as, "he was *a very* good man; he was *a most* valiant soldier."

As there are some qualities which admit of comparison, so there are others which admit of none; such, for example, are those which denote that quality of bodies arising from their figure, as when we say, a *circular* table, a *quadrangular* court, a *conical* piece of metal, and the like. The reason is, that a million of things participating the same figure, participate it equally, if they do it at all. To say, therefore, that whilst A and B are both quadrangular, A is *more* or *less* quadrangular than B, is absurd. The same holds true in all attributives denoting definite quantities of whatsoever nature; for as there can be no comparison without intension or remission, and as there can be no intension or remission in things always definite, therefore these attributives can admit of no comparison. By the same method of reasoning, we discover the cause why no substantive is susceptible of these degrees of comparison. A mountain cannot be said *more to be* or *to exist* than a mole-hill; but the *more* or *less* must be sought for in their quantities. In like manner, when we refer many individuals to one species, the lion A cannot be called *more* a lion than the lion B; but if more any thing, he is *more* fierce, *more* swift, or exceeding in some such attribute. So, again, in referring many species to one genus, a crocodile is not *more* an animal than a lizard; nor a tiger more than a cat; but, if any thing, the crocodile and tiger are *more* bulky, *more* strong, &c. than the animals with which they are compared; the excess, as before, being derived from their attributes.

Of the adverbs or secondary attributives already mentioned, those denoting intension and remission may be called *adverbs of quantity continuous*, as *greatly*, *vastly*, *tolerably*, &c. *once*, *twice*, *thrice*, &c.[2] are *adverbs of quantity discrete*, as *more* and *most*, *less* and *least*, to which may be added *equally*, *proportionally*, &c. are *adverbs of relation*. There are others of *quality;* as when we say, *honestly* industrious, *prudently* brave; they fought *bravely*, he painted *finely*.

And here it may be worth while to observe, how the same thing, participating the same essence, assumes different grammatical forms from its different relations. For example, suppose it should be asked, How differ *honest*, *honestly*, and *honesty?* The answer is, they are in essence the same; but they differ in as much as *honest* is the attribute of a noun; *honestly*, of a verb or adjective; and *honesty* being divested of these its attributive relations, assumes the power of a noun or substantive, so as to stand by itself.

The adverbs hitherto mentioned are common to verbs of every species; but there are some which are confined to verbs properly so called, that is, to such verbs as denote motions or energies with their privations. All motion and rest imply time and place as a kind of necessary coincidence. Hence, when we would express the place or time of either, we have recourse to adverbs formed for this purpose; of *place*, as when we say, he stood *there*, he went *hence*, he came *hither;* of time, as when we say, he stood *then*, he went *afterwards*, he travelled *formerly*. To these may be added the adverbs which denote the intensions and remissions peculiar to *motion*, such as *speedily*, *hastily*, *swiftly*, *slowly*, &c.; as also adverbs of place made out of prepositions, such as *upwards* and *downwards*, from *up* and *down*. It may, however, be doubted whether some of these words, as well as many others, which do not so properly modify attributes, as mark some remote circumstance attending an attribute or our way of conceiving it, are truly adverbs, though so called by the grammarians. The simple affirmative and negative *yes* and *no* are called adverbs, though they surely do not signify that which we hold to be the very essence of the adverb, a modification of attributes. "Is he learned? No." "Is he brave? Yes." Here the two adverbs, as they are called, signify not any modification of the attributes *brave* and *learned*, but a total negation of the attribute in the one case, and in the other a declaration that the attribute belongs to the person spoken of.

Adverbs are indeed applied to many purposes; and their general nature may be better understood by reading a list of them, and attending to their etymology, than by any general description or definition. Many of them seem to have been introduced into language in order to express by one word the meaning of two or three, and are mere abbreviations of nouns, verbs, and adjectives. Thus, the import of the phrase, *in what place*, is expressed by the single word *where;* to what place, by *whither;* from this place, by *hence;* in a direction ascending, by *upwards;* at the present time, by *now;* at what time, by *when;* at that time, by *then;* many times, by *often;* not many times, by *seldom;* and so of others.

Mr Horne Tooke has, with great industry and accuracy, traced many of the English adverbs from their origin in the ancient Saxon and other northern tongues, and shown them to be either corruptions of other words or abbreviations of phrases and sentences. He observes, "that all adverbs ending in *ly*, the most prolific branch of the family, are sufficiently understood; the termination being only the word *like* corrupted, and the corruption so much the more easily and certainly discovered, as the termination remains more pure and distinguishable in the other sister languages, in which it is written *lick, lyh, lig, ligen*." He might have added, that in Scotland the word *like* is, at this day, frequently used instead of the English termination *ly;* as for a *goodly figure*, the common people say a *good-like* figure. Upon this principle the greater part of adverbs are resolved into those parts of speech which we have already considered, as *honestly* into *honest-like*, *vastly*, into *vast-like*, &c.; so that when we say of a man he is *honestly industrious*, we affirm that he is *honest-like industrious*, or that his industry has the appearance of being honest. Adverbs of a different termination the same acute writer resolves thus; *aghast* into the past participle *agazed;*

> The French exclaimed, the Devil was in arms.
> All the whole army stood *agazed* on him.—*Shaksp.*

Ago, into the past participle *agone* or *gone*. *Asunder* he derives from *asundered*, separated; the past participle of the Anglo-Saxon verb *asundrien*, a word which, in all its varieties, is to be found in all the northern tongues, and comes originally from *sond*, that is, sand. *To wit*, from *wittan*, to know; as *videlicet* and *scilicet*, in Latin, are abbreviations of *videre-licet* and *scire-licet*. *Needs*, he resolves into *need is*, used parenthetically; as, "I must *needs* do such a thing." "I must (need is) do such a thing;" that is, "I *must* do it, there *is need* of it." *Anon*, which our old authors use for *immediately*, *instantly*, means, he says, *in one*, that is, *in one instant*, *moment*, *minute*. As,

> And right *anon* withouten more abode.
> *Anon* in all the haste I can.

Alone and *only* are resolved into *all one*, and *one-like*. In the Dutch, *een* is one; and *all een* alone; and *all-een-like*, only, anciently *alonely*. *Alive* is on live, or in life. Thus, in Chaucer,

---

[1] When Pope says of a certain person, that he is "a tradesman, meek, and *much a liar*," the last phrase is the same with *much given* to lying, the word *liar* having the effect of an attributive.

[2] These words were anciently written *one's*, *twie's*, *thrie's*, and are merely the genitives of *one*, *two*, *three*, the substantive *time* or *turn* being omitted. Thus, *How often did you write?* Answer, *Once*, that is, *one's time*. (See Horne Tooke's *Diversions of Purley*).

Christ eterne *on live.*

Aught or *ought; a whit* or *o whit; o* being formerly written for the article *a*, or for the numeral *one;* and *whit* or *hwit*, in Saxon, signifying a small thing, as a *point* or *jot*. *Awhile*, which is usually classed with adverbs, is evidently a noun with the indefinite article prefixed; *a while*, that is, *a time*. *Whilst*, anciently and more properly *whiles*, is plainly the Saxon *hwilees, time that*. *Aloft* was formerly written *on-loft*. As, in Chaucer,

And ye, my mother, my soveregne pleasance
Over al thing, *out take* Christ *on lofte.*

Now, says Mr Horne Tooke, *lyft*, in the Anglo-Saxon, is the air or the clouds, as, *in lyfte cummende*, coming in the clouds (St Luke). In the Danish, *luft* is air; and "at spronge i *luften*," to blow up into the air, or *aloft*. So in the Dutch, *de loef hebben*, to sail before the wind; *loeven*, to ply to windward; *loef*, the weather gage, &c. From the same root are our other words, *Loft, lofty*, to *luff, lee, leeward, lift*, &c. It would be needless, as the ingenious author observes, to notice such adverbs as, *afoot, adays, ashore, astray, aslope, aright, abed, aback, abreast, afloat, aloud, aside, afield, aground, aland*, &c. These are at first view seen for what they are. Nor shall we follow him through the analysis which he has given of many other adverbs, of which the origin is not so obvious as of these. Of the truth of his principles we are satisfied; and have not a doubt, but that upon those principles a man conversant with our earliest writers, and thoroughly skilled in the present languages, may trace every English adverb[1] to its source, and show that it is no part of speech separate from those which we have already considered. The adverbs, however, of affirmation and negation, are of too much importance to be thus passed over; and as we have never seen an account of them at all satisfactory, except that which has been given by Mr Horne Tooke, we shall transcribe the substance of what he says concerning *aye, yea, yes*, and *no*. To us these words have always appeared improperly classed with adverbs, upon every definition which has been given of that part of speech. Accordingly, our author says, that *aye* or *yea* is the imperative of a verb of northern extraction; and means *have, possess, enjoy*. And *yes* is a contraction of *ay-es*, have, possess, enjoy, *that*. Thus, when it is asked whether a man be learned, if the answer be by the word *yes*, it is equivalent to *have that, enjoy that* belief or that proposition.

The northern verb of which *yea* is the imperative, is in Danish *ejer*, to possess, have, enjoy. *Eja*, aye or yea; *eje*, possession; *ejer*, possessor. In Swedish it is *ega*, to possess, of which the imperative is *ja*, aye, yea; *egare*, possessor. In German, *ja* signifies aye or yea; *eigener*, possessor, owner; *eigen*, own. In Dutch, *eigenen* is to possess; *ja*, yea. Greenwood derives *not* and its abbreviate *no* from the Latin; Minshow, from the Hebrew; and Junius, from the Greek. Our author very properly observes, that the inhabitants of the north could not wait for a word expressive of dissent till the establishment of those nations and languages; and adds, that we need not be inquisitive nor doubtful concerning the origin and signification of *not* and *no;* since we find that, in the Danish *nodig*, in the Swedish *nodig*, and in the Dutch, *noode, node*, and *no*, mean averse, unwilling. So that when it is asked whether a man be brave, if the answer be *no*, it is a declaration that he who makes it is averse from or unwilling to admit that proposition.

Most writers on grammar have mentioned a species of adverbs, which they call adverbs of interrogation, such as *where, whence, whither, how*, &c. But the truth is, that there is no part of speech which, of itself, denotes interrogation. A question is never asked otherwise than by abbreviation, by a single word, whether that word be a noun, a pronoun, a verb, or an adverb. The word *where* is equivalent to in what place; *whence*, to from what place; and *how*, to in what manner, &c. In these phrases, *in* what place, *from* what place, and *in* what manner, the only word that can be supposed to have the force of an interrogative, is *what*, which is resolvable into *that which*. But we have already explained, under the head of Pronouns, the principles upon which the relative is made to denote interrogation; and the same reasoning will account for the adverbs *where, whence, whither, how*, &c. being employed as interrogatives. When we say, "Where were you yesterday? whence have you come? whither are you going? how do you perform your journey?" we merely use so many abbreviations for the following sentences: "Tell us, or describe to us, *the place where* (or in which) you were yesterday; *the place whence* (or from which) you have come; *the place to which* you are going; *the manner in which* you perform your journey? And so much for adverbs. We now proceed to those parts of speech which are usually called prepositions and conjunctions, and of which the use is to connect the other words of a sentence, and to combine two or more simple sentences into one compound sentence.

VI.—*Of Prepositions, Conjunctions, and Interjections.*

It has been observed, that a man whilst awake is conscious of a continued train of perceptions and ideas passing in his mind, which depends little upon his own will; that he cannot to the train add a new idea; and that he can but very seldom break its connection. To the slightest reflection these truths must be apparent. Our first ideas are those which we derive from external objects making impressions on the senses; but all the external objects which fall under our observation are linked together in such a manner as indicates them to be parts of one great and regular system. When we take a view of the things by which we are surrounded, and which are the archetypes of our ideas, their inherent qualities are not more remarkable than the various relations by which they are connected. Cause and effect, contiguity in time or place, high and low, prior and posterior, resemblance and contrariety, with a thousand other relations, connect things together without end. There is not a single thing which appears solitary and altogether devoid of connection. The only difference is, that some are intimately and some slightly connected, some nearly and some at a distance. That the relations by which external objects are thus linked together must have great influence in directing the train of human thought, so that not one perception or idea can appear to the mind wholly unconnected with all other perceptions or ideas, will be admitted by every man who

---

[1] The same resolution might probably be made of the Greek and Latin adverbs, were we as intimately acquainted with the sources of those tongues as Mr Horne Tooke is with the sources of the English language. "Many of the Latin adverbs," says Ruddiman, "are nothing else but adjective nouns or pronouns, having the preposition and substantive understood; as *quo, eo, eodem*, for *ad quæ, ea, eadem (loca)* or *cui, ei, eidem (loco);* for of old these datives ended in *o*. Thus, *qua, hac, illac*, &c. are plainly adjectives in the ablative singular feminine, the word *via*, "a way," and the preposition *in*, being understood. Many of them are compounds; as, *quomodo*, i. e. *quo modo; quemadmodum*, i. e. *ad quem modum; quamobrem*, i. e. *ob quam rem; quare*, i. e. *(pro) qua re; quorsum*, i. e. *versus quem (locum); scilicet*, i. e. *scire licet; videlicet*, i. e. *videre licet; ilicet*, i. e. *ire licet; illico*, i. e. *in loco; magnopere*, i. e. *magno opere; nimirum*, i. e. *ni (est) mirum; hodie*, i. e. *hoc die; postridie*, i. e. *postero die; pridie*, i. e. *præ die*. *Perfecto, certe, sane, male, bene, plane*, are obviously adjectives. *Forte* is the ablative of *fors;* and if we had leisure to pursue the subject, and were masters of all the languages from which the Latin is derived, we doubt not but we should be able to resolve every adverb into a substantive or adjective.

Conjunctions.

lieves that his senses and intellect represent things as they are.

This being the case, it is necessary, if the purpose of language be to communicate thought, that the speaker be furnished with words, not only to express the ideas of substances and attributes which he may have in his mind, but also to indicate the order in which he views them, and to point out the various relations by which they are connected. In many instances all this may be done by the parts of speech which we have already considered. The closest connection which we can conceive, is that which subsists between a substance and its qualities; and in every language with which we are acquainted, that connection is indicated by the immediate coalescence of the adjective with the substantive; as we say, *a good man, a learned man; vir bonus, vir doctus.* Again, there is a connection equally intimate, though not so permanent, between an agent and his action; for the action is really an attribute of the agent; and therefore we say, the *boy reads*, the *man writes;* the noun coalescing with the verb so naturally, that no other word is requisite to unite them. Moreover, an action and that which is acted upon being contiguous in nature, and mutually affecting each other, the words which denote them should in language be mutually attractive, and capable of coalescing without external aid; as, he *reads a book*, he *builds a house*, he *breaks a stone.* Further, because an attribute and its modifications are inseparably united, an adjective or a verb is naturally connected with the adverb which illustrates or modifies its signification; and therefore, when we say, he *walks slowly*, he is *prudently brave*, it is plain that no other word is necessary to promote the coalescence of the attributes "walking" and "bravery" with their modifications of "slowness" and "prudence." The agreement between the terms of any proposition which constitutes truth is absolutely perfect; but as either of the terms may agree with many other things besides its correlate, some word is requisite in every proposition to connect the particular predicate with the particular subject; and that is the office of the simple verb *to be;* as, the three angles of every triangle *are* equal to two right angles.

Thus we see that many of the relations subsisting between our ideas may be clearly expressed by means of nouns, adjectives, verbs, and adverbs; and in those languages of which the nouns have cases, there is perhaps no relation of much importance which might not be thus pointed out, without being under the necessity of employing the aid of any additional part of speech. In English, however, the case is otherwise; for were we to say, "He rode Edinburgh, went the parliament-house, walked his counsel the court met," we should speak unintelligibly; as in these expressions there is either a total want of connection, or such a connection as produces falsehood and nonsense. In order to give meaning to the passage, the several gaps must be filled up by words significant of the various relations by which the different ideas are connected in the mind; as, "He rode *to* Edinburgh, went *to* the parliament-house, *and* walked *with* his counsel *till* the court met." Of these *connecting* words, *to* and *with* are called *prepositions*, *and* and *till* are usually called *conjunctions.* Although these prepositions and conjunctions are not so absolutely necessary in Greek and Latin as they are in English, yet as there is no language wholly without them, nor any language in which it is not of importance to understand their force, they well deserve a place in universal grammar.

The sole use of conjunctions and prepositions in language is to connect either sentences or other words; but the theory of these connectives themselves has certainly never been understood, unless Mr Horne Tooke has at last hit upon the truth. Mr Harris writes about them and about them, quoting passages from Greek and Latin authors, and produces at last no information. His definitions of both, as parts of speech void of signification, are highly absurd; and even the principal distinction which he makes between them seems not to be well founded. Prepositions and conjunctions denote the relations subsisting between the ideas expressed by those words or sentences which they serve to connect; and as relations are contemplated by the mind as well as positive ideas themselves, the words which denote these relations cannot be insignificant. The essential difference between the conjunction and preposition, according to the same author, consists in this, that the former connects sentences, and the latter words; but the fact is often otherwise. An obvious example occurs where the conjunction *and* connects not sentences but words. "A man of wisdom *and* virtue is a perfect character." Here it is not meant to be asserted, "that the man of *wisdom* is a perfect character, *and* that the man of *virtue* is a perfect character;" for both these assertions would be false. This sentence therefore (and many such will occur) is not resolvable into two; whence it follows, that the conjunction *and* does not always connect sentences; and the same is frequently the case with other conjunctions.

Mr Horne Tooke's idea of prepositions and conjunctions is, that they do not form distinct classes of words, but are merely abbreviations of nouns and verbs; and, with respect to the English language, he has been remarkably successful in proving his position. But though such be undeniably the case in English, it would be rash to conclude *a priori* that it is so in all other tongues. To establish this general conclusion would require a long and tedious deduction in each particular language; and how much language, leisure, industry, and acuteness, such an undertaking would require, even in one tongue, it is not easy to determine. In the languages with which we are best acquainted, many conjunctions, and most prepositions, have the appearance at least of original words; and though this most acute grammarian, from his knowledge of the northern tongues, has been able to trace the most important of those in English to very plausible sources, the same thing would be difficult in other languages of which the sources are obscure, and absolutely impossible in those of which they are wholly unknown. It is, however, a strong presumption in favour of his opinion, that grammarians have never been able to assign any general characteristic of those species of words, which, did they constitute distinct parts of speech, one would think could not have so long remained undiscovered. It is a further presumption in his favour, that many words in Greek and Latin, as well as in English, which have been called conjunctions, are obviously resolvable upon his principles, and indeed discover their meaning and origin upon mere inspection. We shall therefore content ourselves with retailing the common doctrine respecting these parts of speech so far as it is intelligible, subjoining at the bottom of the page the analysis given by Mr Horne Tooke, of the most important English conjunctions and prepositions; and requesting our readers, who would understand the subject, to attend more to the relations between their various ideas, than to the frivolous distinctions which, in compliance with custom, we are compelled to lay before them. We shall treat first of the *conjunction.*

1. *Of Conjunctions.*

A conjunction is a part of speech of which, as its name indicates, the use is to connect either two or more words in a sentence, or to make of two simple sentences one compound sentence. It is usually said that conjunctions never connect words, but sentences only, and that this is the circumstance which distinguishes them from *prepositions.* We

Conjunctions.

have already given one example which proves this distinction to be ill founded; we shall now give from Mr Horne Tooke one or two more, which will place its absurdity in a still clearer light: Two *and* two are four; John *and* Jane are a handsome couple; AB *and* BC *and* CA form a triangle. Are *two four?* Is *John* a *couple* and *Jane* a *couple?* Does *one straight line* form a *triangle?* It appears indeed that *and* may connect any two things which can be connected, as it signifies addition.[1]

Conjunctions connecting sentences sometimes connect their meaning, and sometimes not. For example, let us take these two sentences, "Rome was enslaved, Cæsar was ambitious," and connect them together by the conjunction *because;* "Rome was enslaved *because* Cæsar was ambitious." Here the meanings, as well as the sentences, appear to be connected by that natural relation which subsists between an effect and its cause; for the enslaving of Rome was the effect of Cæsar's ambition. That particular relation therefore is that which is denoted by the conjunction *because*,[2] which would be improperly used to connect two sentences between which the relation of an effect to its cause exists not. But if it be said, "manners must be reformed, *or* liberty will be lost;" here the conjunction *or*, though it joins the sentences, yet as to their meaning is a perfect disjunctive. Between the reformation of manners and the loss of liberty there is certainly a natural relation; but it is not the relation of contiguity or similitude, or of cause and effect, but of contrariety. The relation of contrariety therefore is the signification of the word *or*.[3] And thus it appears, that though all conjunctions may combine sentences, yet, with respect to the sense, some are *conjunctive* and others *disjunctive*.

Those conjunctions which conjoin both sentences and their meanings are either *copulatives* or *continuatives*. The principal copulative in English is *and*, which we have already considered. The continuatives are much more numerous; *if, an, because, therefore, wherefore, hence*, &c. The difference between them is this: The copulative does no more than barely couple words or sentences, and is therefore applicable to all subjects of which the natures are not incompatible.[4] The relation which it denotes is that of juxtaposition, or of one thing added to another. Continuatives, on the contrary, by a more intimate connection, consolidate sentences into one continuous whole; and are therefore applicable only to subjects which have an essential relation to each other, such as that of an effect to its cause, or of a cause to its effect. For example, it is no way improper to say, "Lysippus was a statuary, *and* Priscian a grammarian; the sun shineth, *and* the sky is clear;" because these are things that can co-exist, and yet imply no absurdity. But it would be absurd to say, "Lysippus was a statuary *because* Priscian was a grammarian;" though not to say, "the sun shineth *because* the sky is clear." With respect to the first, the reason is, that the word *because* denotes the relation which an effect bears to its cause; but the skill of Priscian in grammar could not possibly be the cause of Lysippus's skill in statuary; the coincidence between the skill of the one and that of the other, in arts so very different, was merely accidental. With respect to the shining of the sun and the clearness of the sky, the case is widely different; for the clearness of the sky is the *cause* of the sun's shining, at least so as to be seen by us.

As to the continuatives, they are either *suppositive*, such as *if, an;* or *positive*, such as *because, therefore, as*, &c. Take examples of each: "You will live happily *if* you live honestly; you live happily *because* you live honestly; you live honestly, *therefore* you live happily." The difference between these continuatives is this: The suppositives denote connection, but do not assert actual existence; the positives imply both the one and the other.[5]

---

[1] *And* is a Saxon word, being, according to Mr Horne Tooke, an abbreviation of ANAD, the imperative of the verb ANANAD, *to add to* or *heap up*. So that when we say *two* AND *two are four*, we only declare that *two* ADDED TO *two are four*.

[2] *Because* is compounded of the Saxon BE, *by*, and *cause;* and by some of our most ancient authors it was written BY CAUSE. "*Rome was enslaved* BECAUSE *Cæsar was ambitious*," is therefore equivalent to, "*Rome was enslaved by the cause* CÆSAR WAS AMBITIOUS;" taking the phrase, "Cæsar was ambitious," as an abstract noun in concord with the other noun cause.

[3] *Or* seems to be a mere contraction of the Saxon ODER, which signifies *other*, that is, something different and often contrary. So that the conjunction *or* must always denote diversity, and very often contrariety.

[4] As *day* and *night, heat* and *cold;* for we cannot say of the same portion of time, *it is day* AND *it is night;* or of the same body, it is both *hot* AND *cold*.

[5] The reason of all this will be apparent from the analysis given by Mr Horne Tooke of those words which we have called suppositive conjunctions. *If* and *an* may be used mutually and indifferently to supply each other's place; for they are both verbs, and of the same import. *If* is merely the imperative of the Gothic and Anglo-Saxon verb GIFAN, *to give;* and in those languages, as well as in the English formerly, this supposed conjunction was pronounced and written as the common imperative GIF. Thus,

> My largesse
> Hath lotted her to be your brother's mistresse,
> *Gif* shee can be reclaimed; *gif* not, his prey. *Sad Shepherd.*

Gawin Douglass almost always uses *gif* for *if*, as the common people in some counties of Scotland do even at this day; and it is obvious, that our *if* has always the signification of the English imperative *give*, and no other. So that the resolution of the construction in the sentence, "IF *you live honestly you will live happily*," is simply this, "GIVE *you live honestly* (taking *you live honestly* as an abstract noun) *you will live happily*." Your living *happily* is declared to depend upon your living *honestly* as the *condition;* but *give that*, and your happiness is positively asserted. In like manner may such sentences be resolved as,

> I wonder he can move! that he's not fixed!
> IF THAT his feelings be the same with mine.

Thus, "His feelings be the same with mine, *give that*, I wonder he can move," &c. And here we cannot forbear giving our assent to the truth of Mr Horne Tooke's observation, that when the datum upon which any conclusion depends is a sentence, the article *that*, if not expressed, may always be inserted. We do not, however, think the insertion at all times absolutely necessary to complete the syntax; for active verbs govern whole sentences and clauses of sentences as well as substantive nouns. Instances of this occur so frequently in the Latin classics, that they can have escaped no man's notice who has ever read Horace or Virgil with attention. We agree likewise with this most ingenious author, that where the datum is not a sentence, but some noun governed by the verb *if* or *give*, the article *that* can never be inserted. For example, if we be asked how the weather will dispose of us to-morrow, we cannot say: "*If that* fair, it will send us abroad; *if that* foul, it will keep us at home;" but "*if* fair, it will send us abroad," &c. The reason is obvious. The verb in this case directly governs the noun; and the resolved construction is, "*give* fair weather, it will send us abroad; *give* foul weather, it will keep us at home."

An, the other suppositive conjunction mentioned, is nothing else than the imperative of the Anglo-Saxon verb ANAN, which likewise means *to give* or *to grant*. As, "*An* you had an eye behind you, you might see more detraction at your heels than fortune before you;" that is, "*Grant* you had an eye behind you, you might see," &c. This account of the two conditional conjunctions in English is so rational and satisfactory, that we are strongly inclined to believe that all those words which are so called, are in all languages to be accounted for in the same manner. Not indeed that they must all mean precisely *to give* or *grant*, but some word equivalent; such as, *be it, suppose, allow, permit;* which meaning is to be sought for in the particular etymology of each respective language.

The positives above mentioned are either *causal*, such as *because, since, as*, &c.;[1] or *collective*, such as *therefore, wherefore*, &c. The difference between them is this: The causals subjoin causes to effects; as, "the sun is in eclipse, *because* the moon intervenes:" the collectives subjoin effects to causes; as, "the moon intervenes, *therefore*[2] the sun is in eclipse." We therefore use causals in those instances where, the effect being conspicuous, we seek for its cause; and collectives, in demonstration and science, properly so called, where the cause being first known, by its help we discern effects.

As to causal conjunctions, we may further observe, that there is not one of the four species of causes which they are not capable of denoting. For example, the *material* cause; "The trumpet sounds *because* it is made of metal." The *formal;* "The trumpet sounds *because* it is long and hollow." The *efficient;* "The trumpet sounds *because* an artist blows it." The *final;* "The trumpet sounds *that* it may raise our courage." It is worth observing, that the first three causes are expressed by the strongest affirmation; because if the effect actually be, these must be also. But this is not the case with respect to the last, which is only affirmed as a thing that may happen. The reason is obvious; for whatever may be the end which set the artist first to work, that end it may still be beyond his power to obtain; as, like all other contingents, it may either happen or not. Hence also it is connected by a particular conjunction, *that*,[3] absolutely confined to this cause.

We come now to the *disjunctive conjunctions*, a species of words which bear this contradictory name, because whilst they *conjoin* the sentences, they *disjoin* the sense; or, to speak a language more intelligible, they denote relations of *diversity* or *opposition*.

That there should be such words, whether called conjunctions or not, is extremely natural. For as there is a principle of *union* diffused throughout all things, by which *this whole* is kept together and preserved from dissipation; so is there in like manner a principle of *diversity* diffused throughout all, the source of distinction, of number, and of order. Now it is to express in some degree the modifications of this diversity, that those words called *disjunctive conjunctions* are employed.

Of these disjunctives some are *simple* and some *adversative:* Simple, as when we say, "*either* it is day or it is night;" adversative, as when we say, "it is not day, *but* it is night." The difference between these is, that the simple express nothing more than a relation of *diversity;* the adversative express a relation not barely of diversity, but also of *opposition*. Add to this, that the adversatives are *definite*, the simple *indefinite*. Thus, when we say, "the number three is not an even number, *but*[4] an odd," we not only disjoin two opposite attributes, but we definitely af-

---

[1] Of the causal conjunctions mentioned in the text, *because* has been already considered; and some account must be given of the two words *since* and *as*. The former of these, according to Mr Horne Tooke, is a very corrupt abbreviation, confounding together different words and different combinations of words. To us it appears to be compounded of SEAND, *seeing*, and ES, *that* or *it;* or of SIN, *seen*, and ES. *Seand* and *sin* are the present and past participles of the Anglo-Saxon verb SEON, *to see*. In modern English *since* is used four ways; two as a preposition affecting words, and two as a conjunction affecting sentences. When used as a preposition, it has always the signification of the past participle SEEN joined to THENCE (that is, *seen and thenceforward*), or else the signification of the past participle *seen* only. When used as a conjunction, it has sometimes the signification of the present participle *seeing*, or *seeing that;* and sometimes the signification of the past participle *seen*, or *seen that*. We shall give examples of all these significations. 1*st*, As a preposition signifying SEEN *and thenceforward:* "A more amiable sovereign than George III. has not swayed the English sceptre SINCE *the conquest*." That is, "*The conquest seen* (or at the completion of the sight of the conquest), and thenceforward, a more amiable sovereign than George III. has not swayed the English sceptre." *Since*, taken in this sense, seems rather to be a corruption of *siththan* or *sithence*, than a compound of *seand* and *es*. 2*dly*, As a preposition signifying SEEN simply: "Did George II. reign *before* or SINCE that example?" 3*dly*, As a conjunction, *since* means *seeing that:* as, "If I should labour for any other satisfaction but that of my own mind, it would be an effect of frenzy in me, not of hope; SINCE (or *seeing that*) it is not truth, but opinion, that can travel through the world without a passport." 4*thly*, It means *seen that* or *that seen;* as, "*Since* death in the end takes from all whatsoever fortune or force takes from any one, it were a foolish madness in the shipwreck of worldly things, when all sinks but the sorrow, to save that;" that is, "Death in the end takes from all whatsoever fortune or force takes from any one; *that seen*, it were a foolish madness," &c.

As, the other *causal* conjunction mentioned in the text, is an article meaning always *it*, or *that*, or *which*. Take the following example:

She glides away under the foamy seas
As swift AS darts or feather'd arrows fly.

That is, "She glides away (with) *that* swiftness (with) *which* darts or feathered arrows fly." In German, where *as* still retains its original signification and use, it is written *es*. *So* is another conjunction of the same import with *as*, being evidently the Gothic article *sa* or *so*, which signifies *it* or *that*.

[2] As Mr Harris has called *therefore, wherefore*, &c. collective conjunctions, we have retained the denomination, though perhaps a more proper one might be found. It is indeed of little consequence what name any class of words be called, provided the import of the words themselves be understood. *Wherefore* and *therefore* evidently denote the relation of a cause to its effects. They are compounds of the Saxon words HWÆR and THÆR with FOR or VOOR; and signify *for which, for those*, or *for that*. It is worthy of remark, that in some parts of Scotland the common people even at this day use *this* for *these*.

[3] We have already considered the word *that*, and seen that it is never a conjunction, but uniformly a definite article. "The trumpet sounds (for) *that* it may raise our courage;" taking the clause "it may raise our courage" as an abstract noun in concord with *that* and governed by *for*. Or the sentence may be resolved thus: "The trumpet may raise our courage (for) that (purpose) it sounds."

[4] Mr Horne Tooke has favoured us with some ingenious remarks on the two different derivations of the word BUT, when used in the two acceptations which are usually annexed to it, viz. that which it bears in the beginning of a sentence, and that which it has in the middle. He has given it as his opinion, that this word, when employed in the former way, is corruptly put for BOT, the imperative of the Saxon verb BOTAN, *to boot, to superadd, to supply*, &c. and that when used in the latter it is a contraction of BE-UTAN, the imperative of BEON-UTAN, *to be out*. Our ancient writers made the proper distinction between the orthography of the one word and that of the other. Gawin Douglass, in particular, although he frequently confounds the two words, and uses them improperly, does yet abound with many instances of their proper use; and so contrasted, as to awaken, says our author, the most inattentive reader. Of the many examples quoted by him, we shall content ourselves with the two following:

BOT thy worke shall endure in laude and glorie,
BUT spot or fault condigne eterne memorie.

BOT gif the fates, BUT pleid,
At my pleasure suffer it me life to leid.

If this derivation of the word BUT from BOTAN, *to superadd*, be just, the sentence in the text, "the number three is not an even number, BUT an odd," will be equivalent to "the number three is not an even number, superadd (it is) an odd number;" and if so, the opposition is not marked (at least directly) by the word *but*, but by the adjectives *even* and *odd*, which denote attributes in their own nature opposite. It is only when BUT has this sense that it answers to *sed* in Latin, or to *mais* in French. In the second line of the quotation from Gawin Douglass's Preface the word BUT is evidently a contraction of BE-UTAN, and has a sense very different from

Conjunctions.

firm the one to belong to the subject, and deny the other. But when we say, "the number of the stars is *either*[1] even *or* odd," though we assert one attribute to be, and the other not to be, yet the alternative is notwithstanding left indefinite.

As to adversative disjunctives, it has been already said, after Mr Harris, that they imply *opposition;* but the truth seems to be, that they only unite in the same sentence words or phrases of opposite meanings. Now it is obvious, that opposite attributes cannot belong to the same subject; as when we say, "Nereus was beautiful," we cannot *superadd* to this sentence that he was ugly; we cannot say, "he was beautiful *but* ugly." When there is opposition, it must be either of the same attribute in different subjects; as when we say, "Brutus was a patriot, *but* Cæsar was not;" or of different attributes in the same subject, as when we say, "Georgius was a sophist, *but* not a philosopher;" or of different attributes in different subjects, as when we say, "Plato was a philosopher, *but* Hippias was a sophist." The conjunctions used for all these purposes have been called absolute adversatives, we think improperly, as the opposition is not marked by the conjunctions, but by the words or sentences which they serve to connect. Mr Locke, speaking of the word *but,* says, that "it sometimes intimates a stop of the mind, in the course it was going, before it came to the end of it;" to which Mr Horne Tooke replies with truth, that *but* itself is the farthest of any word in the language from intimating a stop. On the contrary, it always intimates something to follow; insomuch that when any man in discourse finishes his words with *but,* instead of supposing him to have stopped, we always ask, *but* what?

Besides the adversatives already mentioned, there are two other species, of which the most important are *unless* and *although.* For example, "Troy will be taken, *unless* the palladium be preserved; Troy will be taken, *although* Hector defend it." The nature of these adversatives may thus be explained. As every event is naturally allied to its cause, so by parity of reason it is opposed to its preventive; and as every cause is either adequate or inadequate (inadequate when it endeavours without being effectual), so in like manner is every preventive. Now adequate preventives are expressed by such adversatives as *unless:* "Troy will be taken, *unless* the palladium be preserved;" that is, this alone is sufficient to prevent it. The inadequate are expressed by such adversatives as *although:* "Troy will be taken, *although* Hector defend it;" that is, Hector's defence will prove ineffectual. These may be called adversatives *adequate* and *inadequate.*

Conjunctions.

Such is the doctrine of Mr Harris, which, although we can discover in it no determinate meaning, we have ventured with others to retail, from respect to our readers, who may be more perspicacious than ourselves. The author was a man of great learning, and the subject, as he has treated it, appears to be intricate. But whatever sense or nonsense there may be in what he says of causes and preventives, adequate and inadequate, we have no hesitation in affirming that he has totally mistaken the import of the words *unless* and *although.* From these being called both preventives, the one adequate and the other inadequate, an unwary reader might be led to infer that they denote the same idea or the same relation; and that the whole difference between them is, that the expression of the one is more forcible than that of the other. Nothing, however, can be further than this from the truth. The meaning of *unless* is directly opposite to that of *although. Unless*[2] and *though* are both verbs in the imperative mode; the former signifying *take away* or *dismiss,* the latter *allow, permit, grant, yield, assent.* This being the case, "Troy will be taken *unless* the palladium be preserved," is a sentence equivalent to "*Remove* the palladium be preserved (taking *the palladium be preserved* as an abstract noun, *the preservation of the palladium*) Troy will be taken." Again, "Troy will be taken, *although* Hector defend it," is the same as "Troy will be taken *allow* Hector (to) defend it." The idea, therefore, expressed by *unless* is that of the *removal* of one thing to make way for another; the idea expressed by *although*[3] is that of *allow-*

---

that of BOT in the preceding line. The meaning of the couplet is, "SUPERADD (to something said or supposed to be said before) thy worke shall endure in laude and glorie, BE OUT (id est, *without*) spot or fault." In the following passage from Donne, the word BUT, although written in the same manner, is used in both its meanings: "You must answer that she was brought very near the fire, and as good as thrown in; or else, that she was provoked to it by a divine inspiration. BUT that another divine inspiration moved the beholders to believe that she did therein a noble act, this act of her's might have been calumniated." That is, "You must answer that she was brought very near the fire," &c. "Superadd (to that answer) BE OUT (or *unless* or *without,* for, as will be seen by and by, all those words are of the same import) that another divine inspiration moved," &c. To these remarks and examples it may be worth while to add, that even now BUT is often used by the illiterate Scotch for WITHOUT; as nothing is more common than to hear a clown say, "He came from home *but* his breakfast."

Having mentioned *without* as a word of the same import with *but* when distinguished from *bot,* it may not be improper to consider that word here; for though in modern English it is entirely confined to the office of a preposition, it was formerly used indifferently either as a preposition or a conjunction. *Without,* then, is nothing but the imperative WYRTHAN-UTAN, from the Anglo-Saxon and Gothic verb WEORTHAN, WITHAN, which in the Anglo-Saxon language is incorporated with the verb BEON, *esse.* According to this derivation, which is Mr Horne Tooke's, the word *without,* whether called conjunction or preposition, is the same as *be out;* and such will be its import, should it after all be nothing more than a compound of *with,* which signifies to join, and sometimes to be, and *ute,* out.

[1] *Either* is nothing more than a distributive pronoun which every body understands, and *or* we have already explained.

[2] So low down as in the reign of Queen Elizabeth, says Mr Horne Tooke, this conjunction was sometimes written *oneles* or *onelesse;* but more anciently it was written *onles* and sometimes *onlesse.* Thus, in the trial of Sir John Oldcastle in 1413, "It was not impossible for them to make whole Christes cote without seme, *onlesse* certeyn great men were brought out of the way." So, in "The image of governance," by Sir T. Elliot, 1451, "Men do fere to approache unto their sovereigne Lord *oneles* they be called." So again, in "A necessary doctrine and erudition for any Christian man, set furthe by the king's majestie of England," 1543, "*Onles* ye believe, ye shall not understande." "No man shall be crowned, *onles* he lawfully fight." "The soul waxeth feeble, *onlesse* the same be cherished." "It cannot begynne, *onelesse* by the grace of God." Now ONLES is the imperative of the Anglo-Saxon verb ONLESAN, *to dismiss* or *remove.*

LES, the imperative of LESAN, which has the same meaning as ONLESAN, is likewise used sometimes by old writers instead of *unless.* Instances might be given in abundance from Gawin Douglass and Ben Jonson; but perhaps it may be of more importance to remark, that it is this same imperative LES which, placed at the end of nouns, and coalescing with them, has given to our language such adjectives as *hopeless, restless, deathless, motionless,* &c. that is, *dismiss* hope, rest, death, motion, &c.

Mr Horne Tooke observes, that all the languages which have a conjunction corresponding to *less* or *unless,* as well as the manner in which the place of these words is supplied in the languages which have not a conjunction correspondent to them, strongly justify his derivation which we have adopted. The Greek *ειμη,* the Latin *nisi,* the Italian *se non,* the Spanish *sino,* the French *si non,* all mean *be it not.* And in the same manner do we sometimes supply its place in English by *but, without, be it not, but if,* &c. It may be proper just to add, that, according to the same author, the conjunction *lest* is a contraction of *lesed,* the past participle of LESEN; and that *lest* with the article *that,* either expressed or understood, means no more than *hoc dimisso* or *quo dimisso.*

[3] *Although* is compounded of *al* or *all,* and *tho', though, that,* or, as the vulgar more purely pronounce it, *thaf, thauf,* and *thof.* Now

Prepositions.

in one thing to *co-exist* with another, with which it is *apparently* incompatible.

Before we take leave of this subject, we might treat, as others have treated, of adverbial conjunctions, and conjunctions of various other denominations.[1] But of multiplying subdivisions there is no end; and systems in which they abound convey for the most part no information. The nature of conjunctions can be thoroughly understood only by tracing each to its original in some parent or cognate tongue; and when that shall be done in other languages with as much success as it has been done by Mr Horne Tooke in English, then, and not till then, may we hope to see a rational, comprehensive, and consistent theory of this part of speech. Then too shall we get rid of all that farrago of useless distinctions into conjunctive, adjunctive, disjunctive, subjunctive, copulative, continuative, subcontinuative, positive, suppositive, causal, collective, preventive, adequate and inadequate, adversative, conditional, illative, and the like, which explain nothing, and which serve only to veil ignorance and perplex sagacity.

That Mr Horne Tooke's principles will apply exactly to the conjunctions of every language both dead and living, is what our limited knowledge of these languages does not authorize us positively to affirm. It is, however, a strong presumption in favour of his opinion, that illiterate savages, the first cultivators of language, are little likely to have sent out their faculties in quest of words to denote the abstract relations subsisting among their ideas, when we have such evidence as his book affords, that the names of the most common substances and qualities could answer that and every other purpose, which in the ordinary intercourse of life can be answered by the faculty of speech. It is a further presumption in his favour, that in the rudest languages there are few if any conjunctions; and that even in others which are the most highly polished, such as Greek and Latin, as well as English, many of those words which have been called conjunctions are obviously resolvable into other parts of speech. Thus αλλα, translated *but*, is evidently the neuter gender of either the nominative or accusative plural of αλλος, *another*; and when used as a conjunction, it intimates that you are going to add something to what you have already said. *Cæterum* has the same meaning, and is nothing but και ἑτερον. MAIS, *but*, in French, is the Latin *majus*; *ut*, *uti*, ὁτι, *quod*, is the relative pronoun. Of *quocirca*, *quia*, *præterea*, *antequam*, *quenquam*, *quemvis*, *quantumvis*, *quamlibet*, &c. the resolution is too obvious to require being mentioned. Where such resolutions as these can be made, or when the conjunctions of any particular tongue can be traced to their origin in any other, there needs be no dispute about their true import; but when the case is otherwise, and the conjunction either appears to be an original word, or is derived from a source to which it cannot be traced, we would advise such of our readers as wish to speak or write correctly, to dismiss from their minds all consideration of copulatives, continuatives, causals, and disjunctives, with the rest of that jargon which we have already mentioned; and to inquire diligently in what manner and for what purpose the conjunction in question is used by the best writers, both ancient and modern, of the particular language which they are studying. This will indeed be found a work of labour; but it appears to us to be the only means left of discovering the precise relations which such conjunctions were intended to express; and, by consequence, of knowing what words or sentences they are fitted to connect, so as to produce a style at once accurate and perspicuous.

2. *Of Prepositions.*

By Mr Harris and his followers, a *preposition* is defined to be a part of speech devoid itself of signification, but so formed as to unite two words that are significant, and that refuse to coalesce or unite of themselves. We have already expressed our opinion of that theory which holds certain words to be devoid of signification; but its absurdity, in the present instance, is more than ever glaring. Concerning the number of *prepositions*, it is well known that hitherto authors have never been agreed. The ancient Greek grammarians admitted only eighteen, the ancient Latin grammarians above fifty; though the moderns, Sanctius, Sciopius, Perizonius, Vossius, and Ruddiman, have endeavoured to lessen the number without fixing it. Bishop

---

thaf or *thauf* is evidently the imperative THAF or THAFIG of the verb THAFIAN or THAFIGAN, *to allow, permit, grant, yield, assent*; and THAFIG becomes *thah*, *though*, *thoug*, and *thoch*, as Gawin Douglass and other Scottish authors write it, by a transition of the same sort and at least as easy as that by which HAFUC becomes *hawk*. It is no small confirmation of this etymology, that anciently they often used *all be*, *albeit*, *all had*, *all were*, *all give*, instead of ALTHOUGH; and that as the Latin SI (*if*) means *be it*, and NISI and SINE, *unless* and *without*, mean *be not*, so ETSI, *although*, means *and be it*.

[1] In a work of this kind, which professes to treat of universal grammar, it would be impertinent to waste our own and our reader's time on a minute analysis of each conjunction which may occur in any one particular language. We shall therefore pursue the subject no further; but shall subjoin Mr Horne Tooke's table of the English conjunctions, referring those who are desirous of fuller satisfaction to his ingenious work entitled *The Diversions of Purley*.

IF	Are the Imperatives	GIF	Of their respective verbs	GIF	To give.
AN		AN		ANAN	To grant.
UNLESS		ONLES		ONLESAN	To dismiss.
EKE		EAC		EAKAN	To add.
YET		GET		GETAN	To get.
STILL		STELL		STELLAN	To put.
ELSE		ALES		ALESAN	To diminish.
THOUGH		THAFIG		THAFIGAN	To allow.
or		or		or	
THO'		THAF		THAFIAN	
BUT		BOT		BOTAN	To boot, or superadd.
BUT		BE-UTAN		BEON-UTAN	To be out.
WITHOUT		WYRTH-UTAN		WYRTHAN-UTAN	To be out.
AND		AN AD		ANAN AD	Dare congeriem.

LEST is the participle LESED, of LESAN, to dismiss.

SINCE	SITHTHAN	is the participle of SEON, to see.
	SYNE	
	SEAND-ES	
	SITHTHE	
	or	
	SIN-ES	

THAT is the article or pronoun THAT.

As is ES, a German article, meaning *it*, *that*, or *which*. And

So is SA or SO, a Gothic article of the same import with AS.

Wilkins thinks that thirty-six are sufficient; and Girard says that the French language has done the business effectually with thirty-two. But if prepositions be words devoid of signification, why should there be disputes respecting their numbers? or why in any language should there be more than *one* preposition, since a single unmeaning mark of connection would certainly answer the purpose as well as a thousand? The cipher, which has no value of itself, and only serves, if we may use the language of grammarians, to connote and consignify, and to change the value of figures, is not several and various, but uniformly one and the same. That "the preposition is so formed as to unite two words which refuse to coalesce or unite of themselves," is indeed true; and this union it effects, not by having no signification of its own, but by signifying the relation by which the things expressed by the *united* words are connected in nature. Prepositions are to be accounted for in much the same manner as the cases of nouns. The necessity of this species of words, or of some equivalent invention, follows from the impossibility of having in language a distinct complex term for each distinct collection of ideas which we may have occasion to put together in discourse. The addition or subtraction of any one idea to or from a collection of ideas, makes it a different collection; and if, after either of these operations, it were to be expressed by the same word as before, nothing could ensue but misrepresentation and falsehood. Now, to use in language a different and distinct complex term for each different and distinct collection of ideas, is equally impossible as to use a distinct particular term for each particular and individual idea. To supply, therefore, the place of the complex terms which are wanting in a language, are the cases of nouns and prepositions employed; by the aid of which, complex and general terms are prevented from being infinite or too numerous, and are used only for those collections of ideas which we have most frequent occasion to mention in discourse. By means of prepositions this end is obtained in the most simple manner. For, having occasion to mention a collection of ideas, for which there is no single complex term in the language, we either take that complex term which includes the greatest number, though not all, of the ideas we would communicate; or else we take that complex term which includes all and the fewest ideas more than those we would communicate; and then, by the help of the preposition, we either make up the deficiency in the one case, or retrench the superfluity in the other. For instance, having occasion to mention a house of a particular description, and knowing that the term *house* is too general for our purpose, and that the building we have in view has no appropriate name, we say, perhaps, "a house *with* a party-wall," or a "house *without* a roof." In the first instance, the complex term *house* is deficient, and the preposition directs to add what is wanting; in the second instance, the complex term is redundant, as it denotes a complete house. The preposition, therefore, directs to take away what is superfluous.

Now, considering prepositions in this the most simple light, as serving only to limit or modify general terms, it is absolutely necessary that they should have meanings of their own; for otherwise, how could we, in the instance before us, make known by them our intention, whether of adding to, or retrenching from, the same general term *house*. If, to a disciple of Mr Harris, we should say, *a house* JOIN; he would reply *join what?* But he would not contend that *join* is an indeclinable word which has no meaning of its own, because he knows that it is the imperative of a verb, of which the other parts are still in use; and its own meaning is clear, though the sentence is not completed. If, instead of *join*, we should say to him, *a house* WITH, he would still ask the same question, *with what?* But if we were to discourse with him concerning the word *with*, he would probably tell us that *with* is a preposition, an indeclinable word, which is itself devoid of signification, but so formed as to unite two words that are significant. And yet it would be evident by his question, that he felt it had a meaning of its own; which is in reality the same as *join*.[1] Indeed, so far has always been plainly perceived, that *with* and *without* are directly opposite and contradictory; and it would puzzle the most acute philosopher to discover opposition and contradiction in two words where neither of them had any signification. Wilkins, therefore, has well expressed their meaning, where he says, that *with* is a preposition "relating to the notion of social, or circumstance of society *affirmed*; and that *without* is a preposition relating to the same notion of social, or circumstance of society *denied*."

But to denote the relations of adding and taking away, is not the only purpose for which prepositions are employed. They all indeed serve to modify some general term or general affirmation, but not precisely in the same way as *with* and *without*. It has already been observed, that words significant of those things which coincide in nature, coalesce with one another in syntax, without being beholden to any auxiliary tie. For instance, an adjective coalesces with its substantive, a verb with its nominative; a noun expressing an object acted upon, with a verb de-

---

[1] This account of prepositions is taken from Mr Horne Tooke, who adds, that the only difference between the two words *with* and *join*, is, that the other parts of the Gothic and Anglo-Saxon verb WITHAN, *to join* (of which *with* is the imperative), have ceased to be employed in the language. As WITH means *join*, so the corresponding French preposition *avec* means, *and have that*, or *have that also.* But though *with*, as the imperative of WITHAN, means *join*, it has sometimes a very different signification. Mr Tyrwhit in his Glossary has truly observed, that *with* and *by* are often synonymous. They certainly are so; but then *with* seems to be an abbreviation of the imperative of WYRTHAN, *to be*; as *without* is of WYRTHAN-UTAN, *to be out*. This being the case, our two instances in the text will stand thus: *a house* JOIN *a party-wall*; *a house* BE-OUT *a roof*. Nor let any one be surprised that we make no difference between the conjunction *without* and the preposition *without*. The word is the same, whether it be employed to unite words or sentences. Prepositions were originally, and for a long time, classed with conjunctions; and when first separated from them, they were only distinguished by the name of prepositive conjunctions. They are generally used to unite words, but not always; for we may say indifferently, "I came after *his departure*," or "I came after *he departed*." By the greater part of grammarians indeed, *after*, when employed as in the first sentence, is classed with the prepositions; when employed as in the second, it is classed with the conjunctions. The word, however, is the same in both sentences; its meaning is the same, and its effect precisely the same. The only circumstance of discrimination is, that in the first example it is prefixed to a noun, "his departure;" in the second, it is prefixed to a nominative and a verb, "he departed." But even the nominative and the verb, thus applied, express no more than a specifying circumstance annexed to the other proposition, "I came;" and whenever they are rightly apprehended by the mind, they are stripped of their prepositionary form, and considered abstractedly under a new phasis, "his departure." Thus then the two sentences are synonymous in every respect, excepting the apparent grammatical nature of the words "his departure," and "he departed;" and even these are reduced to one grammatical form in the mind, whenever the import of the propositions is rightly apprehended. *Without*, and many other prepositions, especially in the learned languages, are used exactly as *after* is used in the two instances which we have given. Mr Horne Tooke quotes Lord Mansfield for saying, "It cannot be read *without* the attorney-general consents to it." This, in modern English, is not the common phraseology; but it offends not against any principle of grammar. The nominative and the verb are here, as in the former instance, considered as an abstract noun. "It cannot be read WITHOUT the consent of the attorney-general."

Prepositions.

noting action; and an adverb with its verb. Take the following example: "*The splendid sun genially warmeth the fertile earth.*" But suppose we were desirous to modify this affirmation by the addition of other substantives, *air*, for instance, and *beams*; how would these coincide with the other words of the sentence, or under what character could they be introduced? Not as nominatives or accusatives to the verb, for both these places are already filled; the nominative by the substance *sun*, which is certainly the agent in this operation; the accusative by the substance *earth*, which is as certainly the object acted upon. Not as qualities of the *sun* and *earth*; for qualities inhering in their substances can only be expressed by adjectives, and the words air and beams are both substantives. Here then we must have recourse to prepositions; but we can employ only such prepositions as point out the relations which the *air* and the *beams* have to the sun warming the earth. In English we should say, "the splendid sun *with* his beams genially warmeth *through* the air the fertile earth." The sentence, as before, remains entire and one; the substantives required are both introduced; and not a word which was there before is detruded from its proper place. The import of *with* we have already discovered; it directs to *unite* the beams to the sun, as *jointly* with him performing the operation. But the *air* has no other connection with the operation, than as the *medium* or *passage* between the *sun* and the *earth*; and therefore the preposition *through*[1] must denote that relation which subsists between an object in motion and the medium in which it moves; nor could a preposition of a different import have been employed, without altering the meaning of the whole sentence.[2]

Mr Harris is of opinion that most, if not all, prepositions were originally formed to denote the relations of *place*. For this opinion we see not sufficient evidence. If indeed we could suppose the inventors or earliest improvers of language to have at all concerned themselves with relations as abstracted from the objects related, we must believe that those which first attracted their attention were the relations subsisting among themselves, and the various bodies with which they were surrounded. We must likewise agree with our author, that place is the grand relation which bodies or natural substances maintain at all times to one another; but we do not therefore think that it would attract the earliest notice of untaught barbarians. On the contrary, we are of opinion that mankind must have made very considerable progress in science before they attempted to abstract place from body; an attempt which, according to some of the most profound philosophers,[3] is not only difficult, but absolutely impracticable. But whatever be in this, the relations of cause and effect, of duration and motion, are in themselves as obvious, and as likely to arrest the attention and obtain names, as those of place. Amongst men totally illiterate they are evidently more so; for pain and pleasure would suggest some idea of cause and effect as matters of importance. There is, however, no probability that the inventors of any language had the least idea of abstract relations. They doubtless expressed complex conceptions by nouns and verbs, significant at once of the particular ideas and of the various relations by which they viewed those ideas as combined together in a complex conception. Afterwards, when men's minds became enlarged, and when, from the fluctuation inseparable from a living language, objects or ideas received new names, the old words, whether nouns or verbs, which were originally employed to express a particular complex conception, of which certain particular *relations* made a part, might be retained for the purpose of denoting those and all similar *relations*; and thus verbs and nouns would degenerate into particles bearing the names of prepositions and conjunctions. For instance, one Anglo-Saxon being desirous to communicate to another his own conception of a house with a party-wall, and having, we shall suppose, no such word in his tongue as a preposition, would naturally utter the word *house*, desiring his friend, at the same time, to add to that well-known sound another sound (uttering it) significant of the particular circumstance wanting to complete his complex conception, viz. a house *with* (that is *join*) a party-wall. The word *with*, as the imperative of a verb, denotes of course three ideas combined together, namely, a command or wish, an affirmation, and the idea of junction. But when the verb *withan* was dismissed from the English language, the imperative *with* was still retained; but losing its verbal and modal nature, it was thenceforth employed to denote only one of the three ideas for which it originally stood, viz. the idea of junction. And thus it is that verbs, and also nouns and adjectives, in passing from one language to another, may become prepositions[4] and conjunctions. Thus too it is that some of those prepositions come to denote the contiguous, and some the detached, relation of body. The contiguous, as when we say, "Caius walked *with* a staff;" that is, "Caius *join* a staff, walked;" "the statue stood *upon*[5] a pedestal;" that is, "the statue stood (the place of its standing) the *higher part* of a pedestal;" "the river ran

---

[1] *Thorough*, *thourough*, *thorow*, *through*, or *thro'*, is no other, says Mr Horne Tooke, than the Gothic substantive DAURO, or the Teutonic substantive THURUH, and, like them, means *door*, *gate*, *passage*. So that the sentence in the text, resolved upon his principles, stands thus: "The splendid sun—*join* his beams—genially warmeth—PASSAGE *the air* (or, the air being the *passage* or *medium*)—the fertile earth." And in the same manner may we translate the preposition *through* in every instance where *through* is used in English, or its equivalent preposition in any language; as from the Latin and Italian word *porta*, in Spanish *puerta*, and in French *porte*, have come the Latin and Italian preposition *per*, the French *par*, and the Spanish *por*.

[2] If, for instance, we were to substitute *with* or *of* instead of *through*, we should in the one case alter the meaning, and in the other speak nonsense. "The sun warmeth *with* the air the fertile earth," is an affirmation that "the sun warmeth *both the air and the earth*;" whereas the original sentence affirmed nothing more than that "he warmeth the *earth*." "The sun warmeth *of* the air the fertile earth," is nonsense, as it makes the earth a *part*, or a *consequence*, of the air. So necessary is it that prepositions have a meaning, and that the meaning of each be attended to.

[3] Bishops Berkeley and Law, with Principal Campbell of Aberdeen. See *The Principles of Human Knowledge*, Law's *Notes* on King's *Origin of Evil*, and *The Philosophy of Rhetoric*.

[4] As the Italian substantive *casa*, a house, race, family, nation, &c. in passing to the French, becomes the preposition *chez*, to which there is not, so far as we know, a preposition of precisely the same import in any language. *Senza* or *senze*, in Italian, becomes *sans* in French, and means *absence*. Nor is it necessary that verbs and nouns should always pass from one language to another, in order to be converted into prepositions. The Greek preposition χωρὶς is evidently the corrupted imperative of χωρίζειν, *to sever*, *to disjoin*, *to separate*. The Latin *sine* is *sit ne*, *be not*. The German *sonder* is the imperative of *sondern*, which has the same meaning as χωρίζειν.

[5] *Up*, *upon*, *over*, *'bove*, *above*, have all, says Mr Horne Tooke, one common origin and signification. In the Anglo-Saxon, UFA, UFERA, UFEMÆST, are the adjectives *altus*, *altior*, *altissimus*. UFA or UFAN, *up*; comparative UFERA, OFERE, or OFER, *over* or *upper*; superlative UFEMÆST, *utmost* or *uppermost*. BEUFAN, BUFAN, ON BUFAN, *'bove*, *above*. If this be a just account of the origin of these words, the sentences in the text, where *upon*, *over*, and *above*, occur, will run thus: "The statue stood *on high* a pedestal;" "the river ran *higher* a sand;" "the sun is risen *on high* the hills." And here we may observe, that the mere relation between standing, running, &c. and place, is rather inferred from the verb itself, than expressed by a separate word. The reason is obvious. For if a statue stand, every one knows that it must stand on some thing as well as at some time. There is therefore no necessity, whatever elegance there may be in it, for employing any word to denote that relation, which is commonly believed to be signified by *on*; but it is

Prepositions.

Prepositions.

over a sand," that is, "the river ran (the place of its running) the *higher part* of a sand." The detached relation, as when we say, "He is going to[1] Italy," that is, "He is going, *the end* (of his journey) Italy;" "the sun is risen *above* the hills," that is, "the sun is risen (the place) *the top* of the hills;" "these figs came *from* Turkey," that is "these figs came *beginning* (their journey at) Turkey."

Besides the detached relation of body, Mr Harris is of opinion that the preposition *from* denotes two other relations not less different than those of motion and rest. Thus, if we say, "That lamp hangs *from* the ceiling," the preposition *from* assumes a character of quiescence. But if we say, "That lamp is falling *from* the ceiling," the preposition in such case assumes a character of motion. But this is evidently a mistake. The detached relation in the former instance of the *figs*, as well as the motion and rest in the present instances, are expressed not by the preposition, but by the verbs, *came*, *falls*, *hangs*. The word *from* has as clear, as precise, and at all times as uniform and unequivocal a meaning, as any word in the language. *From* means merely *beginning*, and nothing else. It is simply the Anglo-Saxon and Gothic noun FRUM, *beginning*, *origin*, *source*, *fountain*, *author*.[2] Now if this meaning be applied to Mr Harris's instances, *from* will speak clearly for itself, without the assistance of the interpreting verbs, which are supposed by him to *vary its character*.

---

necessary to insert, between the verb and pedestal, a word significant of place, that pedestal may not be mistaken, by an ignorant person, for a portion of time, or any thing else connected with the standing of the statue.

[1] That *to* is significant of detached relation, is the language of Mr Harris, which, though it may be allowed in a loose and vulgar sense, is certainly not philosophically just. The preposition *to*, in Dutch written *toe* and *tot*, is the Gothic substantive TAUI or TAUHTS, signifying *act*, *effect*, *result*, or *consummation*; which Gothic substantive is itself no other than the past participle TAUID or TAUIDS of the verb TAUJAN, *agere*. And it is obvious that what is done is terminated, ended, finished. In the Teutonic this verb is written TUAN or TUON; whence the modern German THUN, and its preposition *tu*. In the Anglo-Saxon, the verb is TEOGAN, and the preposition *to*. *Do*, the auxiliary verb, as it has been called, is derived from the same root, and is indeed the same word as *to*. The difference between a T and a D is so very small, that an etymologist knows by the practice of languages, and an anatomist by the reason of that practice, that in the derivation of words it is scarcely worth regarding. To support this etymon of *to*, Mr Horne Tooke gives a similar instance in the Latin tongue. The preposition *ad*, he says, is merely the past participle of *agere*, which past participle is likewise employed as a Latin substantive. He exhibits the derivation of *ad* thus:

$$\textit{Agitum—agtum}\left\{\begin{array}{ccccc}\text{AGDUM}&\text{——}&\text{AGD}&\text{——}&\text{AD}\\ \text{or}&&\text{or}&&\text{or}\\ \text{ACTUM}&\text{——}&\text{ACT}&\text{——}&\text{AT.}\end{array}\right.$$

The most superficial reader of Latin verse, he observes, knows how readily the Romans dropped their final *um*. And a little consideration of the organs and practice of speech will convince him how easily *agd* or *act* would become *ad* or *at*; as indeed this preposition was indifferently written either way by the ancients. By the later writers of Rome, the preposition was written *ad* with *d* only, in order to distinguish it from the other corrupt word called the conjunction *at*; which for the same reason was written with the *t* only, though that likewise had anciently been written, as the preposition, either *ad* or *at*. The preposition *to* and the conjunction *too* in English, are both in syntax and in meaning used exactly as the preposition *ad* and the conjunction *at* in Latin. From the specimens prefixed to Johnson's Dictionary, as a history of our language, it appears that, as late as the reign of Elizabeth, the preposition and conjunction were both written with one *o*. And it has been shown in the first volume of the Transactions of the Royal Society of Edinburgh, that *to* and *too*, as well as *ad* and *at*, are precisely of the same import. The only difference, in either language, between the preposition and the conjunction, is, that the former directs, as a modification of some previous proposition, the addition of some substantive or noun; the latter, sometimes a sentence or clause of a sentence considered abstractedly as a noun; and that, when the former is used, the preposition to which the modifying circumstance is to be added, is formally expressed, but omitted when the latter is employed. Thus Denham says,

Wisdom he has, and *to* his wisdom courage;
Temper *to* that, and *unto* all success.

In this example, every succeeding circumstance is by the preposition *to* marked as an addition to the preceding. "Wisdom he has, and courage *additional* to his wisdom." But Denham might with equal propriety have omitted the object which *to* governs, or to which it directs something to be *added*, though he must then, from the custom of the language, have employed the conjunction instead of the preposition. As,

Wisdom he has, and courage *too*.

That this mode of expression would have been more concise than, and as intelligible as, the other, "Wisdom he has, and courage *to* his wisdom," must be evident to every one.

Not only is the object governed by *to* omitted, when it is represented by a substantive in the context, but also when it is involved in a preposition; and then the conjunction, as it is called, is always used. Thus,

Let those eyes that view
The daring crime, behold the vengeance *too*.

So, "He made him prisoner, and killed him *too*." In the one example, the circumstance of beholding the vengeance is stated as an *addition* to the viewing of the crime; and in the other, the *killing him* is stated as an *addition* to the making him a prisoner. In both examples, the object governed by *too* is the amount of the preceding proposition taken abstractedly as a noun or substantive. Thus then it appears, that *to* and *too*, though classed the one with the prepositions, and the other with the conjunctions, are really one and the same word. The same is true of *ad* and *at*. Thus, "AD *hoc*, promissa barba et capilli efferaverant speciem oris," signifies "*Additional to this*, his long beard and hair had given a wildness to his aspect." But when the object governed by *ad* is not formally stated, *ad* itself is classed with the conjunctions, and written differently, *at*. Thus Terence, "*Ph.* Fac ita ut jussi, deducantur isti. *Pa.* Faciam. *Ph. At* diligenter. *Pa.* Fiet. *Ph. At* mature." By the means of *at*, the circumstances of *diligence* and *haste* are *superadded* to the action commanded. "*Ph.* It is not enough that you do it; you must do it carefully *too*. *Pa.* Well, it shall be carefully done. *Ph.* In good time *too*." *At*, taken in this sense, is most commonly employed, like the English *but*, to mark the unexpected union of incongruous objects; as, "Aulam tyranni frequentabat, *at* patriam amabat;" literally, "He frequented the court of the tyrant; joined *even to* that he loved his country." "He was a courtier and a patriot *too*." But if *ad* and *at* in Latin, and *to* and *too* in English, be derived from verbs which signify *to do* or *act*, it may be asked how they come themselves to denote *addition*. The answer is obvious. If a man should utter a sentence, and to the end of it subjoin the very general word *do*, the person to whom he spoke would naturally ask, *do* what? and this question would, of course, produce an additional sentence or clause of a sentence. Besides, it is to be observed, that *agere*, from which the Latin preposition is derived, as well as the Gothic verb, which is the source of the English particles, means not only *to do*, but also to adduce or bring; so that when we say, "he is going *to* Italy," we do nothing more than affirm that "he is going," and desire the person to whom we speak, "to *add* Italy to the journey."

From this derivation of the preposition *to*, it will be seen at once upon what principle it is employed to mark the infinitive mode. In the learned languages that mode is generally known by its termination; but in English it would be impossible, without the aid of *to*, or of some other word significant of action, to distinguish the verb *love* from the noun or substantive.

[2] This derivation is Mr Horne Tooke's; and he supports it by the following sentence: *Ne rædd ge se the on frumman worhte, he worhte wæpman and wifmen;* which is the Anglo-Saxon of St Matthew, xix. 4, "Annon legistis, quod qui eos *in principio* creavit, creavit eos marem et feminam?"

These figs *came* FROM Turkey.
That lamp *falls* FROM the ceiling.
That lamp *hangs* FROM the ceiling.

Came is a complex term for one species of motion; *falls* is a complex term for another species of motion; and *hangs* is a complex[1] term for a species of attachment. Have we occasion to communicate or mention the *commencement* or *beginning* of these motions, and of this attachment, and also the place where they commence or begin? To have complex terms for each occasion of this sort is absolutely impossible; and therefore nothing can be more natural or more simple than to add the signs of those ideas, viz. the word *beginning*, which will remain always the same, and the NAME of the *place*, which will perpetually vary. Thus,

These figs came—*BEGINNING Turkey.*
That lamp falls—*BEGINNING ceiling.*
That lamp hangs—*BEGINNING ceiling.*
That is,
Turkey the *place* of BEGINNING to come.
Ceiling the *place* of BEGINNING to fall.
Ceiling the *place* of BEGINNING to hang.

It has been said by no less a man than Bishop Wilkins, that *from* refers primarily to place, and secondarily to time. But the truth is, that *from* relates to every thing to which *beginning* relates, and to nothing else.

> *From* morn till night the eternal larum rang.

That is, the "larum rang *beginning* morning," or morning being the *time* of its *beginning*, till night.

As *from* always denotes beginning, so *to* and *till* always denote the end. There is, however, this difference between them, that *to* denotes the end of any thing; *till* the end only of time. We may say indifferently, "From morn *to* night," or "from morn *till* night, the eternal larum rang;" but we cannot say, "These figs came from Turkey *till* England." That *till* can, with propriety, be opposed to *from* only when we are talking of time, is evident; for it is a word compounded of *to* and *while*, that is, time. And as the coalescence of these two words *to-while* took place in the language long before the present superfluous use of the article *the*, the phrase, "From morn *till* night" is neither more nor less than "From morn *to time* night." When we say, "from morn *to* night," the word *time* is omitted as unnecessary.

Besides *from*, Mr Harris mentions *over* as significant sometimes of motion and sometimes of rest; and quotes as instances the two following passages from Milton:

> …………To support uneasy steps
> *Over* the burning marl.

Here, says he, *over* denotes *motion*. Again,

> …………He with looks of cordial love
> Hung *over* her enamoured.

Here *over* denotes rest. But the truth is, that *over* denotes neither motion nor rest in either of these passages. In the first quotation, indeed, *motion* is implied; but it is implied in the word *steps*, and not in *over*, which denotes only that the place of the steps was the top of the burning marl. In the second quotation, rest is implied, and that too a particular *species* of rest; but it is implied, or rather expressed, by the verb *hung*, and *over* denotes the place of that species of rest.

But though the original use of prepositions was to denote the relations of body, they could not be confined to this office only. They by degrees extended themselves to subjects incorporeal, and came to denote relations, as well intellectual as local. Thus, because in point of place he who is above has commonly the advantage of him who is below; hence we transfer *over* and *under*[2] to dominion and obedience. Of a king we say, "he ruled *over* his people;" and of a soldier, "he served *under* his general." So too we say, *with* thought; *without* attention; thinking *over* a subject; *under* anxiety; *from* fear; *through* jealousy, and the like. All which instances, with many others of a similar kind, show that the first words of men, like their first ideas, had an immediate reference to sensible objects; and that in after days, when they began to discern with their intellect, they took those words which they found already made, and transferred them by metaphor to intellectual conceptions.

Amongst the relations which may be considered rather as intellectual than corporeal, are those of cause and consequence; and for the denoting of these we have two prepositions, which sometimes *appear* in direct opposition to one another, and at other times may exchange places without injury to the sense.

"Well! 'tis e'en so! I have the London disease they call love. I am sick *of* my husband, and *for* my gallant." (Wycherley's *Country Wife.*)

Here *of* and *for* seem almost placed in opposition; at least their effects in the sentence appear to be very different; for, by the help of these two prepositions alone, and without the assistance of any other words, she expresses the two contrary affections of loathing and desire. The truth, however, is, that the author, if it had pleased him, might have used *of* where he has employed FOR, and FOR where he has put *of*. This is evident from the following quotation from the *Sad Shepherd:*

> *Marian.* Come, Amie, you'll go with us.
> *Amie.* I am not well.
> *Lionel.* She's sick *of* the young shepherd that bekist her.

In the same manner we may, with equal propriety, say, "We are sick *of* hunger;" or, "We are sick *for* hunger." And in both cases we shall have expressed precisely the same thing, with only this difference, that, in the former sentence, we declare sickness to be a *consequence;* in the latter we declare hunger to be a *cause.* But to return to the Country Wife, that poor lady seems to have had a complication of distempers; she had at least two disorders; a sickness *of loathing*, and a sickness *of love.* She was sick *for* disgust, and sick *for* love. She was

Sick *of* disgust *for* her husband.
Sick *of* love *for* her gallant.
Sick *for* disgust *of* her husband.
Sick *for* love *of* her gallant.

In the first sentence, as thus stated, sickness is declared to be the *consequence* of disgust, of which her husband is declared to be the *cause.* In the second, sickness is declared to be the *consequence* of love, of which her gallant is declared to be the *cause.* In the third sentence, disgust is declared to be the *cause* of her sickness, and the *consequence* or *offspring* of her husband. In the fourth, love is declared to be the *cause* of her sickness, and the *consequence* or *offspring* of her gallant.

---

[1] These are complex terms because they are verbs. Each denotes an affirmation and time; and, combined with these, *came* and *falls* denote *motion*, and *hangs* denotes *rest.*

[2] *Under* and *beneath*, though by the sound they seem to have little connection, are yet in fact almost the same word, and may very well supply each other's place. *Under* is nothing but *on-neder*, and *beneath* is compounded of the imperative *be* and the noun *neath.* *Neath* uncompounded having slipped away from our language, would perhaps be unintelligible, had not the nouns *nether* and *nethermost* still continued in common use. *Neath*, Anglo-Saxon, *neothan, neothe;* Dutch, *neden;* Danish, *ned;* German, *niedre;* and Swedish, *neder* and *neder;* is undoubtedly as much a substantive, and has the same meaning, as the word *nadir.* In common language it denotes the bottom.

Prepositions.

Thus, then, it appears, that though the first two of these sentences, taken entire, convey the very same meaning with the last two, yet the import of the preposition *for* is as different from that of *of*, as *cause* is from *consequence*.[1] When two words or sentences are linked together by the former of these prepositions, the object expressed by the last word or sentence is declared to be the *cause* of that which is expressed by the preceding; when two words or sentences are linked together by the latter preposition, the object expressed by the first word or sentence is declared to be the *consequence of*, or to *proceed from*, the object expressed by the second. It is therefore a matter of perfect indifference to the sense whether we say "sickness *of* hunger," or "sickness *for* hunger;" "the man, *of* he speaks little, is wise," or "the man is wise, *for* he speaks little." By means of the preposition *of*, we declare sickness to be the *consequence* proceeding from hunger, and wisdom to be the *consequence* we infer from the man's speaking little; by means of *for*, we declare hunger to be the *cause* of sickness, and the circumstance of speaking little to be the *cause* from which we infer the man's wisdom. In the one sentence, *of* is to be considered as a noun in apposition to *sickness*; in the other, as a noun in apposition to *the man is wise* taken abstractedly as a noun. In the one sentence *for* (id est, *cause*) is to be considered as a noun in apposition to *hunger*; in the other, as the same noun in apposition to *he speaks little* taken abstractedly as a noun.

In the foregoing use of prepositions, we have seen how they are applied by way of juxtaposition; that is to say, where they are prefixed to a word without becoming a part of it. But they are used also by way of composition; that is, they are prefixed to other words so as to become real parts of them. Thus in Greek we have ἐπιστασθαι; in Latin, *intelligere;* and in English, *UNDERstand*. So also, to *FOREtell*, or *OVERact*, to *UNDERvalue*, to *OUTgo;* and in Greek and Latin other instances innumerable. In this case the prepositions commonly transfuse something of their own peculiar meaning into the word with which they are compounded. For example, if we suppose some given space, E and EX signify *out of* that space; PER, *through it;* IN, *within it;* SUB, *under it.* Hence, E and PER, in composition, augment: *Enormis* is something not simply big, but big in excess; something got out of the rule, and beyond the measure. *Dico*, "to speak;" *Edico*, "to speak out;" whence *Edictum*, "an edict," something so effectually spoken that all are supposed to hear and to obey. On the contrary, IN and SUB diminish and lessen. *Injustus, INiquus*, "UNjust, INequitable;" something that lies within justice and equity, that reaches not so far, that falls short of them. *SUBniger*, "blackish;" *SUBrubicundus*, "reddish; *tending* to black, and *tending* to red; but yet *under* the standard, and *below* perfection.

Before we dismiss this part of our subject, we shall make the same general remark upon prepositions which we formerly made on conjunctions, viz. that the precise import of each can with certainty be known only by tracing it to its source in some word of known and determinate meaning, either in the language where the preposition itself has place, or in some parent or cognate tongue. And it may be laid down as an infallible rule, that where different languages use the same or a similar particle, that language ought to be considered as its legitimate parent, in which the true meaning of the word can be found, and where its use is as common and familiar as that of any other verbs and substantives. When prepositions can be traced to such sources as these, no room can be left for disputes concerning their meaning. In carrying on this etymological pursuit, we find advantages in the nature of prepositions which conjunctions do not afford us. *With* and *without*, *from* and *to*, with many other words belonging to this class, have meanings directly opposite and contradictory to each other. If, then, by the total or partial extinction of an original language, the root of any one preposition be lost, whilst that of its opposite remains, the philosopher ought to be satisfied with reasoning from contrariety, as nothing is more evident than that the meaning of a word is known when we know with precision the meaning of its opposite. When we meet, however, with a luckless preposition of which no root is left to be dug up, and which has itself no direct opposite in the language, nothing remains but that we inquire for what purpose it is used by the best writers both ancient and modern; and if we can fix upon one meaning which will apply, however awkwardly, to all the places where it occurs, or to the greater part of them, the probability is, that we have discovered the true and original meaning of the preposition;[2] and by keeping that meaning constantly in view, we shall ourselves be enabled to use the word with perspicuity and precision.

Interjections.

3. *Of Interjections.*

Besides the above parts of speech, there is another acknowledged in all the languages of Europe, called the *interjection;* a word which cannot be comprehended under any of the foregoing classes. The genuine interjections are very few in number, and of very little importance, as they are thrown into a sentence without altering its form either in syntax or in signification. In the words of Mr Horne Tooke, the brutish inarticulate interjection has nothing to do with speech, and is only the miserable refuge of the speechless. The dominion of speech, according to the same author, is erected on the downfall of interjections. Without the artful contrivances of language, mankind would have nothing but interjections with which to communicate orally any of their feelings. "The neighing of a horse, the lowing of a cow, the barking of a dog, the purring of a cat, sneezing, coughing, groaning, shrieking, and every other involuntary convulsion with oral sound, have almost as good a title to be called parts of speech as interjections. In the intercourse of language, interjections are employed only when the suddenness or vehemence of some affection or passion returns men to their natural state, and makes them for a moment forget the use of speech; or when, from some circumstance, the shortness of speech will not permit them to exercise it." The genuine interjection, which is always expressive of some very strong sensation, such as AH! when we feel pain, does not owe its characteristical expression to the arbitrary form of articulation, but derives its whole force from the tone of voice and modification of countenance and gesture. Of consequence, these tones and gestures express the same meaning, without any relation whatever to the articulation they may assume; and are therefore universally understood by all mankind. Voluntary interjections are used in books only for embellishment, and to mark forcibly a strong emotion. But where speech can be employed, they are totally useless, and are always insufficient for the purpose of communicating thought. Dr Beattie ranks *strange*, *prodigious*, *amazing*, *wonderful*, *O dear*, *dear me*, &c. when used alone, and without apparent grammatical syntax, amongst the interjections; but he might with as much propriety have considered *hardly*, *truly*, *really*, and even many Latin verbs, as interjections; for these too are often used alone to supply the place of whole sentences. The truth is, that all men, when suddenly and violently agitated, have a strong tendency to shorten their discourse by employing a single word to express a sentiment. In such cases, the word employed, whether noun, adjective, or verb, would be the principal word of the sentence, if that sentence were completed; and the agitation of the speaker is such, and the cause of it so obvious, that the hearer is in no danger of mistaking the *sense*, and can himself supply the words which are wanting. Thus, if a person, after listening to a romantic narrative, were to exclaim, *strange!* would any man of common sense suppose, that the word *strange*, because uttered alone, had lost the power of an adjective and become an interjection? No, surely; every one sees that the exclamation is equivalent to, "that is *strange*," or "that is a *strange* story." Real interjections are never employed to convey truth of any kind. They are not to be found amongst laws, in books of civil institutions, in history, or in any treatise of useful arts or sciences; but in rhetoric and poetry, in novels, plays, and romances, where in English, so far from giving pathos to the style, they have generally an effect that is disgusting or ridiculous.

---

[1] Junius derives *for* from the Greek προ; Skinner from the Latin *pro;* but I believe, says Mr Horne Tooke, that it is no other than the Gothic substantive FAIRINA, *cause*. He imagines also that *of*, in the Gothic and Anglo-Saxon *af*, is a fragment of the Gothic and Saxon words AFARA and AFORA, *posteritas, proles*. In a word, he considers *for* and *of* as nouns or substantives; the former always meaning *cause*, the latter always meaning *consequence*, *offspring*, *successor*, *follower*, &c. If this account of these words be just, and we have no doubt of it, the prepositions *for* and *of* are in syntax to be considered as nouns in apposition with other nouns, or with sentences taken abstractedly as nouns.

[2] For instance, let us suppose that Mr Horne Tooke's derivation of *for*, from the Gothic substantive FAIRINA, is fanciful and ill founded; yet there can be little doubt but *cause* is its true and original meaning, when it is found, that of sixteen examples brought by Greenwood and forty-six by Johnson, of different significations of the word *for*, there is not one where the noun *cause* may not be substituted instead of the preposition *for;* sometimes indeed awkwardly enough, but always without injury to the sense. Even where *for* seems to be *loco alterius*, which Lowth asserts to be its primary sense, it will be found to be *cause*, and nothing else. Thus, "He made considerable progress in the study of the law before be quitted that profession *for* this of poetry;" that is, "before he quitted that profession, this of poetry" being the *cause* of his quitting it.

Having now analysed every part of speech which can be necessary for the communication of thought, or which is acknowledged in any language with which we are acquainted, we shall dismiss the subject, after annexing an abstract, which may present at one view the several classes and subdivisions of words. Of the different modes of dividing the parts of speech, as well as of the little importance of systematic classifications, we have already declared our decided opinion; but for the sake of those who may think differently from us, we shall in the abstract subjoined adopt Mr Harris's classification as far as it is intelligible; after informing our readers that Mr Horne Tooke admits only three parts of speech, the article, the noun, and the verb, and considers all other words as corruptions or abbreviations of the two last of these.

GRAMMATICAL ABSTRACT,

Exhibiting a Systematic View of Words, as they are commonly arranged into distinct Classes, with the Subdivisions under each Class.

All language is composed of words, each of which may be defined, a sound significant of some idea or relation. These words may be arranged into four general divisions, namely,

I. SUBSTANTIVES; which are all those words that are expressive of things which exist, or are conceived to exist, of themselves, and not as the energies or qualities of any thing else. These may be divided into two orders, viz.

1. Nouns, properly so called, being the names of all those things which exist, or are conceived to exist. These may be divided into three kinds, each of which admits of the subdivisions after mentioned, viz.

Abstract.

Natural, or those which are used as the names of natural substances; such are (genus) *animal*; (species) *man*, *dog*; (individual) *Alexander*, *Cyrus*, *Cerberus*, *Argus*.

Artificial, or the several names of artificial objects; such as, (genus) *edifice*; (species) *house*, *church*; (individual) *Vatican*, *St Peter's*, *St Paul's*.

Abstract, or those which are the names of qualities considered as abstracted from their substances; such as, (genus) *motion*; (species) *flight*, *course*; (individual) the *falcon's flight*, the *greyhound's course*.

Nouns of all kinds admit of the following accidents, viz.

Gender, which is a certain affection of nouns denoting the sex of those substances of which they are the names. For as in nature every object is either male or female, or neither the one nor the other, grammarians, following this idea, have divided the names of beings into three classes. Those which denote males are said to be of the *masculine* gender; those which denote females, of the *feminine* gender; and those which denote neither the one nor the other, of the *neuter* gender. The English is the only language of which the nouns are, with respect to sex, an exact copy of nature.

Number. As there is no object in nature single and alone, and as by far the greater part of nouns are the names of whole classes of objects, it is evident that every such noun ought to have some variation, to denote whether it is one individual of the class which is meant, or more than one. Accordingly we find, that in every language nouns have some method of expressing this. If one be mentioned, the noun is used in that form which is called the *singular* number; if more than one, it is used in a different form, which is called the *plural* number.

Cases. All nouns, excepting proper names, are general terms; but it is often necessary to use those general terms for the purpose of expressing particular ideas. This can be done only by connecting the general term with some word significant of a quality or circumstance peculiar to the individual intended. When that quality or circumstance is not expressed by an adjective, it is in English and most modern languages commonly connected with the noun by the intervention of a preposition; but in the Greek and Latin languages the noun has cases to answer the same, and even in English the noun has, besides the nominative, one case to denote possession.

2. Pronouns, which are a species of word invented to supply the place of nouns in certain circumstances. They are of two kinds, viz.

First, the prepositive; so called because they are capable of leading a sentence. These are divided into three orders, called the pronouns of the

First person. The pronoun of this person, in English *I*, denotes the speaker as characterized by the present act of speaking, in contradistinction to every other character which he may bear. It is said to be of the first person, because there must necessarily be a speaker before there can be a hearer; and the speaker and hearer are the only persons employed in discourse.

Second person. The pronoun of this person, in English *thou*, denotes the person addressed as characterized by the present circumstance of being addressed. It is said to be of the second person, because in discourse there cannot be a hearer till there be a speaker. The pronouns of the first and second persons have number and cases, for the same reason that nouns have these accidents; but in no language have they any variation denoting gender. The reason is, that sex, and all other properties and attributes whatever, excepting those just mentioned as descriptive of the nature of these pronouns, are foreign from

Abstract.

the mind of the speaker when he utters *I* or *thou* in discourse.

Third person. The pronouns of this person, *he, she, it,* are employed to denote any object which may be the subject of discourse different from the speaker and the hearer. They are improperly said to be of any person; for there can be but two persons employed in discourse, the speaker and the party addressed. They are, however, pronouns; since they stand by themselves, and are the substitutes of nouns. *He* is the substitute of a noun denoting a male animal; *she,* of a noun denoting a female animal; and *it,* of a noun denoting an object which has no sex. All these, like the pronouns personal, admit of number and cases; but there is this peculiarity attending them, that though in every case of the singular number the distinction of gender is carefully preserved, in the plural it is totally lost; *they, theirs,* and *them,* being the nominative, possessive, and accusative cases of *he,* of *she,* and of *it.*

Secondly, the subjunctive; so called, because they cannot lead a sentence, but only serve to subjoin a clause to another previously enunciated. Of this kind are

Which and *who.* This subjunctive pronoun may be substituted in the place of any noun whatever, whether it be expressive of a genus, a species, or an individual; as, the animal *which,* the man *who,* Alexander *who,* &c. Nay, it may even become the substitute of the personal pronouns themselves; as when we say, I *who* now write, you *who* now read, thou *who* readest, he *who* wrote, she *who* spoke; where it is observable, that the subjunctive *who* adopts the person of that prepositive pronoun which it represents, and affects the verb accordingly. *Who* and *which,* therefore, are real pronouns, from substitution; and they have this peculiarity besides, that they have not only the power of a pronoun, but also of a connective of the same import with that which in English is expressed by the preposition *of.* The word *that* is now used indifferently for *who* or *which,* as a subjunctive pronoun; but it was originally used only as a definitive, and as such it ought still to be considered in philosophical grammar.

II. ATTRIBUTIVES; which are those words that are expressive of all such things as are conceived to exist, not of themselves, but as the attributes of other things. These are divided into,

1. Verbs, or those words which are expressive of an attribute and an assertion; as, *I wrote.*

The attributes expressed by verbs have their essence in motion or its privation; and as motion is always accompanied by time, therefore verbs are liable to certain variations called tenses, viz.

The *present,* which represents the action of the verb as going on, and as contemporary with something else; as, *I write,* or *I am writing,* either just now, or when you are reading. The *præter-imperfect,* which represents the action of the verb as having been going on but not finished in some portion of past time; as, *I was writing,* no matter when, yesterday, last week, or last year. The *aorist of the past,* which represents the action of the verb as finished in some indefinite portion of past time; as, *I wrote,* or *did write,* yesterday, or last week. The *præter-perfect,* which represents the action of the verb as just *now* finished, or as finished in some portion of time within which the present instant is comprehended; as, *I have written* this day or this week. The *plusquam-perfect,* which represents the action of the verb as having been finished in some portion of time within which a determinate past instant was comprehended; as, *I had written* last week before I saw you. The *first future,* which represents the action of the verb as to be going on at some indefinite future time; as, *I shall write* or *be writing* to-morrow, or next week. The *second future,* which represents the action of the verb as to be completed at some definite future time; as, *I shall have written* when you come to-morrow, next week, next month, or next year.

Abstract.

Affirmation is the essence of every verb, insomuch that all verbs may be resolved into the substantive verb *is,* and another attributive. But a man may affirm something of the action of the verb directly, something of his liberty or capacity to perform that action, or something of his wish that another should perform it. To denote these several kinds of affirmation, all verbs have what grammarians call modes, viz. the *indicative,* to denote the first kind of affirmation; as, *I write:* the *subjunctive,* to denote the second; as, *I may* or *can write:* the *imperative,* to denote the third; as, *write thou,* or *do thou write.* Besides these, grammarians have given to every verb a mode, called the *infinitive;* as, *to write.* But this seems on every account to be improperly styled a mode. Nay, if affirmation be the essence of verb, the infinitive cannot be considered as any part of the verb at all, for it expresses no affirmation. It is indeed nothing more than an abstract noun denoting the simple energy of the verb in conjunction with time.

Verbs have likewise been distinguished into the following kinds, according to the nature of the attribute of which they are expressive, namely, 1*st, Active-transitive,* or those which denote an action that passes from the agent to some external object; as Cæsar *conquered* Pompey: 2*d, Active-intransitive,* or those which express that kind of action which has no effect upon any thing beyond the agent himself; as, Cæsar *walked:* 3*d, Passive,* or those which express not action but passion, whether pleasing or painful; as, Portia *was loved,* Pompey *was conquered:* 4*th, Neuter,* or those which express an attribute that consists neither in action nor in passion; as, Cæsar *stood.*

2. Participles, or those words which are expressive of an attribute combined with time. In English there are only two participles; the present, as *writing,* which expresses the action of the verb *to write,* as going on; and the past, as *written,* which expresses the action of the same verb as finished, and therefore past in time. In Greek and Latin there is a future participle, by which the attribute is represented as being in a state of exertion at some future time; as, *γραψων, scripturus,* about to write.

3. Adjectives, or those words which express as inhering in their substances the several qualities of things, of which the essence consists not in motion or its privation; as, *good, bad, black, white, large, small,* and the like. As attributes are the same whether they belong to males or females, to one object or to many, adjectives ought in strictness to admit of no variation respecting sex or number; and in English they actually admit of none. Some qualities, however, are of such a nature, that one substance may have them in a greater degree than another; and therefore the adjectives denoting these qualities admit in most languages of a variation which grammarians call the degrees of comparison. Thus Plato was *wise,* Socrates was *wiser* than he, but Solomon was *the wisest* of men. There is a species of adjectives derived from nouns, and even from pronouns; for we say, *the Pompeian* party, *a brazen* trumpet, and *my* book, which are phrases equivalent to "the party of Pompey, a trumpet of brass, and the book of me."

4. Adverbs, or those words which, as they denote the attributes of attributes, have been called *attributives of the second order,* to distinguish them from verbs, participles, and adjectives, which denote the attributes of substances, and are therefore called *attributives of the first order.* Adverbs are divided into two kinds, viz.

First, Those which are common to all attributives of the first order, that is, which coalesce equally with verbs, with participles, and with adjectives. These may be divided into adverbs of *intension* and *remission,* or of *quantity continuous;* as *moderately, vastly, exceedingly,* &c. These, like adjectives of a similar nature, admit of the diferent degrees of comparison. Of *quantity discrete ;* as, *nce, twice, thrice,* &c. These are not, in strictness of peech, adverbs, being in reality the possessive cases of ne, two, three, &c. Of *relation ;* as *more, most, less, east, equally, proportionally,* &c.

Second, Those which are confined to verbs properly so alled, and which are of the following kinds: Of *time ;* as, *hen, when, afterward, now,* &c.: of *place ;* as, *here, there, here, hence, whence,* &c.; and also adverbs derived from repositions; as, *upward, downward,* &c.: of *intensions* nd *remissions peculiar to motion ;* as, *speedily, hastily, slow-y,* &c. We have given adverbs a place amongst the parts f speech necessary for the communication of thought; ut it may be doubted whether they be entitled to this istinction. English adverbs at least seem to be nothing ore than corruptions of nouns, adjectives, and verbs.

III. DEFINITIVES; which are all those words that erve to define and ascertain any particular object or ob-ects as separated from others of the same class. These re commonly called Articles, which are divided into vo kinds, viz.

1. Indefinite, as *a* or *an*, which is prefixed to a noun r general term, to denote that but one individual is meant f that genus or species of which the noun is the common ame. This article, however, leaves the individual itself uite indeterminate. Thus, *man* is the general name of e whole human race; *a* man is one individual, but that dividual is unknown. *Any* is prefixed to a noun either the singular or plural number, when it is indifferent as to e truth of the proposition what individual or individuals e supposed; thus, "*any* man will be virtuous when temptation is away." *Some* is prefixed to nouns in the plural umber, to denote that only part of the species or genus is eant, leaving that part undetermined; thus, "*some* men e great cowards."

2. Definite, as *the*, which is prefixed to a noun, to de-ote one individual of the species of which something is redicated that distinguishes it from every other individual. hus, "*the* man that hath not music in himself is fit for easons." It is used before nouns in both numbers, and for e same purpose; for we may say, "*the men* who have not usic in themselves are fit for treasons." *This*, prefixed to noun in the singular number, denotes an individual as resent and near at hand; as, "*this* man beside me." *That*, refixed to a noun in the singular number, denotes an dividual as present but at a little distance; as, "*that* an in the corner."[1]

Besides these, there are many other articles both definite d indefinite.

IV. CONNECTIVES, or those words which are em-oyed to connect other words, and of several distinct arts to make one complete whole. These may be divid-d into two kinds, viz.

1. Conjunctions, by which name are distinguished all ose connectives which are commonly employed to con-in sentences. These have been divided into two kinds, lled *conjunctives*, or those words which conjoin sentences d their meanings also; and *disjunctives*, or those words hich, at the same time that they conjoin sentences, dis-in their meanings. Each of these general divisions has en again subdivided; the former into copulatives and ontinuatives, the latter into simple disjunctives and ad-ersative disjunctives. But the general division is absurd, d the subdivisions are useless. Conjunctions never dis-in the meaning of sentences, nor have any other effect an to combine two or more simple sentences into one compound sentence. If those simple sentences be of opposite meanings before their combination, they will continue so after it, whatever conjunction be employed to unite them. In nature, different truths are connected, if they be connected at all, by different relations; and therefore, when the sentences expressive of those truths are connected in language, it must be by words significant of those natural relations. Thus, accidental addition is expressed by the conjunction *and ;* as when we say, "Lysippus was a statuary, *and* Priscian was a grammarian." The unexpected junction of contrary truths is expressed by *but ;* as, "Brutus was a patriot, *but* Cæsar was not." The relation of an effect to its cause is expressed by *because ;* as, "Rome was enslaved *because* Cæsar was ambitious." The relation of an effect to a cause of which the existence is doubtful, is expressed by *if ;* as, "you will live happily *if* you live honestly:" the relation of a cause to its effect, by *therefore*; as, "Cæsar was ambitious, *therefore* Rome was enslaved." The idea of simple diversity is expressed by *either* and *or ;* "*either* it is day *or* it is night." Contrariety between two affirmations, which, though each may be true by itself, cannot both be true at once, is expressed by *unless ;* as, "Troy will be taken *unless* the Palladium be preserved." Coincidence of two affirmations apparently contrary to each other is expressed by *although ;* as, "Troy will be taken *although* Hector defend it."

2. Prepositions, or those connectives of which the common office is to conjoin words which refuse to coalesce; and this they can do only by signifying those relations by which the things expressed by the united words are connected in nature. The first words of men, like their first ideas, had an immediate reference to sensible objects; and therefore there can be no doubt but that the original use of prepositions was to denote the various relations of body. Afterwards, when men began to discern with their intellect, they took those words which they found already made, prepositions as well as others, and transferred them by metaphor to intellectual conceptions.

Prepositions viewed in this light are

Either *proper*, or those which literally denote the relations subsisting amongst the objects of sense, such as the accidental junction of two things between which there is no necessary connection; as, "a house *with* a party wall." The separation of two things which we should expect to find united; as, "a house *without* a roof, a man *without* hands." The relation subsisting between any thing and that which supports it; as, "the statue stands *upon* a pedestal." The relation of higher and lower; as, "the sun is *above* the hills," "to support uneasy steps *over* the burning marl," "the sun is set *below* the horizon," "the shepherd reclines *under* the shade of a beech tree." The relation between any thing in motion and that in which it moves; as, "the rays of light pass *through* the air." The relation between any thing continued, whether motion or rest, and the point of its beginning; as, "the rays of light proceed *from* the sun," "these figs came *from* Turkey," "that lamp hangs *from* the ceiling." The relation between any thing continued and the point to which it tends; as, "he is going *to* Italy," "he slept *till* morning." The relation between an effect and its cause; as, "I am sick *of* my husband and *for* my gallant."[2]

Or *metaphorical.* For as those who are above others in place have generally the advantage over them, the prepositions which denote the one kind of superiority or inferiority, are likewise employed to denote the other. Thus we say of a king, " he ruled *over* his people ;" and of a soldier, " he served *under* such a general."

---

[1] These two articles have plurals; *these* is the plural of *this*, and *those* the plural of *that.*

[2] Conjunctions and prepositions are indeed employed only to connect sentences and words; but it may be doubted whether they parts of speech distinct from nouns, verbs, and adjectives.

INTERJECTIONS are a species of words which are found perhaps in all languages on earth, but which cannot be included in any of the classes above mentioned ; for they are not subject to the rules or principles of grammar, as they contribute nothing to the communication of thought. They may be called a part of that natural language with which man is endowed, in common with other animals, to express or allay some very strong sensation ; such as, *ah !* when he feels pain. In this view the interjection does not owe its characteristical expression to the arbitrary form of articulation, but to the tone of voice, and the modifications of countenance and of gesture, with which it is uttered ; it is therefore universally understood by all mankind. In discourse interjections are employed only when the suddenness or vehemence of some affection returns men to their natural state, and makes them for a moment forget the use of speech. In books they are thrown into sentences without altering their form either in syntax or in signification ; and in English this is generally done with a very bad effect, though the writer no doubt employs them with a view to pathos or embellishment.

Unwilling to interrupt the continuity of the foregoing article, or to interpolate any additions, however necessary in themselves, which might have the effect of disturbing the logical sequence of the compiler's expositions and illustrations, we have thought it in many respects preferable to annex, under separate heads, such further explanations on several points as may appear to be requisite for their more complete elucidation, and also to supply some defects, particularly on the subjects of the relative pronoun, of comparison, and of the verb, which the learned reader will scarcely fail to detect in this elaborate treatise, notwithstanding its great and acknowledged merits. And,

1. *Of the Relative Pronoun.*

This subject has been pretty fully treated in the preceding article, and the general principles there stated are clearly and correctly unfolded. But whilst these principles are not always pursued to their consequences, and some important views have been omitted, there are also not a few points which seem to require a more ample development, and which may probably be rendered more distinct by a little diversity of illustration. In endeavouring to accomplish these objects, however, we shall freely avail ourselves of the ingenious speculations of one who has done more than any other philologist of this age, or even of the last, excepting perhaps Mr Horne Tooke, to introduce the principles of a sound philosophy into grammatical investigations ; and to ourselves it is a source of no ordinary gratification to think that we are enabled to do so with his own entire consent and approbation, though of course without any responsibility upon his part for errors which may be committed by us in attempting an exposition of his views.[1]

In the learned languages the antecedent is not unfrequently repeated along with the relative. In such expressions as, " Erant omnino *itinera* duo *quibus itineribus* domo exire possent,"[2] " *Urbem quam* statuo vestra est,"[3] "‘ΟΥΣ δ' εν τῳ πολεμῳ ΣΥΜΜΑΧΟΥΣ ἐκτησαμεθα, ἐιϱηνης ὀυσης, ἀπολωλεκασιν αυτοι,"[4] the antecedent is repeated along with the relative, which agrees with it in the same manner as any adjective agrees with its substantive. The relative, therefore, must be an adjective, expressing an attribute of its antecedent, and representing it in some way or other. Again, the application of the relative is universal. There is no object whatsoever to which, in use, the relative may not refer, and which it may not represent. We may say, the animal *which*, the man *who ;* the thing *which*, wisdom *which ;* George *who*, I *who*, thou *who*, he *that ;* and so in innumerable other instances. The attribute expressed by the relative is therefore extremely general, such indeed as may belong to any object whatsoever. The first matter for inquiry, then, is to endeavour to ascertain what the attribute in question really is, or, in other words, to determine the signification of the relative pronoun.

On this branch of the subject, however, it is not necessary to enlarge, after what has already been said respecting it. The analytical solution proposed by Mr Harris, on the authority of Apollonius *De Syntaxi*,[5] namely, into the prepositive pronoun and the conjunction *and*, has already been noticed and refuted. The equation, as stated by him, and also by Dr Beattie, who adopts his view, does not consist of equivalents, either logical or grammatical. The solution is not, therefore, as it ought to be, of universal application. In some instances, indeed, it may appear to have the same effect in a sentence as the copulative conjunction and prepositive pronoun ; but in others, and by far the greater number, it will be found that the effect produced by the substitution of the alleged equivalents is altogether different. Thus, if the sentence, " Light is a body *which* moves with great celerity," be resolved into, " Light is a body, *and it* moves with great celerity," as proposed by Mr Harris, the result is *two* distinct predications respecting light, viz. first, that " it is a body," and, secondly, that " it moves with great celerity ;" whereas, in the original sentence, " Light is a body *which* moves with great celerity," there is but *one* predication made concerning " light," namely, that " it is a body of *great or astonishing velocity.*" It is also to be observed, that the prepositive pronoun in the one sentence, and the relative pronoun in the other, refer to different antecedents. Thus, in the sentence, " The magnet is a stone, *and it* attracts iron," *magnet* is the antecedent to *it ;* but in the sentence, " The magnet is a stone *which* attracts iron," *stone*, and not *magnet*, is the antecedent to *which*. Nor is this all. There are many instances where the resolution proposed, by introducing a double instead of a single predication, would produce either nonsense or falsehood. We can say with perfect truth, that " Legendre was the first mathematician *who* remarked the coincidence of symmetrical magnitudes ;" but if this be converted into " Legendre was the first mathematician, *and he* remarked the coincidence of symmetrical magnitudes," we obtain two propositions, the former of which contains an affirmation erroneous in point of fact. In like manner, if the expression, "Solomon was not the son of David *who* rebelled against his father," be resolved into "Solomon was not the son of David, *and he* rebelled against his father," we have one negative proposition which is historically true, converted into two propositions, the one negative and the other affirmative, but both of them historically false. Mr Harris subjoins as a specious confirmation of his theory, "that the Latins in the structure of the relative seem to have well represented its compound nature, of part pronoun and part connective, in forming their *qui* and *quis* from *que* and *is*, or, as Scaliger would have it, from και and ὁς, και and ὁ:" But, whatever there may be in this, the foregoing examples prove that the relative has often an effect very different indeed from that which is produced by combining a connective with the prepositive pronoun.

[4] Demosth. *Olynth.* B.

[5] From his extensive acquaintance with classical literature, and the philosophical bent of his mind, Mr Harris was certainly a man eminently capable of making important philological discoveries, had he chosen, like Mr Horne Tooke and Dr Hunter, to think boldly for himself, instead of esteeming it a sort of heresy to differ from the opinions of the ancient grammarians. Of these, Apollonius was no doubt one of the most learned and acute, as we shall have occasion afterwards to show ; and in a question of *fact*, his authority is not to be disputed. But the case is very different in regard to a *theory*, the truth or falsehood of which must be established by *evidence*, derived not from the *dicta* of grammarians, but from the principles and usages of language. It is an excessive and misplaced deference to authority, however, which has led Mr Harris to crowd his *Hermes* with a multiplicity of uncouth terms and unnecessary distinctions, which, though they give an air of learned precision to many of his propositions, have an obvious tendency to darken rather than elucidate the subject which he professes to explain.

If, however, the connective (which is nothing but an arbitrary interpolation) be kept out of view, and the relation between the different pronouns be carefully considered, it will, on examination, be found that the relative is merely a particular explanation of the demonstrative pronoun. That the article is really a demonstrative pronoun, cannot be denied by any one who has attentively considered its true nature and import. The common application of ὁ μεν, ὁ δε, and το μεν, το δε, in Greek, renders this sufficiently obvious; and, besides, direct evidence may be produced to establish the fact. In the expression TOI μεν δαιμονες ἐισι,[1] "*illi* quidem sunt dæmones," ὀυτοι might have been used instead of τοι; and again, in the sentence, ΕΙ ΤΟ και ΤΟ ἐποιησεν ἀνθρωπος ὀυτος ὀυκ ἀν ἀπεθανεν,[2] "If this man had done *that* and *that* (such and such things), he would not have been dead," τουτο might have been used instead of το. Nor is this confined to Greek alone. In English also the article is used as a demonstrative pronoun. Thus, when Nathan said unto David, "Thou art *the* man," the expression is the same as if the warning minister of heaven had said, "Thou art *that* man." And the same practice likewise obtains in the Gothic and in the Anglo-Saxon, where, according to Manning, the article put demonstratively has the same signification as *hic, hæc, hoc; is, ea, id; ille, illa, illud.*[3]

Relative Pronoun.

But not only is the article employed as a demonstrative pronoun; in the more ancient Greek writers, particularly in Homer and Herodotus, it is frequently used as a relative pronoun. This has already been shown, and need not be further illustrated by examples, which might be produced in any number required. Θεοι ΤΟΙ Ολυμπον ἐχουσι[4] is manifestly the same as Θεοι ʿΟΙ Ολυμπον ἐχουσι. And, conversely, the relative is sometimes used as an article. "Imo, inquit Vigerus, absolute ʿΟΣ pro ʿΟ nonnunquam usurpatur. ʿΩν (λογου και πλουτου) τῳ μεν ορθως ἀει χρωμενος, αφ᾽ ʿΟΥ δε τοις δεομενοις ἐπαρχων 'quorum altero recte semper utens, altero indigentibus abunde subveniens;' ubi αφ᾽ ʿΟΥ pro απο ΤΟΥ."[5] Anciently the article was used as the relative pronoun in English as well as in Greek. The Lord's Prayer, in its older form, commenced thus: "Our father *the* art in heaven," where *the* is obviously used as a relative pronoun. And the same thing obtains in the Gothic and Anglo-Saxon, in which last, according to Manning, THE put after pronouns of all the persons signifies *qui*, who; as Ic THE, Ego *qui*, I *who*. The same author adds, "Apud Gothos similiter *articulus*, per omnes casus, vicem gerit *pronominis relativi;* ut SA IN HIMINAM, '*qui* in cœlis.'" Again, the demonstrative pronoun *that*, in English, is used indiscriminately with the relative. Thus we say indifferently, "The man *that* endureth to the end," or, "The man *who* endureth to the end;" "The messenger *that* Alexander sent to Darius," or, "The messenger *whom* Alexander sent to Darius;" "The mountain *that* overhangs the lake," or, "The mountain *which* overhangs the lake;" and so universally. Upon the whole, therefore, it may be concluded that the relative is merely a particular application of the demonstrative pronoun; or, in other words, that the *signification* of the relative is radically the same with that of the demonstrative pronoun.

But what, it may be asked, is the precise signification of the demonstrative pronoun? When it is said, "Cæsar Dumnorigem cepit atque interfecit *eum*," it is evident that the *eum* refers to and represents Dumnorix. A question however arises, namely, under what character does it represent him? Cæsar took Dumnorix; but *eum* does not represent him as a prisoner, and there is no other circumstance connected with Dumnorix which the pronoun can suggest to the mind, except the previous mention of his name. From the reason of the thing, therefore, independently of any induction, it may be concluded that *eum* can only be equivalent to the *said* or *before-mentioned;* and, accordingly, it will upon trial be found that, wherever the demonstrative pronoun occurs, some such expression as *said* or *before-mentioned* may be substituted in its stead. And this view is confirmed by the etymology of the demonstrative pronoun in as far as it can be traced either in Greek or in any other language.

For example, the Greek pronoun αὐτος, corresponding to the Latin *ipse* or *idem*, and often to *hic*, appears to be the past participle of the old verb αὐω, *clamo* or *dico*, formed upon the same analogy with the Latin past participle;[6] so

---

[1] Hesiod. [2] Demosthenes. [3] Manning, *Grammat. Anglo-Sax. et Mæso-Goth.* [4] Odyss. Ξ.

[5] But Vigerus, though aware of the fact that ὁς is sometimes used for ὁ, does not seem to have observed that the article ὁ is merely the relative pronoun ὁς, the ancient form of which was τος (whence το, του, τον, την, &c.), with the final ς elided. In Xenophon (*Memorabilia*, cap. 4) we find this expression: Και ʿΟΣ λεξον ἡμιν, ἐφη, τα ὀνοματα αὐτων, where ὁς, though it may be called a pronoun of the third person, is plainly nothing but the article, and where, also, it appears that the demonstrative, used in a particular way, is in reality the relative pronoun.

[6] The universal practice of the Latins in terminating their past participle in TUS, creates a strong presumption that such formerly was also the practice of the Greeks; seeing that, at a remote period, the Latin language was unquestionably a dialect, or, at least, little else than a dialect, of the Greek. And this presumption, joined with the actual existence in Greek of a numerous class of verbal adjectives in ΤΟΣ, having a passive signification, puts it almost beyond a doubt that these verbals in ΤΟΣ are just the old past participles of the verbs to which they respectively belonged. Several of these may indeed have undergone some change of signification, but their consequent or secondary meaning may easily be traced to their primary import, in other words, to that of the past participle. Thus Εραω, *amo*, forms the old past participle ἐρατος, *amatus*, "that *hath* been loved," and consequently "that *may be* loved," or, *amabilis;* Γελαω, *rideo*, forms the past participle γελαστος, *risus*, "that *hath been* laughed at," consequently "that *may be* laughed at," and, by inference, "that is *capable of exciting* laughter," or, in other words, *ridiculus;* and so of the rest. The following examples, selected from many which might be produced, will be sufficient to indicate the analogy upon which these verbals are formed, and to show the propriety of regarding them as the past participles of their respective verbs:

VERBS.		PAST PARTICIPLES.		VERBS.		PAST PARTICIPLES.	
ʿΑγαπαω,	Diligo,	ΑγαπηΤΟΣ,	dilectus.	Δερω,	Excorio,	δαρΤΟΣ,	excoriatus.

that αὐτος, the Greek demonstrative pronoun, is in fact nothing but *dictus* or *said.* Another familiar instance is the use of the word *ditto* in book-keeping; as when it is said "paid *ditto* in full." *Ditto,* as everybody knows, is the Italian *detto,* formed from the Latin *dictus,* in the same manner as *fatto* from *factus, ritto* from *rectus;* and hence the expression, "paid *ditto* in full," is "paid *said* person in full," or, more simply, "paid *him* in full." Again, in our own language, Mr Horne Tooke has satisfactorily traced the pronoun *it,* anciently written *hit,* and still so pronounced in many parts of the country, to the past participle of the Anglo-Saxon verb HAITAN, *dicere, nominare;* whence it follows that *it* or *hit* signifies *said* or *named.*[1] It may, therefore, with some confidence be concluded that *said* was the original import of the demonstrative pronoun; and, as the relative pronoun has been shown to be only a particular application of the demonstrative, the signification of the former must, *ex paritate rationis,* be identical or synonymous with that of the latter, and, consequently, equivalent to *said* or *named.*

In a learned essay, to which Dr Gray's prize was adjudged, on the import and application of the relative pronoun, the author, Mr H. Carmichael, shows that the apparent etymology of this pronoun, in the Gothic language, affords the strongest possible corroboration of the truth of the above conclusion; inasmuch as the Gothic relative is merely, with a slight change of the aspirate into sigma,[2] the past participle of the verb signifying *dicere,* to say. And the admitted connection traceable between the Gothic and the ancient dialects of the Greek language suggests another conjecture, which serves to strengthen the probability of the preceding etymology, and also to confirm the truth of the general proposition above enunciated. The observation of Mr Horne Tooke, that Anglo-Saxon verbs, having I as their characteristic letter, change that letter, in the formation of their past tense, into A broad, is equally applicable to Mæso-Gothic verbs; thus QUIMAN makes QUAM, QUITHAN QUATH, and so on. But as different persons pronounced differently, and also used different written characters as representatives of their sounds, this change of the characteristic letter was exhibited either by A broad, or by O, or by U; and hence it may be inferred from analogy that QUATH would also be pronounced QUOTH, which accordingly is still met with in the colloquial dialect of several districts in Scotland. It would also appear that QUOTH was sometimes pronounced and written QUOD; thus, in Chaucer, "Sir Knight (*quod* he), my maister and my lord." QUOD and QUOTH have therefore been in use. But, in Anglo-Saxon, QUID, *dictum,* frequently occurs; and from the same analogy we may infer that QUITH was also in use at one period. It follows, then, that QUOTH and QUITH are in reality the past tense or past participle of the verb QUITHAN, *dicere.* But as the old form of the Greek relative pronoun was ϰος, different parts of which, as ϰου, ϰη, ϰως, occur frequently in Herodotus, it may not unreasonably be conjectured that the Gothic QUOTH formed the Greek ϰος (the *th* becoming ς in the same manner as δοθι, in the imperative of the second aorist, becomes first δοθ, and then δος), and that QUID formed the Greek ϰις, afterwards written τις, and the Latin *quis.* Further, it has been observed, that in the Mæso-Gothic, SAEI, *qui,* and the article SA corresponding sometimes to the Greek ὁ, and sometimes to οὑτος, bear the strongest appearance of having formed part of a Gothic verb corresponding to the Anglo-Saxon SAEHAN, *dicere;* a circumstance which serves to confirm the truth of the position, that the real signification of the relative pronoun is *said* or *named.*

From this induction, which appears to be conclusive, we now proceed to consider the uses of this pronoun in language, and at the same time to inquire whether, in the different examples produced, the relative corresponds, in effect, to the signification which we have assigned to it. The principal uses of the relative are, *first,* when it renders the clause in which it stands, in some respect or other, descriptive of its antecedent, or, in other words, when the relative is equivalent to an *adjective noun;* and, *secondly,* when it intimates that the amount of the clause to which it is prefixed is to be taken as a *substantive noun.*

1. With regard to the first of these uses; namely, when the relative clause can be expressed by a single term, every one must perceive that it describes or qualifies the antecedent, and is therefore equivalent to an adjective noun. Thus, in the sentence "vir sapit qui pauca loquitur," the relative clause, *qui pauca loquitur,* may be expressed by the term *pauciloquus,* and "vir *pauciloquus* sapit" is therefore exactly the same as "vir sapit *qui pauca loquitur;*" that is, *qui pauca loquitur* is precisely equivalent to *pauciloquus,* or, in other words, the relative clause is equivalent to an adjective noun. But the relative is by no means restricted, in its application, to those cases where the clause which it introduces may be expressed by a single term; on the contrary, the latter may be as long and as complex as the writer or speaker may chuse, although there be no single term in the language expressive of the same combination of ideas. When, for instance, we say, "He is the happy man, who, at any moment of his existence, can reflect on a life which has been spent in the conscientious discharge of his duty;" the clauses, "who can reflect on a life," and "which has been spent in the conscientious discharge of his duty," may not be expressible by single terms; but if they were, these terms would

[1] In legal phraseology *said* is itself used as a demonstrative pronoun; as "*said* city" and "*said* seisin" for "*that* city" and "*that* seisin."

[2] This change, natural in itself, is of frequent occurrence; thus ha*th* becomes ha*s*, see*th* becomes see*s*, doe*th* becomes doe*s*, speake*th* becomes speak*th* and speak*s*, and sende*th* becomes send*th*, send*s*.

universally be denominated adjective nouns. And this leads us to observe that there are two ways by which the relative qualifies the antecedent; the first, when the relative clause is merely descriptive of the antecedent; and the second, when it ascertains to what particular class or species the antecedent belongs. Thus, in the sentence, "The emperors, glorying in nothing but oppression and cruelty, issued many tyrannical edicts, which, as might be expected, fomented discontent and excited rebellion, instead of enforcing submission to their authority;" it must be obvious that the whole of the clause introduced by the relative is equivalent to a compound adjective descriptive of "tyrannical edicts;" and that if the word *said* were substituted instead of *which* (the noun "edicts" being understood), the sense and effect of the sentence would remain unaltered. Again, in the sentence, "homo, qui sapientia caret, nil profuit hominibus," the relative clause *qui sapientia caret*, qualifies *homo* by ascertaining to what particular class or species *this* "homo" belongs. But though, in the former examples, it will readily be allowed that the word *said* may, with perfect propriety, supply the place of the relative pronoun, yet they who have not been accustomed to make the substitution may scruple to admit it in others, or to agree that the sentence "A man, who is destitute of wisdom, is a cipher in society," is exactly equivalent to "A man, said (man) is destitute of wisdom, is a cipher in society." Still the equivalence is undoubted; for the subject of the proposition, "a man," is, in both cases, qualified by words which have precisely the same effect in ascertaining to what class of men he belongs; and although, in the latter case, the relative clause assumes the form of a parenthetical sentence or interjected affirmation, yet if, in pronunciation, the word *said* be slurred over unemphatically, or articulated in the very same manner as the relative *who*, every one must be sensible that these two sentences are, in effect, identical. To prevent the appearance of violence in the substitution, it is necessary to repeat the antecedent along with *said;* but this arises solely from our not being accustomed to use *said* disjoined from its substantive, as we have long been accustomed to use the relative pronoun.

2. The second use of the relative pronoun is, when it intimates that the clause to which it is prefixed is to be regarded as the equation of a substantive noun; as in the sentence, "That you are disappointed, gives me pain," where the clause "that you are disappointed" is evidently the nominative to the verb "gives," and perfectly equivalent to "your *disappointment*." It is true that when the relative occupies this position, grammarians have been accustomed to call it a *conjunction;* but nothing, surely, can be more unphilosophical, or better calculated to produce needless perplexity and destroy the primitive simplicity of language, than to class the same word in different categories of speech according to its position and effect in a sentence. Such a mode of procedure, whilst it is but a clumsy method of screening ignorance, tends to retard a fair investigation into the real meaning of words, by deceitfully substituting a technical name instead of a rational explanation; and it insidiously attempts to wrest from etymology the right of stamping upon terms their genuine signification. In opposition to the commonly received notion, however, it may safely be affirmed that, in all known languages, the neuter of the relative pronoun is prefixed to a nominative and a verb, and that the sentence thus formed is, in amount, equivalent to a *substantive noun.* Thus, when Homer says, Λευσσετε γαρ Τογε παντες Ὁ μοι γερας ἐρχεται αλλῃ, "for you all perceive this at last, *that my prize is going away to another*," Ὁ μοι γερας ἐρχεται αλλῃ is evidently the *object* or *thing* perceived by all; and hence, if this sentence could be expressed by a single term, it would be universally denominated a noun substantive, and would be in the accusative case governed by λευσσετε. The same observations are, *mutatis mutandis*, applicable to the following sentence:

……………………………………………Διομηδης
Γιγνωσκων Ὁ οἱ αὐτος ὑπειρεχε χειρας Ἀπολλων.

where Ὁ οἱ αὐτος ὑπειρεχε χειρας Ἀπολλων is a complete substantive governed in the accusative by γιγνωσκων. Again, ὁτι, the neuter of the relative pronoun ὁστις (compounded of ὁς, *quis*, and τις), is universally employed in the same manner. Thus, in the sentence, Ἀρκει σοι μισθος, ἐφη, τουτο και μονον, ὋΤΙ ἐκ λυκου στοματος και ὀδοντων ἐξηρες καραν σωαν, "even this alone, *that you have taken your head safe and sound out of the mouth of a wolf*, is sufficient reward for you," if ὋΤΙ ἐκ λυκου στοματος και ὀδοντων ἐξηρες καραν σωαν could be represented by a single word, every one would regard it as a substantive noun, and as the nominative to the verb ἀρκει.

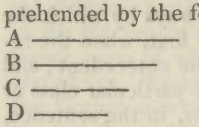
In the Latin language, *quod*, the neuter of the relative, and *ut*, which is just the Greek ὁτι, are used in precisely the same manner. Thus, in the passage, "Hæc nunciantes orabant, *ut* opem ferret, hostemque haud dubium Romanis terra aut maritimis viribus arceret; qui ob nullam aliam causam, nisi *quod* imminerent Italiæ, peterentur:" it is obvious that "*ut* opem ferret" and "*ut* hostem arceret" are compound substantives governed in the accusative by "orabant," and also that "*quod imminerent*" may be considered as a substantive under the regimen of *ob*, and expressed thus: "Qui (scilicet *Oricini*) ob nullam aliam causam, nisi (ob) *imminentiam* Italiæ, peterentur." It is evident, therefore, that *quod*, when thus prefixed to a nominative and a verb, is not a conjunction, but only the neuter of the relative pronoun; that when so used, the sentence is, in amount, equivalent to a substantive noun; that no *real assertion* is intended to be made by the relative clause; and that, on the contrary, the nominative and verb are merely an explanation of the relative which precedes them. In the expression, "I know *that* you are disappointed," *that* enunciates indefinitely the *object* known, and may apply to any object of knowledge whatsoever; but when the clause "you are disappointed" is subjoined, it limits the knowledge to a particular object, namely, *your disappointment.* It hence appears that, in making the words which explain *that* contain a real assertion, Mr Horne Tooke has admitted a fallacy into his ingenious resolution of the relative pronoun when thus employed; for, in such expressions as "I do not assert *that* you are disappointed," or, "I do not believe *that* you are disappointed," it would surely be absurd to maintain that I *assert* your disappointment, when I expressly say that I *do not assert* it, and do not even *believe* it. Upon the whole, then, it seems evident that, in this use of the relative, the pronoun itself is merely a *general enunciative* of the proposition which follows; and that this proposition being the equation of a substantive noun, or an explanation of the pronoun, is to be taken abstractedly, or, in other words, to be considered not as containing a formal assertion, but merely as something said or enunciated.

Comparison.

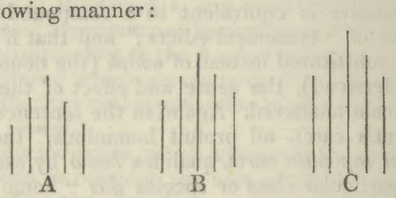
2. *Of Comparison.*

Comparison, *comparatio*, is derived from *comparo*, to put together, a word literally intimating the mode in which one thing is compared with another, namely, by collocation or juxtaposition; and hence, in all languages, this process is expressed in nearly the same manner. The degrees of comparison are commonly said to be three; the positive, comparative, and superlative. But the positive can scarcely be denominated a degree, as it simply states the epithet, and employs no comparison whatever; thus, *albus*, white, *pulcher*, fair. The comparative states a comparison between two objects only; the superlative between more than two. It is impossible, however, to express by different terms, or single words, the gradations or shades of difference which may exist between objects, as, for instance, in colours; and hence necessity obliged the framers of language to invent means by which these various gradations or qualities might be generally expressed. With respect to those words which admit of comparison, two things seem to be necessary; first, that they represent general ideas; and, secondly, that they represent objects which are capable of increase or decrease. In this view even nouns substantive, or generic terms, may be compared. Thus it may be said of a person possessing in an eminent degree those qualities which constitute a hero, that he is *more* a hero than another less liberally endowed in this respect; and, upon the same principle, we find in Greek *βασιλευς*, *βασιλευτερος*, *βασιλευτατος*. But the names of individuals, or, in other words, proper names, do not admit of comparison, because no individual can be another, and consequently no man can be more himself than another. The same observation extends to the personal pronouns, which, although in themselves general, do not admit of comparison, because they are particular in their application. Numbers, too, are the most general of all words; yet, as they do not admit of any addition or diminution, they are not susceptible of comparison; for, if we suppose two sets of any thing, each consisting of six, the one set cannot be *more* six than the other. Verbs, however, may admit of comparison, thus, *amat magis*, he loves *more;* and so also may participles as partaking of the nature of verbs. It is commonly objected, indeed, that the latter then become adjectives; but this is extremely incorrect; for, in such words as *servans, servantior; amans, amantior;* the meaning is not "loving," "more observant of love," but "loving *at present*," "more observant of love *at present*." Adverbs may also be compared; thus, *convenienter, convenientius, convenientissime; eleganter, elegantius, elegantissime.* Prepositions, being a species of adjectives, and oblique cases of nouns, are likewise susceptible of comparison; thus we have in Greek *πρω*, *πρωτατος* now *πρωτος*, and, in English, *before, further, foremost; hind, hindmost.* Interjections, if they be signs significant of ideas or emotions of the mind, may, in like manner, be used in degrees of comparison. The repetition of the same word denotes a comparison, as *alas, alas;* and the expression *ter quaterque beati*, indicates a degree of comparison, perhaps the highest. Among the Hebrews the repetition of the same word, as *good good*, is employed to express the superlative, and hence becomes synonymous with *optimus*, very good or best; and children make use of the same method to express the degrees of comparison. Of conjunctions nothing positive can be said in this respect, as their nature has not yet been satisfactorily ascertained.

But there is a much more refined and less obvious view of the subject of comparison, namely, that the comparative may be recompared, and so also may the superlative; in other words, if language were fitted to express it, there may be an ascending or descending series of successive comparisons of comparatives and superlatives. Without attempting any thing of this sort, however, it may be shown that from one comparative another may be formed, and from one superlative another comparative and superlative, and so on to almost any extent whatever. Suppose three persons, John, James, and Peter: John is tall, James is taller, and Peter is tallest; but, instituting a second comparison, Peter is *more* taller than John than James is; that is, as Peter is the tallest of the three, and as James is taller than John, Peter, with reference to John, the common object, must be taller to a *greater* extent or degree than James, the intermediate subject of comparison, is. But this, which it is difficult to state intelligibly in words, may be better comprehended by the following simple diagram.



Here D is tall, and C is taller than D, but B is *more* taller than D than C is; and of the three, A, B, C, it is obvious that A is *most* the taller than D. In the first case, when we said that B is *more* taller than D than C is, we formed a new comparative of which the former comparative C is the positive; and, in the second case, we formed a new superlative, of which the former comparative was the positive. This may be visibly represented in the following manner:



Here we have three distinct groups or classes of objects, and A, B, and C are each the tallest of its respective class or group; yet these three in their relative excess may again be recompared. Thus B may be *more* the tallest of its group than A is of its group, and of the three, A, B, and C, C may be *most* the tallest of its group. This process, it is obvious, might be carried to any length, and we might form a triple, quadruple, quintuple, sextuple, &c. comparison; nor is there any logical incongruity in the expressions which we have employed, when these are properly applied and understood.

No limit is set to comparison in nature; the only boundary fixed is by our confined faculties. If we were to advance beyond the first, or at most the second step, we would become involved in relations so complicated that it would be impossible to conceive them; and convenience, therefore, obliges us to stop short. In English, we generally express such comparison by circumlocution. Thus, instead of saying that B is *more* greater than D than C is, we commonly say, that B exceeds D more than C does. But instances of the former are sometimes met with even in that language, and not unfrequently in Latin. "The Romans," says Mr Hume, in his *History of England*, "were *more* inferior to the Greeks in eloquence than in military glory;" that is, the Romans were *inferior* to the Greeks both in eloquence and in military glory; but they were *more* inferior in eloquence than they were inferior in military glory. The language of the historian, therefore, is both logically and grammatically correct, though its accuracy has been impeached by persons ignorant of the principle on which the comparison is made. Priscian the grammarian appears to have perfectly understood the *rationale* of such expressions; but Ruddiman, with all his ingenuity and erudition, seems to have been altogether in the dark respecting it, as is evident from the manner in which he speaks, in his *Grammatica Major*, of the instances of double comparisons quoted from Priscian. The resolution of all such examples, however, is, according to the principle here stated, equally certain and obvious. Thus, "Achilles Æneâ *magis* fortior quam justior fuit;" that is, Achilles was *more* braver than Æneas, than he was juster than Æneas; in other words, Achilles *exceeded* Æneas both in bravery and in justice, but he exceeded him *more* in the one (bravery) than in the other (justice). The expression, therefore, is perfectly classical, and consistent with itself. Again, "Ajax est *magis* fortior Ulysse quam Diomede;" that is, Achilles is braver than Ulysses, and he is also braver than Diomede, but he is *more* braver than Ulysses, than he is braver than Diomede, or, in other words, he exceeds Ulysses *more* in bravery than he does Diomede. There is a passage in the historian Florus, a writer of a vigorous imagination, and whose writings accordingly exemplify that characteristic, which, by reason of a double comparison, has been completely misunderstood. It is to be found in lib. iv. c. 46, of his history, and is as follows: "Sed nec *minus* admirabilior fuit illius exitus belli." In none of the editions of Florus is any notice taken of this passage; and upon consulting Clarke's translation it will be found that he has simply rendered *minus admirabilior* "less admirable," just as if it had been *minus admirabilis.* But it is not from the words themselves that we are enabled to make out the passage; it is from the context. Throughout the whole of it there is a train of closely-connected comparisons going on in the mind, and, in particular, three circumstances are mentioned, each having a tendency to create wonder in a greater degree, viz. 1*st*, "Nunquam ullo loco tantum virium populus Romanus vidit," the forces were *more* numerous than at other times; 2*d*, "Nunquam imminentis ruinæ manifestiora prodigia," the presages of impending ruin were *more* striking than at other times; and, 3*d*, "Nunquam *acrior* neque *alacrior* exercitus Cæsaris," the army was *keener*, and evinced *greater alacrity*, than on ordinary occasions. The circumstance, therefore, which led the author to use the expression "Sed nec *minus* admirabilior fuit illius exitus belli," was his having previously mentioned the three things first stated as *more wonderful* than at any other time. There is therefore a double comparison here, *Sed nec* MINUS *admirabilior*, &c. "But no *less* (or, in no less a degree) more wonderful was the issue of this war," viz. *than the issue of other wars.* The three particulars above stated were *more wonderful* than at any other time, and this was *no less* more wonderful. Without the double comparatives the real meaning of the author could not have been expressed. But for the same reason that it was "*minus* admirabilior," it might have been "*magis* admirabilior," *more* more wonderful. *Magis*, however, though used as a comparative, is in truth only a positive of which *major* is the comparative, and *magissimus*, i. e. *maximus*, the superlative; it is derived from the Greek μεγας, and literally signifies *greatly;* thus, "more elegant," was originally "greatly elegant." The comparative, therefore, produces a different effect in language from that which it did originally, when its import was not "more," but "greatly."

The intrepid apostle of the Gentiles, speaking of himself, in one of his epistles, says, ἐμοι τῳ ἐλαχιστοτερῳ παντων των ἁγιων, which is translated "*less than the least*," probably because "*more* the least" would have made but an awkward appearance in English. The superlative here is formed into a new comparative. But the Greek comparative ends in -τερος, which, when fully traced, seems to be ἑτερος, the comparative of εἱς, one, joined to the word denoting the subject or thing compared, and signifies not *more* of one, but *one of two;* for we find the termination -τερος very frequently without any augment or increase of qualities, as πως, πωτερος, which of the two; εἱς, one, ἑτερος, not *more* of one, or *more* of unity, but one of two; ἀλλος, another, αλλοτερος, not *more of another*, but another of two; ὁς, who, ὁτερος, which of the two, in Latin *uterus*, abridged into *uter;* and, in the same manner, καλος, fair, καλοτερος, the fair of the two. We may add, that *whether*, in English, means *which of the two.* Agreeably to this notion, then, the comparative being used as a partitive, *major fratrum* means the elder of the two brothers, or the one selected (on account of *age*) to the exclusion of the other.

Of the termination of the superlative no certain account can be given; it is a part of the subject on which all is conjectural; and although it could be traced, this would be attended with no practical advantage. Its Greek termination is in -τος, and there is some coincidence between this termination and that of the ordinal numbers τριτος, τεταρτος, πεμπτος, &c. which do not mean the aggregate numbers *three, four, five*, but express each an ordinal *unity;* thus τριτος signifies the *third*, and often *one of the three.* The same coincidence between the superlative and the numerals is observable in Latin; thus, *optimus*, &c. *primus*, *quintus*, &c. the *first*, the *fifth*, always denoting *unity*, that is, unity in a numerical series or order. Now, since in these two languages there is such a coincidence between the superlative and the numerals, let us for a moment suppose the superlative to be made up of unity, or to contain in it unity; then *doctissimus Romanorum*, resolved on this assumed principle, will be *doctus unus Romanorum*, "the *one* learned or learned *one* of the Romans," making thus a selection of *one* to the exclusion of *all others. Unus* is taken two ways, either definitely or indefinitely; either as *one only* to the exclusion of all others, or as one of any number. Horace has an example which seems to favour this view, and in which for *unus potes*, *one* that is powerful, we might substitute *potissimus*, the *most* powerful. And Quintilian says, "Demosthenes eminens *unus* in omni genere loquendi est," in which expression *eminens unus* is the equation of *eminentissimus.* The superlative, like *unus*, is used both definitely and indefinitely; definitely when *optimus*, for instance, means *the best;* and indefinitely when it is rendered *very good.* Horace, when inviting Mecænas to a feast, desires him to write back word, "Tu, quotus esse velis, rescribe," where *quot*, combined with unity, signifies "of *how many* you wish to be *one;*" and so perhaps the superlative is composed of unity and the word expressive of that which is susceptible of comparison, namely, the positive.

Lastly, the comparative is often expressed by *quam*, as "Virtus est præstantior *quam* aurum." But *tam* and *quam* correspond to each other as antecedent and relative, and are really such themselves; *tam* being the accusative of the Greek article τον, την, and *quam* the accusative of the relative, and their effect being *tam*, to the degree, *quam*, to which degree. Hence the expression may be resolved, "Virtue is generally excellent to the degree to which gold is," and *more.* According to the idiom of the French language, it would have been "quam aurum *non* est," to which degree gold is *not.* In certain cases of apparent comparison, it is said by many that *potius* and *magis* are understood, as "Res autem admonet cavere *quam* consultare," where it is commonly said that *potius* ought to be supplied; but surely this would be a very violent supplement, and the more natural one, undoubtedly, would be the antecedent of *quam.* Thus, "Res autem admonet *tam* cavere *quam* consultare," "Circumstances warn us to be on our guard *to the degree to which* they warn us to consult" or consider what is best to be done. The import of *than* in English, however, is not so easily ascertained as that of *quam* in Latin. Where *potius* and *magis* are used they seem to be of the same import with the Greek prepositions παρα and προς, and significant of apposition or juxtaposition. *To* in English denotes apposition and likewise comparison. "These blunders are nothing to what we find in Grenada," that is, *compared with* "what we find in Grenada."

Such is an abridged, and, we fear, very imperfect, view of the ingenious and original speculations of Dr Hunter on the subject of comparison; speculations with which all his pupils must be familiar, but which, notwithstanding their extreme refinement, have not hitherto, so far as we know, been submitted to the public, even in an intelligible abstract.

3. *Analytical Resolution of the Moods and Tenses in the Greek and Latin Verbs.*

The subject of the verb, and of verbal forms, has already been treated of at considerable length, but chiefly, as the reader will have perceived, with reference to the English language. It may not be improper therefore to extend the application of the same principles to the resolution of the moods and tenses of the Greek and Latin verbs, and to establish, both analytically and inductively, their universality as laws of human speech, or rather of the human mind adapting language to the expression of its thoughts.

It occurred to Dr Hunter, early in life, that by separating the *time* from the other circumstances involved in those forms of the Latin verb called the tenses of the *indicative* and *subjunctive moods*, the explanations of the tenses, and also of these moods themselves, would be much simplified. The view which then occurred to him he continued to give annually, in his grammatical prelections, during a period of about half a century; and though, without calling in the aid of *other principles*, it is insufficient for the explanation of certain uses of the moods and tenses, yet, as far as it goes, it has contributed to the elucidation of a subject respecting which grammarians had, with a few exceptions, being long accustomed to wander in the dark. Mr Dawes, in his *Miscellanea Critica*, first published in 1745, reached the very verge of Dr Hunter's opinion;[1] and Matthiæ, in his copious grammar of the Greek language,[2] published in 1809, explained some passages of the Greek authors conformably to a general principle found exemplified in the structure of every language. But as he does not seem to have been at all aware of the *principle* itself, and of the *universality* of its application, Dr Hunter was induced, several years ago, to publish an introductory view of the moods and tenses of the Greek and Latin verbs, in which both the principle and its application are most clearly and beautifully unfolded, and which, with his consent and approbation, we are enabled to subjoin. Before entering on the discussion of the particular verbal forms, however, this venerable patriarch of philology premises some general observations connected with the subject, and necessary to a just view of it.

And, *first*, in the polished and refined state in which the Latin language has come down to us, it is perhaps impossible to decompose the various moods and tenses of its verbs, so as to exhibit with certainty the elements, or the *generic verbs*, by the coalescence or combination of which those moods and tenses have been originally formed. The surest, perhaps the only, guide, to which we can have recourse, is furnished by the decomposed state in which these moods and tenses are represented in our own or other modern languages, by means of those generic verbs termed *auxiliary*. Thus, *scripsero*, when decomposed into its simple elements, we represent, by recombining these elements in in this manner, *I shall—have—written.*

Secondly, whosoever, therefore, shall attempt a complete and satisfactory explanation of the moods and tenses of the learned languages, which is still a desideratum in our grammars, must attend particularly to the literal import and meaning of those auxiliary verbs. But even this will not always be sufficient. He will often find that more is meant than meets the ear; and that it is further necessary to call to his aid our modes and habits of thinking, and the inferences which mankind naturally and habitually draw from the verbal statements given. In the expression *I will write*, all that is stated is my *present will, inclination*, or *intention to write.* There is nothing in it *expressive* of a *future action;* yet every person understands it as a declaration, or assertion, of *future writing.* Now, as this is not the amount of the statement literally taken, the effect must be the consequence of an inference drawn from the present volition to the future action. From the *present volition* the *future action* is inferred.

Thirdly, The verbs which our grammarians have termed *auxiliary* are chiefly these: *am, do, have, shall, will, may, can.* One or other of these we employ, or may employ, in rendering literally into English the moods and tenses of the Greek and Latin verb. These verbs, however, when combined with a noun or subject, constitute, each of them, the predicate of a proposition. They all of them express an *assertion*, affirmative or negative, and consequently they are all verbs in the *indicative mood:* as *I am, I am not; I do, I do not; I have, I have not; I shall, I shall not; I will, I will not; I may, I may not; I can, I cannot.* From this view of the subject, some important consequences seem deducible.

1. These auxiliaries, being thus all verbs in the indicative mood, and all of them, when combined with a noun or *subject*, expressing an assertion, it follows that the tenses of the Latin *subjunctive*, or *potential*, or *optative*, as in certain instances it has been called, as well as the *subjunctive* and *optative* of the Greek verb, which involve those auxiliaries, and are literally rendered into English by means of them, are also *indicative.* To consider certain of those forms or tenses as exclusively indicative or assertive, and others as not so, seems to be founded completely in misapprehension, and tends to perplex and mislead. "I *may* write," "I *might* write," are as much assertions, as "I *do* write," and "I *did* write." The thing indicated or asserted is different; but, in as far as assertion is concerned, they are completely similar, and stand upon precisely the same footing.

2. Such expressions as, "I *may* read," "I *may* write," "I *might* read," "I *might* write," "I *may* have read," "I *may* have written," "I *might* have read," "I *might* have written," are incorrectly and improperly considered as *moods*, or *modes*, of *reading* and of *writing.* It is the verb *may* that is *generic*, or the term to be modified, and the other verbs annexed to it contain the modification. The verb *may* predicates *liberty* in general of its nominative or subject; *may read, may write*, predicate liberty *to read* and *to write.* They express not *liberty in general*, but *liberty modified* or particularized. They ought therefore to be considered as modes or moods of the verb *may*, not of the verbs *read* and *write.* The same observations are applicable to all our other auxiliaries. The verb *can* predicates *power* or *ability;* "*can* read," "*can* write," predicate particular power, the power or ability to perform those particular actions; and so of the rest. What has now been said of the English auxiliaries is applicable to the moods and tenses of the learned languages. If the generic verb be prefixed, as it is in our own language, it remains a separate word; and has been termed an *auxiliary* verb. If it be subjoined, or annexed at the end, being unemphatical, it becomes *enclitic;* and, adhering to the verbs to which it is thus annexed, comes at last to be considered as a *flexion*, or *termination.* The French future *J'ai à* or *de porter*, is an instance of the one process, and *Je porter-ai* is an instance of the other. And, in the progress of elision or abbreviation, the auxiliary may be so disguised as to be no longer distinguishable. It may even be doubted if *Je porter-ois* will now be recognised as a compound, or be believed to be the abbreviated form of *Je porter-avois*, "I had to carry." Similar to these last examples appear to be the moods and tenses of the Greek and Latin verb. The auxiliaries, being annexed at the end, have come to adhere to the verbs to which they were annexed, and to be considered as merely changes of termination; and they are with difficulty, if at all, distinguishable as having been separate verbs. Yet the foregoing considerations and examples render it extremely probable that they were originally separate verbs, not prefixed, like the English auxiliaries, but subjoined,

---

[1] See *Miscellanea Critica*, p. 85, Dr Burgess' edition.

[2] Matthiæ's *Greek Grammar*, sect. 522.

and at last attached to and incorporated with the words to which they were subjoined.

But, whatever opinion may be adopted as to the origin and history of these flexions, no doubt whatever can be entertained that they are similar in their nature to our auxiliaries; that the terminations contain the generic part of the expression, and are modified by the radical part of the verbs combined with them. The forms *scrib-am*, *leg-am*, *teg-am*, are therefore improperly considered as *moods*, or *modes*, of the verbs *scribo*, *lego*, *tego*. It is the termination *-am*, the common part, that represents *I may*, or *I can*, and which receives modification from *scrib-*, *leg-*, *teg-*. The general notion of *liberty* or *power* is *modified* by the notion of *writing*, *reading*, and *covering*, with which it is combined; the termination *-am*, by the radical part of the verbs, not the radical part by the termination.

3. As the English auxiliary verbs determine the nature of the *moods* of the learned languages, and, as has already been seen, lead us to conclude, that, by whatever name they may have been distinguished, *subjunctive*, *optative*, or *potential*, they are all equally *indicative* or assertive; so they also, if we listen to their suggestions, will be found equally decisive as to the *tenses* or *times* of those moods. These auxiliaries are all verbs. They are all verbs of the indicative mood; and they are all verbs of the *present* time or tense, each of them having a corresponding form appropriated to *past* time. Thus,

PRES.	*Am*,	*do*,	*have*,	*shall*,	*will*,	*may*,	*can*.
PAST.	*Was*,	*did*,	*had*,	*should*,	*would*,	*might*,	*could*.

The terminations or flexions of the verbs of the learned languages, which contain or involve those auxiliaries, should therefore also be either of the *present* or of the *past time* or *tense*. Whatever they predicate of their subject or nominative, whether *existence*, *action*, *possession*, *duty* or *obligation*, *volition*, *liberty* or *possibility*, *ability* or *power*, they will be found, like the auxiliaries which they involve, to have two corresponding forms, one predicating those attributes of the *present* time, the other of the *past*. If then we separate the *time* from the other circumstances involved in those forms of the Greek and Latin verb called the *moods* and *tenses*, the *time* thus separated, or separately attended to, will, in every one of them, be found to be either the *present* or the *past*. One primary object of these forms seems to have been to give the *present* and the *past* as two *fixed points* of time, with a reference to which all the other ideas involved in them are to be estimated and determined. They are all *past*, *present*, *future*, *contingent*, &c. with reference to one or other of these two fixed points.

These preliminary observations seemed necessary to prepare the way for the proposed elementary view of the tenses of the Latin verb; and in the sequel that view will be further illustrated and confirmed by the application of it to the moods and tenses of the Greek verb. The *tenses* of the Latin verb, arranged as *present* and *past*, are as follow:

		Present.	*Corresponding Past.*		
Indic.	Pres.	*Scribo*,	*Scrib*EBAM,	Indic.	Imperf.
	Perf.	*Scrips*I,	*Scrips*ERAM,		Pluperf.
	Fut.	*Scrib*AM,	*Scrib*EREM,	Subj.	Imperf.
Subj.	Pres.	*Scrib*AM,			
Subj.	Perf.	*Scrips*ERIM,	*Scrips*ISSEM,		Pluperf.
	Fut.	*Scrips*ERO,			

Let us adopt the words *now* and *then*, as short and convenient expressions to indicate the *present* and the *past*. *Scribo*, the *present*, then, represents my *writing* as *now* doing, as *now* in progress; *scrib*EBAM, the corresponding *past*, as *then* doing, *then* in progress. *Scrips*I,[1] the *perfect*, represents it as *now* done, or past; *scrips*ERAM[2] as *then* done or past. *Scrib*AM, whether considered as the future indicative, or as the present subjunctive, represents my writing in the one case as *now* future, as a thing that *is* to be; in the other as a thing that *may* be. Although there may appear to be a marked difference between these two when they are uttered separately, and not combined with another verb, yet, when they are found in combination, as generally happens, the effect of them is in most cases precisely the same. They equally present the verbal state as *future*, and equally present it as *contingent* or *possible*. Thus, *Si jubebis* or *jubeas faciam*, "If you order me, I will do it." Both forms represent my doing it as depending on your ordering me; and both, at the same time, mark the relation of that order to the present time; the one as an event *now* future, the other as an event *now* contingent or possible. *Jubebis*, however, in this combination, leaves it *uncertain* whether you shall order me or not; and *jubeas* leads to the inference, that, if you order me at all, that order is *future*. What the one states as *future*, is at the same time stated by *si* as *uncertain;* what the other states as *uncertain*, is at the same time perceived to be *future*. The two modes of conceiving the event are so blended together, that it is often a matter of indifference whether we employ the one tense or the other; and in numerous instances the present subjunctive may be rendered by *shall*. It is from this affinity or similarity between these two modes of conceiving the action or verbal state, that the terms expressing them often coincide in form. Thus *scrib*AM, *leg*AM, *audi*AM, are, in all our elementary books, set down both as futures of the indicative, and rendered *shall* or *will*, and as presents of the subjunctive, and rendered *may* or *can;* and, whilst *am*EMUS is rendered MAY OR CAN *love*, *scrib*EMUS of the same termination is rendered SHALL OR WILL *write*. It is from the same affinity of signification that both these tenses always unite, in one *past* form, the imperfect of the subjunctive; as *scrib*EREM, which, as the *past time* of the *future indicative*, represents my writing as *then* future; and, as the *past time* of the *present subjunctive*, represents it as *then* contingent or possible, as a thing that might (*may-ed*) be.

There is, in like manner, so great a similarity of meaning in the forms *scrips*ERIM and *scrips*ERO, that, excepting the first person singular, they coincide completely, and always unite in one past form, *scrips*ISSEM. *Scrips*ERIM represents, not my *writing*, but my *having written* (the act of writing being conceived, not as *doing*, but as *done*), as *now* contingent or possible, as a thing that *may* be, or, which amounts to the same thing, it states my *writing* as a thing that *may* HAVE BEEN. *Scrips*ERO states my *having written*, the completion of my writing, as *now* future, or as a thing that *shall* be, or it states my *writing* as a thing that *shall* HAVE BEEN. The former is accordingly rendered by

---

[1] This tense Dr Clarke has, with great correctness of thought, called *præsens perfectum*, the time being really the *present*. There is, however, no incongruity in combining with this form an expression of the *past* time at which the action *was performed;* as, for example, in stating an action as *now* past, and at the same time as having taken place *last year*, or even *last century;* or in stating an event of *last* year as *now* past. The usage of the English language does not admit of combining with the perfect, expressed by *have*, any expression of time that *excludes* the present; at least we do not commonly say, "I *have* written the letter *last week*," but "I *wrote* the letter *last week*."

[2] This form ought to be called *præteritum perfectum*, in conformity with the view on which the tenses have received their denominations, the *time* being really past (*præteritum*), and the action or verbal state represented as then finished (*perfectum*), and not in progress. *Helvetii jam per angustias et fines Sequanorum suas copias* TRANSDUXERANT, *et in Æduorum fines* PERVENERANT, *eorumque agros* POPULARENTUR. (Cæsar *in Bell. Gall.* lib. i. c. 11.) The time of these three verbs is a *past time*, and in this instance they refer to the same point of past time; but the first two express what was *then done* or *past*, the third what was then *doing*.

Mr Ruddiman, I MAY *have written;* the latter, I SHALL *have written.*[1] *Scrip*SISSEM expresses precisely the same conception with the two last, differing from them in no circumstance whatever but the *time*, and expressing the same thing with reference to *past* time which they express with reference to the *present.* It is the *past time* of *scrip*SERIM and *scrip*SERO. It states my *having written* as *then* contingent or possible, I MIGHT (*may-ed*) *have written;* or as *then* future, I SHOULD (*sceoll*-ED, Saxon) *have written.*

Let us apply this view to the various forms in combination with another verb.

And, *first*, of those which have respect to *present* time.

*Quæ imper*AT,
—— *impera*VIT,
—— *impera*BIT,
—— *imper*ET,
—— *impera*VERIT (perf.)
—— *impera*VERIT (fut.)
*se facturos pollice*NTUR.

This set of examples are all presents, each of them containing in itself an expression of present time with reference to which all the other ideas involved in it are to be estimated. "They promise *now*, that they will do

what
he *now* commands;
he *now hath* commanded;
he *shall* command;
he *may* command;
he *may have* commanded;
he *shall have* commanded."

In this combination, *imperat* states the *act of commanding* as *now* present, at the time when they promise; *imperavit* states it as *now* past, *imperabit* as *now* future; *imperet* as *now* contingent or possible, as an event that *may* take place; *imperaverit* (perf.) states the *having commanded* as *now* contingent or possible; *imperaverit* (fut.) states the *having commanded* as *now* future.

It is necessary further to observe, that all these forms contain only the reference or relation of the *command* to the *present* time, and that all of them, excepting the first, leave the *time* of commanding, the time when the command is actually given, completely indefinite. *Imperavit*, for example, merely states the act of commanding as NOW *past*, but leaves the time of giving the command unascertained. The command may have been given last moment, last week, last month, last year, or last century. In the same manner, *imperabit* states the act of commanding as NOW *future.* It expresses barely the relation of the command to the present time, but leaves the time of commanding completely indefinite. It may be next moment, next day, next week, next year, next age. If the *time* of the command be necessary to be ascertained, an expression of future time, or the statement of a future event, with which it shall be contemporaneous, is required for the purpose; as *to-morrow morning*, *next week*, *at sunset*, or *at sunrise*, &c.; or it may be obvious from other circumstances in the context or narrative. In like manner, *imperaverit* states *the having commanded* as an event *now* possible, or *now* future; but of itself it indicates neither the time of giving the command, nor any time or event to which the command shall be prior, or before which it *may* or *shall* have taken place. From the desire, however, which we have to obtain precise rather than vague information, we naturally avail ourselves of the circumstances in the context or in the combination in which it stands, to ascertain what the form itself leaves undefined. In the example given above, *imperaverit* may be considered as standing in a twofold connection, and as having a double reference; one to the present time, the time of the promise (*pollicentur*), with respect to which the act of commanding is stated as *contingent* or *future;* the other to the future time of performing the promise (*facturos*), with respect to which the act of commanding shall be *past.* The whole statement may be fully brought into view by a paraphrastical or periphrastical development, thus: "They promise that they will execute his commands, when the act of commanding, *now* contingent, or *now* future, shall once be past, or when the command *shall* once *have been given.*"

Secondly, Of those tenses which have reference to *past* time.

*Quæ impera*BAT,
—— *impera*VERAT,
—— *imper*ARET,
—— *impera*VISSET,
*se facturos pollice*BANTUR.

This second set of examples are all *past* tenses, each of them containing in itself an expression of *past time*, with reference to which all the other ideas contained in it are to be estimated. "They promised *then*, that they would do

what
he *then* commanded;
he *had then* commanded;
he *should* command;
he *might* command;
he *might have* commanded;
he *should have* commanded."

In this combination *imperabat* exhibits the act of commanding, as THEN *doing*, having the same reference to *past* time that *imperat* (commands) has to the *present;* and therefore may justly be considered as the past time of *imperat. Imperaverat* represents the act of commanding as *then* past, and is therefore the *past* time of *imperavit*, which represents it as *now* past. *Imperaret* represents the act of commanding either as *then* future, or as *then* contingent or possible. In the former case it may be considered as the *past* time of *imperabit: imperabit* stating the act of commanding as *now* future, or future at the present time; *imperaret* as *then* future, future at a *past* time, which in this instance is the time of the promise. They are therefore related to each other as *present* and *past.* On the other hand, if *imperaret* be considered as representing the act of commanding as then contingent or possible, a thing that *might* be, it will be the *past* time of *imperet;* the latter exhibiting the conception in reference to the *present* time, and the former exhibiting the same conception in relation to *past* time. The affinity of signification between the future indicative and the present subjunctive, as formerly observed, is so great, that their terminations often coincide; and hence they always unite in one past form, the imperfect of the subjunctive.

What increases the difficulty of this part of the subject

---

[1] These two, like the present subjunctive and the future indicative, approximate so nearly in signification, that it is often a matter of indifference which of the two be employed.

Si SENSERO hodie quicquam in his te nuptiis
Fallaciæ conari, quo fiant minus;
————te, Dave, in pistrinum *dedam* usque ad necem.
Ea lege atque omine, ut, si te inde EXEMERIM, ego pro te *molam.*
Ter. *And.* I. ii. 25.

In this passage the future and perfect subjunctive may change places without in the least varying the ultimate effect. My perception of your attempting deception is stated as *now* future, but to be *past* or to have taken place when I commit you to the grinding-house; and my releasing you from thence is stated as *now* contingent or possible, and consequently *now* future, but to be past when I *grind* in your stead. My perception is conceived to stand here in a double relation: one to the *present time*, with respect to which it is *future*, and the other to the commitment, with respect to which it is to be *past.* Both events are represented as future with respect to the present time, but the one as past with respect to the other. The same observation is applicable to *exemerim* and *molam.*

Verbs.

s, that we have in English no auxiliary verb so generalized, s, like the terminations of the Latin imperfect subjunctive, o include the particular meanings expressed by *should* and *ight*, so as to be equally applicable to both. Neither does he English idiom always mark the relation of events to ne another in respect of time, as contemporaneous, or rior, or posterior, with the same minuteness as the Latin. This last circumstance also increases the difficulty, and adds o our embarrassment in our inquiries on this subject, as we re apt to consider the different and often more vague statement of the English language as an exact counterpart of hat given by the Latin.

It has already been observed, that the pluperfect subunctive expresses precisely the same conception as the erfect and the future subjunctive, differing from these in o circumstance but that of *time*, and expressing the same hing with reference to *past* time which they express with eference to the *present*. These two ought therefore to be onsidered as *present* forms, and the pluperfect as the corresponding *past* form. *Imperaverit*, for instance, states the aving commanded as *now* contingent or future; *imperavisset* as *then* contingent or future, contingent or future at *past* time; but *of itself* it indicates neither the time of he actual command, nor any time or event to which it was o be prior, or before which it was to have taken place. *Imperavisset*, however, in the connection in which it stands n the example given, is naturally, if not necessarily, conceived to have a double reference; one to the time of the romise (*pollicebantur*), with respect to which the commanding *was* future or contingent; the other to the execution of the command (*facturos*) which it was to precede, nd with respect to which it was to be *past*. "They promised that they would execute his commands, when the ct of commanding, *then* contingent or future, should once e *past*." This clumsy circumlocution is in some degree requisite to bring fully into view what is so concisely and neatly expressed in the Latin.

Such are the views respecting the moods and tenses of the Latin verb which Dr Hunter has unfolded in his invaluable disquisition on that subject, and which, we need scarcely add, are expressed in his own clear and concise language; views which might be illustrated by the usage of every known language, and which, in fact, are based on principles of universal application. In a matter which appears so clear, a wide range of induction was not called for, and might have proved tedious; and hence, in the subsequent part of his disquisition, he has confined himself to some illustrations drawn from the practice of the Greek language.

The indicative forms of the Greek verb, τυπτω, ἐτυπτον, τυψω, τυπῶ, ἐτυψα, ἐτυπον, τετυφα, ἐτετυφειν, &c. seem to require no particular discussion, except whether the aorist in α ought to be considered as a different form of the preterperfect, as a learned professor seems to suspect. The following observations shall therefore be restricted to those forms called the *optative* and *subjunctive*, and are intended to establish and illustrate these two positions:

1. That in all the tenses of the Greek verb (except the *future*, which has no subjunctive), the subjunctive is universally of the *present* time or tense, and the corresponding optative is the corresponding *past* time. And, 2. That the optative of the future is the *past* time of the indicative of the future, which itself is of the *present* time.

We shall begin with the *second* position. In the preceding observations we have endeavoured to show that all the forms of the Latin subjunctive are really *indicative*; that *I may write* is as much an assertion as *I do write*, although the thing asserted be different. It will surely not be controverted, then, that *I will write*, *I shall write*, or *I am to write*, have an equal title to be called *subjunctive* with *I may write*, or *I can write*. Λεγει ὁτι γραψει, "He *says* that he *will* write," is incontrovertibly classical Greek, the expression having a reference to the *present* time. Let λεγει be changed into ἐλεγε the past, γραψει, the indicative, must be changed into the corresponding optative γραψοι. Ελεγεν ὁτι γραψοι, "He *said* that he *would* write." The conception in both examples is exactly the same, except as to time; the *former* expressing it with reference to the *present* time, the *latter* with reference to the *past*. Should any doubt be entertained as to what has now been stated, the following passage from the second book of Xenophon's *Hellenica* will be found to contain as many examples of the optative of the future as may perhaps establish the point by induction. It is part of the defence made by Theramenes, one of the Thirty Tyrants, when he was impeached by Critias, another of them, because he would not concur in all their measures of cruelty and rapine.

. . . . "Επεὶ δὲ οὗτοι ἤρξαντο ἄνδρας καλούς τε καὶ ἀγαθοὺς συλλαμβάνειν, ἐκ τούτου κἀγὼ ἠρξάμην τἀναντία τούτοις γιγνώσκειν· ᾔδΕΙΝ γὰρ ὅτι, ἀποθνήσκοντος μὲν Λέοντος τοῦ Σαλαμινίου, ἀνδρὸς καὶ ὄντος και δοκοῦντος ἱκανοῦ εἶναι, ἀδικοῦντος δ' οὐδὲ ἐν, οἱ ὅμοιοι τούτῳ φοβήσΟΙΝΤΟ· φοβούμενοι δὲ ἐναντίοι τῇδε τῇ πολιτείᾳ ἔσΟΙΝΤΟ· ΕΓΙΓΝΩΣΚΟΝ δὲ ὁτι, ξυλλαμβανομένου Νικηράτου τοῦ Νικίου, καὶ πλουσίου, καὶ οὐδὲν πώποτε δημοτικὸν οὔτε αὐτοῦ οὔτε τοῦ πατρὸς πράξαντος, οἱ τούτῳ ὅμοιοι δυσμενεῖς ὑμῖν γενήσΟΙΝΤΟ· ἀλλὰ μὴν καὶ, Αντιφῶντος ὑφ' ὑμῶν ἀπολλυμένου, ὃς ἐν τῷ πολέμῳ δύο τριήρεις εὐπλεούσας παρείχετο, 'ΗΠΙΣΤΑΜΗΝ ὁτι καὶ οἱ πρόθυμοι τῇ πόλει γεγενημένοι, πάντες ὑπόπτως ὑμῖν ἕξΟΙΕΝ· ἀντεῖπον δὲ καὶ ὅτε τῶν μετοίκων ἕνα ἕκαστον λαβεῖν ἔφασαν χρῆναι· εὔδηλον γὰρ 'ΗΝ, ὅτι, τούτων ἀπολομένων, καὶ οἱ μέτοικοι ἅπαντες πολέμιοι τῇ πολιτείᾳ ἔσΟΙΝΤΟ.

In this passage every one of the indicatives is of the past time, and all the verbs *subjoined* are optatives of the future, "Ηδειν γαρ ὁτι, &c. I *had seen*, and consequently I *knew*, that when Leon of Salamis was put to death, the persons similar to him φοβησοιντο WOULD *be afraid*, and being afraid, ἐσοιντο WOULD *be* hostile to this establishment of ours. I *judged* too (ἐγιγνωσκον δε) that when Niceratus, the son of Nicias, was apprehended, the persons in a similar situation with him WOULD *become* (γενησοιντο) ill-affected to you. And likewise, when Antiphon was put to death by you, who during the war furnished two swift-sailing triremes, I *knew* (ἠπισταμην) that those who had been prompt and eager to serve the state WOULD *be suspicious* of you (ὑποπτως ἑξοιεν). And when they said that each of us must seize one of the μετοικοι, I opposed the measure. For it *was manifest* (εὐδηλον ἠν) that, if these were put to death, all the μετοικοι WOULD *be hostile* (πολεμιοι ἐσοιντο) to the establishment."

Let us now imagine that, instead of this narrative recital of his conduct and sentiments, Theramenes deems it proper to urge the same considerations to his colleagues in the direct or dramatic form. Every one of his statements must now be made by verbs, not of the *past*, but of the *present* time; and the indicatives of the *past* being changed into indicatives of the *present*, the verbs *subjoined* must also be changed from *optatives* of the *future* to *indicatives* of the *future*, that is, from the *past* to the *present*, so as no longer to express what was THEN *future*, but what is NOW *future*. Change ᾔδειν the past into οἶδα the present (I *have seen*, consequently) "I *know* that if Leon of Salamis be put to death, the persons similar to him φοβησονται *will be* afraid, and being afraid ἐσονται *will be* hostile," &c. In like manner, if ἐγιγνωσκον, ἠπισταμην, εὐδηλον ἠν, be changed into γιγνωσκω, ἐπισταμαι, εὐδηλον ἐστιν, the optatives γενησοιντο, ἑξοεν, ἐσοιντο, must also be changed into the corresponding indicatives, γενησονται ἑξουσι, and ἐσονται, which state these events as *now* future. The forms stating the events as *future at a past time*, will necessarily pass into those stating them as *future now* or at the *present time*.

The *first* of the two positions may be illustrated from the same part of Xenophon's narrative, in which he relates in detail the proceedings of the Thirty, and the measures which they adopted to gratify their hatred and establish their power.

"Τούτων δε γενομένων, ὡς ἐξὸν ἤδη ποιεῖν αὐτοῖς ὁ, τι βουλΟΙΝΤΟ, πολλοὺς μὲν ἔχθρας ἕνεκα 'ΑΠΕΚΤΕΙΝΟΝ, πολλοὺς δὲ χρημάτων· ΕΔΟΞΕ δ' αὐτοῖς, ὅπως ἔχΟΙΕΝ καὶ τοῖς φρουροῖς χρήματα διδόναι, καὶ τῶν μετοίκων ἕνα ἕκαστον λαβεῖν, και αὐτοὺς μὲν ἀποκτεῖναι, τὰ δὲ χρήματα αὐτῶν ἀποσημήνασθαι ἐκέλευον δὲ καὶ τὸν Θηραμένην λαβεῖν ὅν τινα βούλΟΙΤΟ· ὁ δ' ἀπεκρίνατο· Ἀλλ' οὐ δοκεῖ μοι, ἔφη, καλὸν εἶναι, φάσκοντας βελτίστους εἶναι ἀδικωτερα τῶν συκοφάντων ποιεῖν· ἐκεῖνοι μὲν γὰρ, παρ' ὧν χρήματα λαμβάνΟΙΕΝ, ζῆν ΕΙ'ΩΝ, ἡμεῖς δὲ 'ΑΠΟΚΤΕΝΟΥΜΕΝ μηδὲν ἀδικοῦντας, ἵνα χρήματα λαμβάνΩΜΕΝ" . . . .

Here the whole texture of the narrative shows that the author is relating *past events*, the verbs being all of the *past* time, ἀπεκτεινον, ἐδοξε, ἐκελευον, &c. The ends proposed to be accomplished should therefore, agreeably to the first position, be subjoined in the *optative.* "There being nothing to prevent their doing whatever they *might choose* (βουλοιντο), they put many to death out of hatred, and many on account of their money. And, that they *might have* (ἐχοιεν) money to give to the guards, they *thought* it proper (ἐδοξε) that each of them should seize one of the μετοικοι,[1] and put them to death; and they *ordered* (ἐκελευον) Theramenes likewise to seize whichever of them he *might choose* (βουλοιτο)," &c.

If the narrative be given in the present tense, the leading verbs will then be ἀποκτεινουσι, δοκει, κελευουσι, and all the optatives subjoined in dependence on them must be changed into the corresponding subjunctives; thus: "There being *now* nothing to prevent their doing whatever they MAY *choose* (ὁ, τι ἀν βουλωνται), they *put to death* (ἀποκτεινουσι) many out of hatred, and many for the sake of their money. And, that they MAY *have* (ἐχωσι) money likewise to give to the guards, they *think* it proper (δοκει αὐτοις) that each of them shall seize one of the μετοικοι and put him to death. And they *order* (κελευουσι) Theramenes likewise to seize whichever of them he MAY *choose* (ὀν, τινα ἀν βουληται).

In giving the reply of Theramenes to this requisition of his colleagues, the author makes a transition from the indirect or *narrative* form, to the direct or *dramatic.* He personates the speaker (Theramenes), and gives the *ipsa verba* supposed to have been spoken by him on the occasion. "It does not appear to me," said he, "to be honourable for those who profess themselves the best men of the state, to act more unjustly than the sycophants. For they (the sycophants) generally suffERED those to live (ἐιων ζην) from whom they MIGHT *receive money* (παρ' ὡν χρηματα λαμβανοιεν); but we are going to put to death (ἡμεις δε ἀποκτενουμεν) persons guilty of no injustice, that we MAY *receive* their money (ἱνα χρηματα λαμβανωμεν)."

This reply of Theramenes deserves to be particularly attended to, on account of the transition from the *past* to the *present* which it contains, and the corresponding transition from the *optative* to the *subjunctive.* Had the author intended to exemplify the first of the above positions, he could not have expressed himself in terms more appropriate, or more completely adapted to the purpose.

From what has been stated, it is easy to perceive why those statements, which, in the direct or dramatic form, are given in the *subjunctive* or in the *future indicative*, are in the indirect form, or narrative recital of them, expressed by the *optative*, precisely in the same manner as in our own language we employ, in direct statements, the present forms *may* and *shall*, and in the narrative recital of those statements the past forms *might* and *should.* Thus, the direct or dramatic statements, "I *may* perhaps go to London next week," and "I *shall* perhaps go to London next week," become in the narrative recital of them, I said that I MIGHT perhaps *go* to London next week," and "I said that I *should* perhaps *go* to London next week." So, when Agamemnon had retired wounded from the field of battle, Hector, in addressing the Trojans and Lycians, employs the subjunctive, a present form:

……………………Ιθὺς ἐλαύνετε μώνυχας ἵππους
Ιφθίμων Δαναῶν, 'ΙΝ' ὑπέρτερον εὖχος ἀρΗΣΘΕ.

"Drive (*now*) your horses straight against the valiant Greeks, that you MAY *bear away* still greater glory." But, when the statement is given in the narrative form, as a past event, the subjunctive ἀρηται is changed into the optative ἀροιτο, the corresponding form of the past time:

Ενθ' αὖ Τυδείδῃ Διομήδει Παλλὰς Αθήνη
ΔΩΚΕ μένος καὶ θάρσος, 'ΙΝ' ἔκδηλος μετα πᾶσιν
Αργείοισι γένΟΙΤΟ, ἰδέ κλέος ἐσθλον ἄρΟΙΤΟ.

"Then Minerva gave strength and courage to Diomede, that he MIGHT (*may-ed*) *become* eminently conspicuous, and MIGHT *bear away* distinguished glory."

It is to be noticed, however, that Homer does not always observe this, the usual and strictly grammatical, sequence of these moods. In the speech of Minerva to Diomede, we find a *past tense* followed by the *subjunctive*, "I *removed* the mist from your eyes that you MAY *distinguish* (ὀφρα γινωσκῃς) a *deity* from a *man* in the field of battle." But, in the indirect form, or narrative recital, of this speech of Minerva, given by Plato,[2] it is ὀφρα γινωσκοι. His words are, "Homer says that Minerva removed the mist from the eyes of Diomede, that he MIGHT *distinguish.*" But even in Homer the expression might have been, ὀφρα γινωσκοις. Ἀφελον ὀφρα γινωσκοις, I removed that you MIGHT *distinguish.* Wherein, it will be said, consists the difference? There is none in the ultimate effect. Γινωσκοις would be used in reference to the time of removal, expressed by ἀφελον, a verb of the *past* time, to which it would correctly correspond. Homer has chosen, however, to change the reference, and to substitute the subjunctive, a form of the present time, thereby marking a reference to the time of Minerva's speaking, not to that of the removal. I (*just now*) *removed* that you *may* (now, or hereafter) *distinguish.* Ἀφελον states the *removing* as *past*, and may be used with equal propriety, whether the removal took place a *moment* or a *century before.* This appears to be a more correct view of the passage than that given by Dawes, who, to preserve a correspondence in the *times*, is obliged to make ἀφελον a preterperfect. Such changes of reference are, we believe, to be found in every language, and they are strikingly frequent in the Greek. A person speaking of himself might say in English, "I *laboured* hard in my youth, that I MAY *enjoy* ease and repose in the evening of life." These changes of reference too are often alternate, as, in historical narrative, a transition is often made from the past to the present time, and from the present to the past.

In the course of this discussion, it has been stated that all the tenses of the subjunctive mood are indicative or assertive. If that observation be admitted to be just, it will supersede the controversy, whether the futures in *-ro* belong to the indicative or the subjunctive mood. It has also been suggested, that what have been considered as the modes or moods of the Latin verb are incorrectly so conceived; that these *flexions* are either generic verbs themselves, or equivalent to generic verbs, indicating *liberty, power*, &c.; and that, instead of modifying the *radical part* of the verbs to which they are annexed, they are really modified by it. It has been shown, that all the tenses, both of the *indicative* and of the *subjunctive* mood, whatever they may further involve, are every one of them either of the *present* or of the *past time;* that they express of themselves one or other of these times, and may be classed in *two* sets, the *one* containing those forms which are of the *present* time, and the *other* those of the *past* time; that the *present* and *past* are two *fixed points,* with reference to which all the other ideas contained in those complex forms, called *moods* or *tenses,* are to be estimated; and that these other ideas are to be estimated as *past, present, future, contingent,* &c. with reference to these two fixed points.

---

[1] It is foreign to the object of these observations to enter on any discussion of the meaning of the word μετοικοι. It seems to mean *domiciliated strangers.*

[2] *In Alcibiad.* II. prope finem. These passages are quoted both by Dawes and by Matthiæ.

This is the elementary view which it was proposed to give of the tenses of the Latin verb. It contains, as far as we are competent to judge, the only ground on which a complete and satisfactory account of these tenses, in all their various occurrences and applications, can be raised as a superstructure; and, if admitted, it will enable us to decide several grammatical controversies; as that, for example, between the acute and bold Sanctius and his learned editor Perizonius, concerning the tenses of the infinitive and the participles, in which the former maintained, that, strictly speaking, *time* or *tense* does not belong to these, and that they are found of *all times.* It is obvious that the infinitive and participles do not, like the definitive forms, contain in themselves the two fixed points of estimation above mentioned; but, on the contrary, that their statements, when they are estimated at all, are to be estimated either from the verb with which they stand connected, or from some circumstance given in the context. They are always estimated from something extraneous, and not, like those of the definitive forms, from any fixed point of time which they themselves express. Thus *scribere* represents the act of writing as *doing* or in progress, but contains in itself no expression of the time *when* doing. The time may be any whatsoever, *past, present,* or *future.* It is generally, but not always, determined by that of the verb with which the infinitive is combined. Thus, in DICO *te scribere,* DIXI *te scribere,* DICAM *te scribere,* the *time* of the writing is determined, not by the infinitive itself, but by that of *dico, dixi,* and *dicam,* the verbs with which it is here combined, and is different in each of these examples. The same observation is equally applicable to the participles, as is manifest from the following examples: VIDEO te *scribentem,* VIDI te *scribentem, cras* VIDEBO te *scribentem.* It has been said above, that the *time* of the infinitive is not always determined by that of the verb with which the infinitive stands combined. DICO *te scribere* may equally signify, *I say that you* WERE THEN *writing,* as that *you* ARE NOW *writing;* and DICO *te scripsisse* may equally signify, *I say that you* HAD THEN *written,* as *I say that you* HAVE NOW *written,* if any circumstance in the context require it to be so understood.

In further illustration of the subject, it has been stated, that through the whole of the Greek verb except the future, the subjunctive and corresponding optative differ only as present and past; consequently, if the subjunctive be rendered by *may,* or *may have,* the optative will be rendered by *might,* or *might have;* and when the subjunctive is rendered by *shall,* or *shall have,* as frequently happens, the optative will be rendered by *should,* or *should have.* It also appears that the future of the Greek verb may be considered as itself subjunctive, and of the present time, and the optative of the future as the corresponding past time.

These views the very learned and ingenious author has sought to establish by *facts;* and if the inductive conclusion appear to be founded on too limited a number of examples, the number of these may be increased by any person *ad libitum.* He proceeds:

The celebrated Matthiæ has attempted to explain the common use of the subjunctive mood, when combined with certain particles of time, by the hypothesis, that it then expresses an *action frequently repeated at the present time.* But meeting in Homer with these words, addressed by Andromache to Hector,

.... οὐ γαρ ἰτ' ἀλλη
Εσται θαλπωρη, ἐπεὶ ἀν συγε ποτμον ἐπισπῃς,

he is obliged to admit, that the subjunctive with these particles does not *always* express an action frequently repeated; and for this good reason, that a person can die but *once.* Yet that learned author does not seem to perceive that this single instance in Homer is fatal to his hypothesis.

Mr Seyer of the university of Oxford, in his work on the syntax of the Latin verb, has assumed, that, in certain cases, the subjunctive is strictly synonymous with the indicative, and has proposed to distinguish it in such cases by the appropriate name of the *False Subjunctive.* Nothing could have been devised more unphilosophical than this proposal, which, had it been successful, and generally adopted, would have effectually dashed all spirit of inquiry, and prevented all further investigation of the subject. Can it for a moment be supposed that an enlightened people, provided with two forms of the verb for the expression of two different and distinct conceptions, should reject the form appropriate to one of them, and employ in preference the other form, which did not correctly and adequately express the conception? If the learned author had seen the following example, of authority that will not be questioned, "I regret that it *should have been found* necessary to add to the burdens of the people,"[1] he might perhaps have been induced to pause a little, and to ask himself whether delicacy of feeling, arising from some peculiarity in the circumstances of the speaker, or in those of the party addressed, or in the occasion, may not have led him to employ the subjunctive form, *should have been found,* in preference to the indicative forms, *has been found,* and *was found.*[2]

---

[1] The Prince Regent's speech in proroguing the Parliament in July 1819.

[2] We subjoin here Dr Hunter's conclusive reply to the objections stated by Professor Dunbar in his work on the Greek and Latin Languages. It is reprinted from the postscript to Dr H's. Disquisition on the Latin and Greek Verbs.

"Mr Dunbar, the learned professor of Greek in the university of Edinburgh, in a work entitled *An Inquiry into the Structure and Affinity of the Greek and Latin Languages* (p. 250), has made some animadversions on one part of the foregoing essay. I subjoin the passage in his own words:—'I must here state that Dr Hunter's ideas respecting the subjunctive mood appear to me not well founded. He has derived his notions of it from the English auxiliary verbs *may, can,* &c. which he says are all *indicative* or *assertive.* This is no doubt true of these verbs when taken by themselves; but when joined with others, they evidently convey the notion of some *condition* or *contingency,* arising either from *ability, inclination, duty,* or *obligation,* in the same manner as those parts of Latin verbs that are subjoined to the tenses of the indicative, and give them a conditional meaning. It is surely not the same thing to say, *I am writing,* and *I may* or *can write.* The one implies the *present act* unconditionally; the other, a *future act,* and conditional. I *may* write *if* I please. I *can write* to him, *if* you wish it,' &c.

"I must observe, that there is nothing in language more subtle than the use of our auxiliary verbs, and of the verbal forms of the Greek and Latin which contain or involve them. They require more depth of thought, and more patient investigation, than yet appears to have been bestowed upon them. I cannot, therefore, at present enter on the subject further than to observe, that, as far as I am competent to judge, the strictures of my learned critic are founded in misapprehension, and completely erroneous. The sen-

4. *On the Analogy observed in the Formation of some Tenses of the Greek Verb.*

Of all the philological speculations of Dr Hunter, one of the most beautiful, perhaps, is that concerning the analogy observed in the formation of some of the tenses of the Greek verb, of which, under the modest title of "Conjectures," he published an outline in the ninth volume of the Transactions of the Royal Society of Edinburgh. The importance of this speculation, which, notwithstanding the heading given to it, is very far indeed from being merely "conjectural," consists in the advance it makes towards establishing juster rules for the formation of the tenses in some instances, and particularly in accounting for certain forms of the verb in Homer and Hesiod, which, being apparent violations of the usual analogy, have perplexed grammarians, and reduced them to the necessity of imagining *new presents*, without authority, and for no other reason but to account for such anomalous forms. The following is the clear and concise statement of his views on this matter, given by Dr Hunter himself.

"1. The perfect middle has not a middle signification. (See Kuster *De Voce Media*, sect. i.) Its form, too, is active; and therefore it probably belongs to the active voice, which, on this supposition, becomes more regular and uniform, having a double preterite, as well as a double future and aorist. Thus,

τυπτω	τυψω	ἐτυψα	τετυφα	1. Pret.
	τυπω	ἐτυπων	τετυπα	2. Pret.

"It is no objection to this account, that the second preterite may sometimes be found in a middle signification; for active verbs in all languages are sometimes used as middle, the reciprocal pronoun being *conceived*, though not *expressed*. Thus μεταβαλλω in Greek, *accingo* in Latin, *prepare* in English: 'omnes accingunt operi,' they all prepare (themselves) for the work.

"2. O in the second preterite, or preterite middle, uniformly arises from ε in the present, and from nothing else.

λεγω, λελογα—βλεπω, βεβλοπα.
λειπω, λελοιπα—πειθω, πεποιθα.

That φθειϱω, μειϱω, ἀγειϱω, and other such verbs having a liquid before ω, make ἐφθοϱα, μεμοϱα, ἠγοϱα, and not μεμοιϱα, ἐφθοιϱα, ἠγοιϱα, is no exception from the rule. For all such verbs probably had of old not ει, but ε only, in the penult. Thus φθειϱω seems to have been of old φθεῤῥω, whence the old or Æolic future φθεϱσω. So μειϱω was μεῤῥω, whence μεϱος, *pars*; and the old or Æolic form ἀγεῤῥω is still to be found. In like manner, βεβολα seems, as Dr Moor has observed, to be formed, not from βαλλω, but from the old verb βελλω, whence βελος, *jaculum*.

"3. Although the first preterite, or perfect active, generally follows the analogy of the first future, yet it sometimes, too, observes that of the second. Thus,

Στελλω makes	not ἐστελκα,	from στελῶ,	1. Fut.
	but ἐσταλκα,	from σταλῶ,	2. Fut.

In the same manner, τεινω, κτεινω, κειϱω, σπειϱω, &c.

"4. On the other hand, although the second preterite, or perfect middle, generally follows the analogy of the second future, yet it sometimes, too, observes that of the first. Thus,

Στελλω makes	not ἐστηλα,	from σταλῶ,	2. Fut.
	but ἐστολα,	from στελῶ,	1. Fut.

In the same manner, τεινω, κτεινω, κειϱω, σπειϱω, &c. Nay, from ε in the penult, there often arises ο in the first preterite, or perfect active. Thus, πεπομφα, λελοχα, κεκλοφα, δεδοικα, from πεμπω, λεγω, κλεπτω, δειδω, &c. And this seems of old to have been still more frequent, and to have extended also to the passive voice. Thus, μεμοϱθαι, πεποϱθαι, in the old or Æolic dialect, from μεῤῥω (*i. e.* μειϱω) and πεϱθω.

"5. In the same manner, although the first aorist generally follows the analogy of the first future, yet it also seems, particularly in the more early periods of the language, to have sometimes followed that of the second future. Thus, χεω, ἐχεα; so ἐιπα, ἠνεγκα or ηνεικα, ἀλευαμενος, ἐκηα, &c.

"Since, then, there are in the Greek verb two futures, and two preterites, each of which preterites follows the analogy of either future, and since there are two aorists, and that the first aorist also follows the analogy of either future; would it not, from these facts, be rather probable than otherwise, that the second aorist should also follow the analogy of either future; that, as from τυπῶ there is formed ἐτυπον, so from τυψω there should be formed ἐτυψον? And,

---

tence, *I may write*, states my *present liberty* to write. It states that there is at present no *external* hindrance to prevent my writing. The words contain a proposition true and complete in itself, without further addition; and my learned critic is obliged to annex to it the conditional clause, *if I please*, to make it suit his purpose; not aware, it should seem, that it is the *actual writing* that is dependent on my pleasure, not the present *liberty* to write. In like manner, *I can write*, states my present *power* or *ability* to write; and this capacity exists independently of your wishes. My *actual writing* may depend on your *wish*, but not my *ability* to write. *I can write* whether you wish it or not. The freedom from external preventive and the inherent power or capacity frequently exist together; but either may exist without the other. 'Εξεστι μοι γϱαφειν, ἀλλ' ὀυ δυναμαι δια την χειϱαγϱαν. There is from without no hindrance to my writing, but I am unable to do it because of the gout in my hand. 'Εξεστι, sed non ἐνεστι; I have the ἐξουσια, but not the δυναμις.

"My learned critic, under a misapprehension for which it is difficult to account, has found fault with my calling the future in *-ro* the future of the subjunctive, imagining, from my employing that designation of it, that I intended to exclude that future from the indicative mood. I must observe, however, that although, to prevent being misunderstood, I was obliged to call the future in *-ro* by the name by which it was generally known, and by which it is distinguished in our elementary books; yet the general tenor of my essay, and even the following paragraph of it alone, ought to have prevented all possibility of misapprehension on the subject: 'In the course of this discussion it has been stated that all the tenses of the subjunctive mood are indicative or assertive. If that observation be admitted to be just, it will supersede the controversy, whether the futures in *-ro* belong to the *indicative* or to the *subjunctive mood*.' P. 14.

"I have stated (p. 4) that 'one primary object of these forms called the *moods* and *tenses* seems to have been to give the *present* and the *past* as two *fixed points* of time, with reference to which all the other ideas involved in them are to be estimated and determined. They are all *past*, *present*, *future*, *contingent*, &c. with reference to one or other of these two fixed points.' And I have there given a scheme of the tenses of the Latin verb arranged, agreeably to that principle, as present and past. This unfortunate future in *-ro*, however, Professor Dunbar has, in exhibiting that scheme, studiously transferred from the class of *presents* to that of *pasts*, and has thereby marred instead of mending the consistency of the scheme of arrangement. For it is quite evident that, as *scrib-am* states my *writ-ing* as NOW future, and therefore, as he admits, is properly arranged as a *present*; so, for the same reason, *scrips-ero*, which states my *having written*, or the *completion of my writing*, as NOW *future*, must also be arranged in the class of *presents*; the *completion* of my writing being *future* relatively not to the *past*, but to the *present* time."

We have only to add, that when Professor Dunbar says, "It is surely not the same thing to say, *I am writing*, and *I may* or *can write*," he not only misunderstands Dr Hunter, but confounds two things not very difficult to distinguish; namely, *assertion* generally, and the thing *asserted* or *indicated* in particular verbal forms. Dr Hunter never said or imagined that, "I am writing," and "I may or can write," are identical propositions. What he really stated, and has always maintained, is, that "I may write," "I might write," are equally *assertions* as "I do write," "I did write." The thing *asserted* or *indicated* is DIFFERENT; but, in as far as *assertion* is concerned, these expressions are completely similar, and stand upon precisely the same footing.

if this were admitted, would it not account for such words as *καταβησεο, ἐδυσετο, λεξεο, ὀρσεο, ὀισε, ὀισετω, ἀξε-τω*, &c. which have so much perplexed the celebrated Dr Clarke (see Notes on *Iliad*, B. 35. E. 109; I. 613), in a manner more satisfactory than is done by the arbitrary method of imagining new presents in -*σω*, from which these forms may be deduced? For it is only to account for such anomalous forms that these new presents have been imagined; and the grammarians would no doubt have assumed imaginary new presents also, to account for such first aorists as *ἐχεα, ἐκηα*, if, by so doing, these aorists could have been reduced to the usual analogy.

" Now this supposition, namely, that the *second aorist*, as well as the first, follows the analogy of either future, which is thus rendered in some degree probable, has actually taken place, at least in some instances. Thus the compounds of *τεμνω*,

{ from the first future *ἀποτεμῶ* has in
ποτεμνω { the second aorist part. *ἀποτεμων*, as well
{ as from the second fut. *ἀποταμῶ, ἀποταμων*.

So *ἰξον*, they came, *Il.* 23, v. 38; *κατεβησετο*, *Il.* 24, v. 191, both of which follow the analogy of the first futures, viz. *ἰξω* (from *ἰκω*, *venio*) and *καταβησομαι*. And every person acquainted with the elements of Greek is aware, that, as *μενω* is the primary form, whence, by the common reduplication, arises, first, *μιμενω*, and then, dropping the short *ε*, by what the grammarians call *syncope*, *μιμνω*, and as *γενω* is the primary form, whence, in like manner, is derived *γιγνω* (Latin *gigno*) and *γιγνομαι*; so *πετω* is the primary form, which, by like reduplication and syncope, gave birth to *πιπτω*, *cado*, from which primary form *πετω*, making in the first future *πεσῶ*, there is formed the second aorist *ἐπεσον*, in common use; which, in so far, both illustrates and confirms the foregoing hypothesis."

These observations were written about thirty years anterior to the date of their publication in the Edinburgh Transactions (1823), and, of course, before either Villoison's or Heyné's editions of the *Iliad* were published. Subsequently to their appearance, Dr Hunter judged it proper to subjoin some facts contained in these two celebrated editions, together with a few observations suggested by these facts, and tending to confirm the opinion which he had been led to form of the anomalous flexions above mentioned of the Greek verb. The additional illustrations, derived from these sources, together with the critical remarks by which they are accompanied, we shall now place before our readers. (See Edinburgh Transactions, *ubi supra.*)

" From the ancient scholia, quoted by Heyné in his observations on the various readings of the *Iliad*, and from the large volume of scholia published by Villoison (as well as from those contained in Barnes's edition of the poems of Homer, published in 1711), it seems to be clearly established, that, in the days of the Ptolemys, this form of the second aorist, following the analogy of the first future, was more frequent in the writings of Homer than that of the first aorist, formed upon the analogy of the same future; and that it was the reading received and approved by the most eminent of the Alexandrian grammarians, by Zenodotus, the keeper of the Alexandrian library, and by Aristarchus himself.

" Whilst, however, the Greek scholiasts have recorded these as the ancient and genuine forms used by Homer, they have, I suspect, greatly erred in their manner of accounting for them. After the lapse of so many centuries, these Homeric forms had, in a great measure, become obsolete,[1] and the other form, that of the first aorist, had come into general use; and those grammarians could devise no other method of accounting for these old and now obsolete forms, but by imagining *new presents* in -*σω*, of which they supposed these forms to be the regular imperfects. This manner of solving the difficulty has been implicitly followed by Eustathius, in his Greek Commentary on the Poems of Homer, and (I am sorry to be obliged to add) by my late invaluable friend Lord Monboddo; of whom, and of the *dies Attici*, now long gone by, in which I enjoyed his learned and elegant society, I never can think but with an indescribable feeling of satisfaction and regret.

" If, however, we acquiesce in this solution of the difficulty, we must be content to abate somewhat of our admiration of the Greek language, which has been heretofore held to express, with the utmost clearness and precision, all the various and diversified conceptions of the human mind, even to their minutest shades of difference. Indeed, that the Greeks, or any enlightened people, should employ those forms of their verbs as *presents*, which were familiar to every ear as appropriate expressions of the *future*, or, as Eustathius often expresses it, should *draw back* the *future* to express the *present*, is, when duly considered, a supposition in itself so unreasonable, not to say absurd, that it would require better and more conclusive evidence to support it, than has yet been produced. Besides, where was the necessity of such an innovation? what advantage was to be gained by it? The original presents remained in common use. Why then employ the *futures*, *δυσομαι* and *ἰξομαι*, for example, as *presents*, when *δυω* and *δυομαι*, and *ἰκω* and *ἰκομαι*, present forms in common use, would answer the same purpose?

" There is still another consideration, to which, in a question like this, due weight ought to be given. There is no evidence whatever that those *present-futures*, or *future-presents*, in -*σω* and -*σομαι*, ever existed. They are not to be found in the poems of Homer or Hesiod. They are not to be found in the Greek authors posterior to Homer and Hesiod; and of Greek authors prior to the age of Homer and Hesiod we know absolutely nothing.

" From these considerations, it seems to be evident that the existence of these *future-presents* is merely a gratuitous assumption of grammarians, to account for the Homeric forms *βησετο, δυσετο*, &c. which they could in no other way reduce to any known analogy of formation.

" *This*, however, the learned Dr Clarke had too much acuteness and good sense to admit; and, accordingly, we find him regarding these presents as altogether *fictitious*. His words on the passage *Ὡς ἀρα φωνησας, ἀπεβησατο*, are these: ' Editi plurimi habent *ἀπεβησετο*, a verbo *ficto ἀποβησομαι*.' And, to obviate the difficulty, he changes *ἀπεβησετο* here into *ἀπεβησατο*; and, when *βησετο*, or any of its compounds, occurs, his general practice is to substitute the form of the first aorist, *βησατο*. But, even if it would remove the difficulty, this change is unauthorized. The other form in -*ετο* is attested as genuine by the Alexandrian grammarians, is supported by the Greek scholiasts, by the ancient manuscripts of the highest authority, and by the early editions. In Villoison's edition of the Iliad, which bears to be an exact transcript of a manuscript of the tenth century, in the library of St Mark at Venice, the form is uniformly -*ετο*, except in a single instance, and in that one instance I suspect -*ατο* to be an error of the press.

" Dr Clarke, however, soon finds that this change of -*ετο* into -*ατο*, violent and unauthorized as it is, will not remove the difficulty. In the address of Diomede to Sthenelus, he meets with the imperative, *καταβησεο*,

---

[1] " One instance, however, of this ancient *Homeric second aorist* occurs in Theocritus, and another in Callimachus; and perhaps by an attentive observer more might be found."

> 'Ορσο, πεπον Καπανηϊαδη, καταβησεο διφρον. *Iliad*, v. 109.

which he attempts to account for in this manner: 'Videtur mihi *imperativus ex futuro deductus*, licet id non agnoscant grammatici; errareque eos, qui verbum hic in præsenti fingunt καταβησομαι. Quanquam, analogia haud dissimili persæpe usurpare visus est Homerus verbum δυσομαι, δυσεο, ἐδυσετο,' &c. Nothing can show more strongly the difficulty which Dr Clarke must have felt in accounting for these forms, than that he is here obliged to have recourse to another gratuitous assumption of an imperative of the future, a thing unheard of before; and almost to admit δυσομαι as a present, from which to deduce ἐδυσετο as an imperfect. The fact is, that he found the authorities in favour of δυσετο and ἐδυσετο to be so numerous, and of such weight, that he did not venture, in these examples, to change -ετο into -ατο.

"Afterwards, however, he found himself obliged to abandon this hypothesis of an imperative of the future, as well as his original position, that these new presents in -σω and -σομαι are imaginary; and he appears at last (he or his son, it is uncertain which) to adopt, in its full extent, the explanation given by Eustathius. That commentator, whose remarks would have been invaluable had his taste and judgment been equal to his means of information, if I rightly understand him, has this observation on v. 154 of the 20th book of the Odyssey: ''Οισετε is sanctioned by a poetic rule of formation (ποιητικῶς κανονιζεται) as the *imperfect* of the verb ὀισω, the *future* having *retrograded* into a *present*. For, of ὀισω, the imperfect is ὀισον, the third person ὀισε, the imperative the same in sound, also ὀισε, of which the plural is ὀισετε.' Dr Clarke or his son adds in continuation: 'Atque analogia quidem haud dissimili sæpe usurpare videtur poeta verba δυσομαι, βησομαι, βησετο, &c. Vide autem ad *Il.* ε. 109' (where, however, he reprobates the hypothesis of these new presents in -σομαι). 'Occurrit eadem vox (viz. ὀισετε) *Il.* γ'. 103, ό. 718, et apud Theocritum, *Idyll.* xxiv. 48. Porro fuerunt, teste Barnesio, qui ὀισατε ubique legendum statuerunt, sed nullo profectu. Nam, uti ipse annotat, occurrit apud Homerum ὀισε in imperativo, numero singulari, ubi isti emendationi locus nullus est, &c. et apud Callimachum, φερε σταχυν, ὀισε θεριсμον. *Hymn. in Cer.* v. 137.'

"All the attempts, however, to account for these forms in particular verbs are partial and unsatisfactory. As the facts to be accounted for are all similar, the true solution must be *general*, and such as will embrace them all. Whether the method which I have ventured to suggest be of this description, does not belong to me to determine. It possesses at least this indispensable requisite, that it accounts for all the phenomena in question.

"It would be tiresome to enter upon a particular examination of every individual verb of the kind which we are considering. It may not be improper, however, to select one example for the purpose of illustration.

"There are not many verbs of more frequent occurrence in Homer than ἱκω, *venio*, in one or other of its parts. It is found in the present:

> Ενθεν (e Cypro) δη νυν δευρο τοδ' 'ΙΚΩ, πηματα πασχων. *Odyss.* ρ'. 444.

and the future, ἵξομαι, occurs once in Hesiod, and ten or twelve times in Homer; and, in not one of these instances, can it by any sophistry be tortured into a *present*, or forced into an expression of *present time*, in the sense in which present time is generally understood. I shall note the places of occurrence, that any person may, if he chuses, examine them, and judge for himself. They are these: *Hesiod. Op. et Dies*, υ. 477. *Il.* α. 240; ζ. 363, 502; λ. 182; ο. 505; ψ. 47; ω. 728. *Od.* δ. 515; θ. 198; κ. 276.

"'Ιξομαι, the future of ἱκω, then, must be decidedly excluded from the catalogue of new presents, devised by the Greek scholiasts to account for the supposed imperfects, so frequent in Homer. And yet a new present, ἵξω, is equally necessary in this, as in any other verb of the kind, to account for ἵξον, *they came*, the past tense, formed upon the analogy of the first future; which, though not noticed either by Dr Clarke or by Heyné, is no less frequent in Homer than the future itself. Thus,

> 'Αλλ' ὁτε δη Τροιην 'ΙΞΟΝ, ποταμω τε ῥεοντε. *Il.* ε. 773.
> *At quando jam Trojam* VENERUNT, *fluviosque labentes.*

See also *Il.* κ. 470; ξ. 433; φ. 1; ω. 692. *Od.* γ. 5, 31, 495; δ. 1; ε. 194. *Hymn. in Apoll.* 411, 438, 230, 278.

"Nor is there a single unequivocal example of the first aorist of this verb to be found in the poems either of Homer or of Hesiod, except one, viz. ἵξας, which occurs in the Hymn to Apollo, υ. 223. In that same hymn, however, there are no fewer than four examples of the form in -ον (ἵξον), and another still in the Hymn to Mercury, υ. 398.

"This instance of ἵξον, so frequent in Homer, may therefore be fairly admitted to be, in the language of the celebrated Bacon, an *instantia crucis*, clearly pointing out the true method of accounting for all the other Homeric forms of the same description. If so, there will no longer be any necessity for the gratuitous assumption of new presents in -σω and -σομαι, to account for these forms; nor for supposing, with Dr Clarke, that καταβησεο is an imperative of the *future;* nor for changing, as he has generally done, the second aorists βησετο, καταβησετο, &c. into regular first aorists in -ατο. We ought rather to restore the Homeric second aorists in -ετο, recognised as the genuine readings by the grammarians of Alexandria, and the Greek scholiasts, and confirmed by the ancient manuscripts of highest authority, and the early editions.

"If the view which I have ventured to give of these Homeric forms in -ετο be well founded, it will hardly be necessary to notice the canon of criticism attempted to be established by the learned Heyné, in his voluminous edition of the *Iliad*, as to -ετο and -ατο, and the reasons for preferring the one to the other in particular passages. Of the futility of that attempt every classical scholar who will read with sufficient attention the last seventeen verses of the third book of the Odyssey, will be fully convinced. The learned German has adopted, without scruple or hesitation, the explanation of these Homeric forms given by the Greek scholiasts; and, in allusion, I presume, to the difficulty felt by Dr Clarke, in admitting the existence of new presents in -σω and -σομαι, he states his opinion, and the grounds of it, with decisive confidence, in the following words: "Esse autem talem formam præsentis βησομαι *dubitari nequit; nam* est v. e. Θ. 105. Αλλ' ἀγ', ἐμων ὀχεων ἐπιβησΕΟ,' p. 506, v. 4. And on B. v. 35, he makes the following remark, not quite consistent with itself: 'Quid hoc loco intersit, non video; nisi quod ἀπεβησετο *antiquioris vocis* speciem habet: *nova forma* subnata, ut δυσομαι, ἐδυσομην, et alia.' How the *nova forma* should have *antiquioris vocis speciem*, I do not clearly comprehend. But a gleam of truth will sometimes burst through the darkness of inveterate prejudice."

These views, which to most persons will probably appear to carry their own evidence along with them, have, however, had the misfortune to incur the disapprobation and censure of Professor Dunbar, who, in his very meritorious work on the Greek and Latin languages (p. 188, *et seqq.* Edinburgh, 1827, in 8vo), has treated "one of the most acute scholars and grammarians of the present day" (these are his own words) with far less consideration than might have been expected from such an admission, and who contradicts speculations which it is impossible to refute, in a peremptory tone, neither called for by the subject itself, nor much in keeping with the courtesy

Verbs.

that usually obtains amongst men of letters. It may not be improper or unnecessary, therefore, to show, by a few examples, that the critical strictures of Professor Dunbar are as deficient in point of accuracy, as his mode of expressing himself is, we are sorry to say, wanting in that respect which is due to the venerable age and to the great attainments of "the most acute scholar and grammarian" of his time.

1. After citing the greater part of the fifth paragraph of the first quotation above introduced, Mr Dunbar observes, "Dr Hunter then gives as an example the compound verb ἀποτεμνω, from the first future of which, says he, comes the second aorist participle ἀποτεμων, as well as from the second future ἀποταμω, ἀποταμων. *Where Dr Hunter found the second aorist participle* ἀποτεμων, *I do not know, as I never observed it;* the other form, ἀποταμων, occurs often in the Greek authors." Now, it will not be very difficult to show where Dr Hunter found ἀποτεμων, or at least sufficient authority for employing it, and where Mr Dunbar might have made the discovery. In the *Cyropædia* of Xenophon (lib. v. c. 2, l. 29), there is the following passage:—'Αλλα τους μεν ἀσθενοῦντας ὁια ὑβριζει, τι δεῖ λεγειν; ἑνος δε ἀνδρος πολυ δυνατωτερου, ἢ ἐγω, ὑιον και ἐκεινου ἑταιρον ὀντα, ὡσπερ τον ἐμον, συμπινοντα παρ' ἑαυτῳ συλλαβων ΕΞΕΤΕΜΕΝ, ὡς μεν τινες εφασαν, κ. τ. λ. For a reason which will be obvious to every scholar, we abstain from translating this passage, in which Gobryas describes the treatment to which a certain ancient lover of surgery was in the habit of subjecting some of his boon companions. But as we have here ἐξετεμε, the participle of which is ἐξετεμων, it is difficult to conceive why Mr Dunbar should proscribe ἀποτεμε, or at least ἀποτεμων, which only differs from the word employed by Xenophon in having the preposition ἀπο instead of the preposition ἐκ or ἐξ prefixed to it. 'Αποτεμειν means *to cut away* or *cut off;* ἐξετεμειν signifies *to cut out*, or, in other words, indicates a somewhat more radical and complete form of the operation. If it be good Greek to use such a form of the verb as ἐξετεμειν, it can scarcely, we should imagine, be bad Greek to employ ἀποτεμειν, the same verb, in the same tense, varied only in its sense by the preposition prefixed.

2. "I am, however, *decidedly* of opinion," continues Mr Dunbar, "that no first aorist was ever formed from a second future; and in the examples which the doctor has given, *he has assumed what never existed*." Here again the learned professor cuts a little before the point; for the "assumption" on which Dr Hunter has grounded his ingenious solution of these apparent anomalies, so far from being gratuitous and unauthorized, as Mr Dunbar asserts, is distinctly countenanced by Apollonius of Alexandria, whom Priscian calls *summus auctor artis grammaticæ*, and Mr Harris, in his *Hermes*, describes as "the most acute author that ever wrote on grammar." In his treatise *De Syntaxi* (lib. i. c. 36, p. 76), this learned and acute grammarian, speaking of imperatives, says,

"Quid est igitur cur non ridiculi existimentur, qui negant esse verba imperativa futuri temporis, cum omnia cogantur ad futuri sensum? nam ea imperamus, quæ aut non fiunt, aut non facta sunt. Quæ autem non fiunt, aut non facta sunt, et tamen ut fiant apta nata sunt, ea futuri temporis sunt: siquidem et ea quæ imperata non fiunt, enunciantur cum negante particula, et sensu futuri; ὀυ δυνησομαι, ὀυ ποιησω. Nam etsi dicimus etiam illo modo ὀυ δυναμαι βαστασαι idem tamen valet atque ὀυ δονησομαι. Ergo ex futuri sensu imperamus ut fiat aliquid, aut non fiat, addita negante particula; imperfecte quidem, ut σκαπτετω τας ἀμπελους; perfecte vero, ut σκαψατω τας ἀμπελους. *Quid autem decepit eos qui admiserunt futuri imperativa?* Γραψετω tantum, et ὀισε θεειον γρηϋ; quæ quanquam absolutius a nobis in libro *De Imperativis* diluuntur, tamen quia locus etiam hic idem exigit, pauca quædam adjungemus. Nimirum illud γραψετω et ὀισε poetica licentia per enallagen fuisse usurpata pro voce γραψατω et φερε; *non diverso tempore, sed dilectu verbi*, quod, utra voce velis, *recte profertur:* quemadmodum in indicativo modo quæstio ejusmodi ante orta est; in ἐγραψας, inquam, vel ἐγραψες, quandoquidem in istis *nullum temporis discrimen est*, sed tantum *in scriptura;* quæ assumi potest *non sine ratione probabili*, sicut demonstramus in capite *De Verbis*."[1]

From what is here stated by Apollonius, particularly if it be taken in connection with other parts of his work, to which reference is expressly made by him, and in which his views are more fully explained, it appears that, according to this learned grammarian, the circumstance which has misled those who admit imperatives of the future is the occurrence of such forms as γραψετω and ὀισε; that γραψετω and ὀισε, though used, *poetica licentia per enallagen*, for γραψατω and φερε, are not to be considered as thereby undergoing any change in point of *time*, but merely as variations in the form of expression, and perfectly equivalent in their effect (*non diverso tempore, sed dilectu verbi, quod, utraque voce velis, recte profertur*); that, in short, between γραψετω and γραψατω, ἐγραψες and ἐγραψας, there is no difference whatever in point of *time* (*nullum discrimen temporis*), but only in the writing; and that those verbal forms which Mr Dunbar has arbitrarily denominated imperfects, are truly aorists in the strictest acceptation of the term. With regard to the *ratio probabilis* here alluded to as explained in the chapter on Verbs, though it is not very clearly developed by the Alexandrian grammarian, it seems, in effect, to be nearly the same with the principle so distinctly brought out by Dr Hunter; namely, that the second aorist, as well as the first, follows the analogy of either future, and that, in some instances at least, second aorists have been formed upon the analogy of the first future, as stated by Dr Hunter. Mr Dunbar, however, is "decidedly of opinion" that no second aorist was ever formed from the first future, and conversely; in other words, he is at issue with Apollonius, who states facts to the contrary, as well as with Dr Hunter, who unfolds the only principle on which these facts can be accounted for, consistently with the genius and idiom of the Greek language.

3. Professor Dunbar proceeds thus: "The whole *mistake* has arisen from not considering, or *not knowing*, the genuine form of the second future. But, says Dr Hunter, how are we to account for such forms as καταβησεο, ἐδυσετο, ορσεο, ὀισε, ἰξον, and some others, if these are not to be considered as second aorists derived from first futures; because no person can show that the futures of

---

[1] To prevent mistakes, and obviate cavils, we shall subjoin the original of the passage translated from Apollonius: "Πῶς οὖν οὐ γελοῖοι εἰσιν οἱ [μη] ὑπολαβοντες ῥηματα προστακτικα μελλοντος χρονου, ὅπου γε παντα συνωθεῖται εἰς την τοῦ μελλοντος ἐννοιαν; ἐπι γαρ μη γινομενοις ἢ μη γεγονοσιν ἡ προσταξις· τα δε μη γινομενα ἢ μη γεγονοτα, ἐπιτηδειοτητα δε ἔχοντα εἰς το ἔσεσθαι, μελλοντος ἐστιν, εἴ γε και τῶν προσταχθεντων τα μη γινομενα λογον ἔχει μετα ἀποφασεως και τῆς τοῦ μελλοντος ἐννοιας, οὐ δυνησομαι, οὐ ποιησω. κἀν γαρ οὕτω φαμεν, οὐ δυναμαι βασταισαι, ἐν ἴσῳ ἐστι τῷ οὐ δυνησομαι. εἰς το γινεσθαι οὖν ἢ γενεσθαι ἡ προσταξις γινεται, ἀποφασκομενη ἀπο τῆς τοῦ μελλοντος ἐννοιας, εἰς μεν παρατασιν, σκαπτετω τας ἀμπελους, εἰς δε συντελειωσιν, σκαψατω τας ἀμπελους. Τι δε το παραξαν τους παραδεξαμενους μελλοντος προστακτικα; Μονον το γραψετω και το οἶσε θειον γρηϋ, ἅπερ ἀπολυεται ἐντελεστερον ἐν τῷ περι προστακτικῶν, ἀπαιτοῦντος δε και νῦν τοῦ λογου ὀλιγα παραθησομεθα, ὅτι ποιητικωτερον μεν το οἶσε κατ' ἐναλλαγην εἴρηται φωνῆς τῆς φερε, τῆς γραψετω και τα ὅμοια, οὐ κατα διαφορον μεν χρονον, κατα δε ἐκλογην ὀνοματος, ὁποτερον εἰη κατωρθωμενον, καθαπερ ἤδη προεμελετηθη τοιαυτη ζητησις ἐν τῇ ὁριστικῇ ἐγκλισει, ἔγραψας ἢ ἔγραψες, οὐ διαφορᾶς οὔσης χρονικῆς, αὐτο δε μονου γραφῆς, δυναμενης οὐκ ἀπιθανως παραλαμβανεσθαι, ὡς ἐπιδεικνυμεν ἐν τῷ περι ῥηματων." (Apollonii Alexandrini *De Constructione Orationis*, lib. iv. ex recens. Immanuelis Bekkeri, p. 70, 71, Berlin, 1817, in 8vo.)

such verbs were ever employed as presents? I hope to be able to prove, both from *examples and analogy*, that the old established opinion, viz. that the futures of certain verbs, whose original presents had become obsolete, were sometimes used as presents, and that those forms which the doctor supposes to be second aorists, were imperfects, *used, however, as aorists*, i.e. *with indefinite time*." We shall have occasion immediately to examine some of the "examples" and "analogies" by means of which the learned professor labours to establish his position. It will be sufficient here to advert to the confusion of ideas which reigns in the passage we have just cited. How, says Dr Hunter, can you account for such forms as *καταβησεο, ἐδυσετο, ὀρσεο, ὀισε, ἶξον*, and the like, if they are not to be considered as second aorists formed on the analogy of the first futures of the verbs to which they belong? Perfectly, responds Mr Dunbar; they are neither first nor second aorists (Apollonius, as we have just seen, thought otherwise), but only *imperfects*, "used, however, *as aorists*," and performing all the functions of these particular verbal forms; that is, they are *not* aorists, but imperfects, which imperfects, however, *are in reality* aorists. Nor is even this all. The learned professor, misled apparently by the literal meaning of the term, is betrayed into an entire misconception in regard to the *time* indicated by the aorist, which he considers as "indefinite." He could not easily have committed a greater mistake, as has already been shown in treating of the verb. The *time* of the aorist, strictly considered, is *absolute past*, and if it ever *appear* to be "indefinite," as it unquestionably in some instances does, that arises, not from any vagueness or uncertainty in the tense itself, but from an *inference* drawn by the mind from those particular predications which it is employed to express. Thus, *ὀλιγος χρονος τας των φαυλων συνηθειας διελυσε*, "A short time *dissolved* (or *did dissolve*) the associations of bad men." This is all that the words actually express. But, as we know from experience that the laws of nature, moral as well as physical, are uniform, we *infer* that what occurred *formerly*, happens *now*, and will take place *hereafter*; and hence, by an easy and gradual coalition of the secondary inference with the primary and invariable signification of the verb, we come at length to say that "a short time *always dissolves* the associations of the wicked." The expression in Scripture, *Ὁυτος ἐστι ὁ ὑιος μου ἀγαπητος ἐν ᾡ ἐυδοκησα*, rightly translated in our version, "This is my beloved Son, in whom I am *always well pleased*," and all others of a similar description, are to be resolved and explained upon precisely the same principle.

4. In rejecting Dr Hunter's solution, which proceeds upon ascertained and determinate *data*, Professor Dunbar adopts one which he admits to be *purely imaginary*. "I believe," says he, "the present of *ὀισω is nowhere to be found in the language*, because it must have been the same in appearance and sound as *οἰω, puto: φερω* is commonly used instead of it. But Pindar, in his fourth Pythian Ode (v. 181), employs *οἰσειν as a present*.

> ……………………φαμι διδασκαλιαν
> Χειρωνος οἰσειν. ἀντροθε γαρ νεομαι
> Παρ Χαρικλοῖς.

I say that I obtain instruction from Chiron," &c. In this passage Professor Dunbar appears to have committed several mistakes. Without adverting to his contradictory expressions in regard to *οἰσω*, we may observe, in the first place, that if Pindar had really employed *οἰσειν* here "as a present," the language which he puts into the mouth of Jason would, upon that supposition, have conveyed a statement contrary to the fact. Jason, it is true, was educated by Chiron; but long before the period referred to in this passage, his education had been *concluded;* and there is nothing said to warrant the assumption that, on his return from the Argonautic expedition, which is celebrated in this ode, he had resumed his studies under the Centaur, and was, at the time of speaking, actually "obtaining" or receiving "instruction from Chiron." He had no doubt, according to his own statement, been to visit that famous personage; but his object, as we shall presently show, was not for the purpose of being taught, instructed, or educated by Chiron (*that* had been accomplished long before), but to obtain *information* from the Centaur to enable him to make good his claims, which, it seems, had been disputed. Adjured to speak the truth, Jason accordingly says, "I *will relate* what I have learned (*διδασκαλιαν*) from Chiron; for I have just come from the cave near Chariclo and Philyræ;" and, in conformity with this declaration, he proceeds to state the substance of the *information* he had obtained from the Centaur respecting his rights. In what follows there is not a word said respecting "instruction" or education. The narrative of Jason relates to a subject of more immediate interest to him, one indeed in regard to which he had engaged that he would *produce* (*ὀισειν*) *what he had learned* (*διδασκαλιαν*) *from Chiron* during the visit to his cave, and tell nothing except on the authority of his old master, or in accordance with the *information* which he had received from him. In our view, therefore, the common interpretation of this passage, *Institutus sum a Chirone*, is erroneous, notwithstanding it has been adopted by so distinguished a scholar as Heyné, who conceives *διδασκαλιαν Χειρωνος οἰσειν* equivalent to *διδαχθῆναι παρα Χειρωνος*. But, however this may be, it is evident from the words here quoted, that the celebrated German scholar does not consider *ὀισειν* "as a present" tense; and that, whether our interpretation of the passage be right or wrong, Heyné, in adopting the ordinary one, has distinctly corroborated the view which we have taken of *ὀισειν*.

But, not to dwell longer on this, other examples of the nature of *instantiæ crucis* may be produced to disprove Mr Dunbar's assertion that *οἰσει* is used "as a present." In the ninth Pythian Ode of Pindar (l. 104) we meet with the following passage:—

> Τυθι παῖδα τεξεται, ὁν κλυτος, Ἑρμᾶς
> Ἐυθρονιοις Ὡραισι και Γαιᾳ, ἀνελων
> Φιλας ὑπο ματερος, ᾿ΟΙΣΕΙ.

In this sentence, if *ὀισει* be a *present*, as Mr Dunbar contends, how is its *time* to be reconciled with that of *τεξεται*? If the learned professor be right, Pindar has, in this case at least, been guilty of a gross anachronism. Again, in the seventh book of the Iliad (l. 81), Hector says,

> Ἐιδε κ' ἐγω τον ἑλω, δῳη δε μοι ἐῦχος Ἀπολλων,
> Τευχεα συλησας, ᾿ΟΙΣΩ ποτι Ἰλιον ἱρην,
> Και κρεμοω ποτι νηον Ἀπολλωνος ἑκατοιο.

"Sin ego illum *interfecero*, dederitque mihi gloriam Apollo, arma detracta FERAM ad Ilium sacrum, et *suspendam* ad templum Apollinis longe jaculantis:" "But if I shall be fortunate enough to slay him, and Apollo give me the glory of such a victory, *then*, having stripped him of his arms, *I will carry* them to sacred Ilium, and will hang them up at the temple of the far-darting Apollo." By no sophistry can the verb *οἰσω* in this passage be tortured into a present; and the same observation equally applies to *οἰσει* in the foregoing extract from Pindar. But if *οἰσω* be a first future, as it undoubtedly is, can it for a moment be doubted that *οἰσε* is an aorist formed upon the analogy of that future; and if so, is it not clear that, in some instances at least, the second aorist follows the analogy of the first future?

(A.)

GRAMMARIAN, one who is skilled in or teaches grammar. Anciently the name grammarian was a title of honour in literature and erudition, being given to persons accounted learned in any art or faculty whatsoever. But it is otherwise now, being frequently used as a term of reproach, to signify a dry plodding person, employed about words and phrases, but inattentive to the true beauties of expression, and also to delicacy of sentiment. The ancient grammarians, called also philologers, must not, however, be confounded with grammatists, whose sole business was to teach children the first elements of language. Varro, Cicero, Messala, and even Julius Cæsar, thought it no dishonour to be ranked as grammarians, who in fact had many privileges granted to them by the Roman emperors.

GRAMPIANS, a mountain chain in Scotland, so called from two Celtic terms, *grans* and *bein*, signifying "rugged mountains." It runs from east to west almost the whole breadth of the kingdom. See SCOTLAND.

GRANADA, a portion of Andalusia, in Spain, being one of those four districts denominated kingdoms, into which that rich province is divided. It is bounded on the west by Seville, on the north by Jaen and Murcia, on the east by Murcia, and on the south by the Mediterranean Sea. Its extent is 805 square leagues, and the number of its inhabitants 1,097,098. The density of the population on the plains is greater than in any other part of Spain; but as a great proportion of the country is covered with lofty, and in many parts uninhabitable mountains, it is not much more thickly peopled than the general average of the kingdom. The mountains of Granada are much higher than any other range in Europe; for though the extreme summit of Mont Blanc is somewhat higher than the most elevated peak of the Sierra Nevada, yet none of the other points in the Alps attains the same altitude. The ridge called, from its being perpetually covered with snow, the Sierra Nevada, runs from north-east to south-west. Geometrical levels were taken in 1804, and the highest peaks were found to be, Mulahacen, 12,762 feet, and Picacho de Veleta, 12,459 feet, above the level of the sea. The height at which perpetual snow is to be found is 9915 feet. In the winter indeed it descends considerably lower, but above that line it never wholly melts so as to discover the surface. This range of mountains declines gradually towards the south till it approaches Almeria, where it again rises to the height of 7800 feet on the Sierra de Gador. This sierra is a solid rock of marble, without any other covering than the snow, which lies on the higher parts of it three quarters of the year, and only totally melts in the hottest months of summer. Near it is the singular rock called Filabres, which appears to be an enormous pyramid of white marble, 2000 feet in height, and four miles in circumference at the base; and has no mixture of any other stones or earth with it. To the eastward of the range of the Sierra Nevada the mountains called the Apuxarras extend to the sea, and stretch from Almeria to Motril on the coast of the Mediterranean, about seventeen leagues. This range of mountains may be considered as a very sterile tract of country in general, but on it are mixed plains and valleys which are highly fruitful, and nourish considerable herds of cattle and flocks of sheep and goats, and besides feed great abundance of pigs, which furnish hams in considerable quantities. The plains interspersed in this mountain range afford great quantities of mulberry trees, on which silk worms are reared, and their produce is one of the foundations of the silk manufactories of the capital. It was to these mountains that the Moorish race was removed on the final subjection of their capital to Ferdinand; and the industry they displayed seems to have been continued by the other inhabitants, after the remains of that singular race were most impoliticly and wickedly banished from these mountain retreats to the shores of Africa.

Besides these mountains on the eastern division, there are many ranges between the capital and Gibraltar, which, though they do not equal them in height, exhibit a grandeur and sublimity both pleasing and awful. Amongst these may be classed the Sierra Vermeja and the Sierra de Arboto, which approach the coast near Marvella, and the Sierra Junquilla on the road to Ronda. These, though slightly sprinkled with snow, have no permanent covering of that substance, except during the winter months.

The rivers of Granada are the Xenil and the Darro, issuing from the Sierra Nevada; the Guadalhora, which rises in the mountains near Antequera, and waters the most fertile of its valleys; and the Guadiaro, which issues from the mountains near Ronda.

The valleys of Granada deserve attention, from being perhaps the most fertile spots in Europe, and yielding with but little labour the richest productions of nature in the greatest abundance. Amongst these is prominent the Vega or plain of Granada, if that can be called a valley which is 2400 feet above the level of the sea. This plain, however, is so surrounded by the loftiest mountains, that it is in effect, and has in appearance, all the properties of a rich valley. The melted snow from the Sierra Nevada is perpetually descending in the form of transparent rivulets; and the industry of the inhabitants has been constantly directed to conducting these into such channels as can most effectually irrigate the lands. As the melting of the ice and snow proceeds most rapidly in the warmest weather, the summer months, the parched land, which most requires moisture, is thus provided with it most copiously. The decomposition of the rocks which surround the plain is constantly proceeding, and the rapid torrents derived from the melting of the snow bring into the plain a constant succession of new soil, which in spreading itself over the land by the process of irrigation, refreshes the earth, and invigorates vegetation. The highest enjoyment a practical agriculturist of good observation can have, is in riding over this plain, and viewing the rapid progress of vegetation, the rich productions of the soil, and the admirable skill displayed in dispensing the refreshing streams which descend from the lofty mountains.

In the midst of this plain, and in the most fruitful and delightful part of it, is that estate which, by the gratitude of the Spanish nation, has been conferred on the Duke of Wellington. The Sota de Roma is a fine tract of land, about five miles in length and two miles in breadth. It was retained by Ferdinand at the conquest of Granada, and made an appendage to the crown; and several successive monarchs used it as a retreat from the cares of a throne. Having been granted to Wall when prime minister of Spain, he rebuilt the mansion in part, and fitted it up in the best taste. He improved the grounds, laid out gardens, and made roads through the woods, which he stocked with game of all kinds, but especially pheasants, a species of bird which does not generally thrive in other parts of Spain. At his decease it reverted to the crown, and was afterwards granted to Godoy, prince of the peace; but on his forfeiture it came again into the possession of the government, when it was granted in perpetuity to the Duke of Wellington. More than four thousand acres are woodland, and abound with good elm trees, the right of cutting which used to be reserved by the crown. The other part of this domain is excellent cultivated land, with great facilities of irrigation, and produces most extraordinary crops of wheat, barley, hemp, flax, and fruits of all kinds.

The parts of the plain near Alhama yield prodigious crops of wheat and barley. They are cultivated in open fields at a distance from towns or even villages. At seed time the proprietors with their labourers pitch tents on the ground, and remain at the fields till the seed is deposited. At the harvest, tents are again pitched; the inhabitants of the town fill them, and continue in the fields till the whole of the produce is cut and thrashed out. This last operation is performed on a thrashing floor in the open air. In each large division of corn-land there is a circular portion, very level, paved with large stones; on these thrashing floors the corn is piled in the straw, and a number of unbroken horses, or more commonly mares, are held by long reins, and driven round the circle. By their treading the corn is separated from the straw with great facility. The dry state which the straw is brought to by the time it is cut makes it separate with but little labour; and from this dryness of the straw, it is so broken in the operation of thrashing, that it becomes like our chopped straw, and is carefully preserved in that condition as food for cattle in those dry months when no vegetation is visible in the meadows. This plan of thrashing the corn on floors in the fields where it grew is derived from high antiquity, and its practice may be seen in the sacred writings at the time of the patriarch Abraham. So dry is the climate of Spain, that the corn could not be carried to a distance, even if the roads were good and wheel carriages were used, without shaking out the greater part of the grain. After this description of the mode of harvesting the grain, it need not be added that barns are not necessary appendages to a corn farm. The straw in the broken state here described is formed into stacks, and the grain, when separated from the straw, and by a flapping wheel from the chaff, is deposited in paniers, and conveyed on the backs of asses to the granaries of the proprietors in the towns, where, for the most part, and not on their farms, they reside. In some parts of Granada there is a mode of preserving wheat for many years without its sustaining any injury. In caves hewn in the granite rocks they carefully line the bottom and sides with chaff or the finest of the broken straw; the caverns are then filled with the grain in bulk, and the top covered with chaff to the thickness of about eighteen inches. In this state no humidity can reach it from without; and the heat of the climate having perfectly dried it in the process of harvesting, it may remain secure for almost any period. Some repositories of this kind made by the Moors three centuries ago have been discovered within recent periods, and the grain was as good as when first deposited. It was the practice of the Moors, on the birth of a child, to lay up its future portion in grain, concealed in these caves, which, from the turbulent state of the country, were usually in as secret spots as they could select. When the child reached maturity his property was pointed out and his provision appropriated; but sometimes those who knew of the secret deposit were cut off, and the grain remained buried without discovery.

Many practices in the husbandry of Granada which differ from those in the other parts of Spain may be traced to the circumstances in which the Moors were placed, when, having been subdued in the other parts of the peninsula, their sole dominion for three hundred years was contracted to the small but rich kingdom of Granada.

The cultivation of mulberry trees, and the breeding of silk worms which depend upon them, is an important portion of the agriculture of Granada. Long practice and attention has led the cultivators to know the species of mulberries which yield the most leaves, and the greatest quantity of silk from the worms that feed on them. The white mulberry, when grafted on the stock of the wild mulberry, is now almost universally preferred, as those leaves produce not only the greatest proportionate quantity of silk, but it is also of a much finer quality than that yielded by either the white or the black mulberry leaves. As the trees are cultivated not for the sake of the fruit, but solely for the food which the leaves supply, it is customary to cut off the tops, which, they find, diminishes the quantity of the fruit and increases that of the leaves. The worms suffer much by any great humidity in the leaves on which they feed; and hence the cultivators are careful not to gather any as long as the dew remains on them, or after a shower of rain; and if the weather appears lowering, it is the practice to gather as many leaves as will suffice for three or four days' consumption; but care is taken that they neither become shrivelled nor mildewed, in either of which cases they would injure the worm. There is perhaps no animal whose voracity compared with its size equals that of the silk worm, especially during the eight or ten days which precede their beginning to spin. It is estimated that the leaves of a tree of ten years growth are devoured in three days by as many worms as will yield seven pounds of silk. The silk produced by the worms here is calculated as one pound from 2500 worms. The quantity of silk produced on the plains of Granada, on an average of years, is 100,000 pounds, and there must consequently be two hundred and fifty millions of worms, and near three millions five hundred thousand mulberry trees in full bearing, besides those decayed, and those not arrived at maturity.

If the vegetable productions of Granada were enumerated, they would be found to include almost every gift of every climate; for as the variation in temperature descends from that of the coldest to that of almost the hottest regions of the globe, so the different productions are all to be met with here within a very narrow compass. On the high levels the apples, pears, and plums of the colder parts of Europe grow to perfection. In the middle regions they have wheat, barley, wine, hemp, flax, grapes, olives, peaches, apricots, pomegranates, and other similar fruits; whilst in the hotter regions in the low valleys, on a level with the sea, coffee, cotton, sugar cane, and indigo, are cultivated with success; and those more rare fruits, the pine-apple, the chircmaya, the guava, and the banana, are brought to perfection in the open air. The agriculture of the level parts from Manvella to Velez Malaga, except that the labourers are not negro slaves, exactly resembles that of the islands in the West Indies; and the face of the country and its different productions recal to the mind of the traveller the scenery, the odours, and all the sensations experienced in the finest districts of the tropical regions.

From the agriculture we turn next to the mineral riches which this province affords in return for the labour of man. In former times mines of gold and silver were wrought, and the sands of the river Darro were found to be enriched with grains of the former precious metal. The veins still exist; but since the discovery of the mines of Mexico and Peru, and the value of the precious metals has been reduced, they have ceased to yield sufficient to pay the labourers' wages that must be employed in them. Copper, iron, and lead are found in the mountains of secondary formation; and though from the scarcity of fuel they are not worked to the extent which they might be if that commodity were more abundant, yet it is ascertained that they are as rich in ore now as at the former periods when their produce formed the foundation of an extensive commerce with Egypt, Greece, and the borders of Asia. No part of the world abounds with more beautiful marbles than the province of Granada. The public buildings, the fountains, the statues, and the ornaments made from them on the spot, strike the beholder with surprise, by their beauty, their variety, and their cheapness; but from their bulky and weighty character, the difficulty of transporting them over mountains and precipices where no roads have been formed, is such as to preclude their removal with any chance of being repaid for the labour bestowed on it. Alabaster, jasper, and most beautiful serpentine, are in some degree articles of commerce; and the fluates of lime, called in England Derbyshire spar, are worked into various fanciful and ornamental pieces of furniture.

The manufactories of this province are considerable for the extent of the population, and consist of silks, linens, woollens, sail-cloth, leather, and other articles, the particulars of which will be found under the names of the different places in which they are carried on.

The foreign commerce almost wholly passes through the port of Malaga; and will be found under that article; but the domestic trade is the most considerable and most beneficial. The part to the north of the mountains supplies the sea coast with corn, cattle, and some manufactures, and receives in return coffee, sugar, cotton, and the other productions of the warmer climate. It sends to Castille corn, oil, and dried figs, and receives in return some wine and manufactured articles.

The salubrity of the climate of Granada varies with the various elevations. On the sea coast the valleys are excessively hot; and, though not uniformly, are frequently subject to those visitations which have thinned the population of several cities in the western hemisphere. In the year 1804 an epidemic fever which passed along the shores of Spain visited this province with most fearful destruction to human life; and, though not to the same extent, yet before and since, such fevers have prevailed. On the more elevated plains, and on the mountains, such pestilential dispensations have not been experienced, and the inhabitants enjoy as much health, strength, activity, and longevity as in any part of the world.

The interesting events of the history of Granada, its prosperity under the Moorish government, its final subjugation, and the subsequent extirpation of the remainder of the Arabian race, will fall more naturally under our notice of the history of the whole kingdom of Spain.

GRANADA, a city of Spain, and capital of the province or kingdom of that name, in Andalusia. It is situated partly in the celebrated plain called the Vega de Granada, and partly on the declivity of a hill whose summit is covered with that massive pile of buildings called the Alhambra, of which a description may be seen under that article. The rivers Xenil and Darro have their rise in the mountains, and pass through the city; the former is a clear, and at times a small stream, but the latter is a mountain torrent, at some periods almost destitute of water, and at others overflowing its banks, and producing extensive inundations. After traversing the plain, both streams unite and force their way into the Guadalquivir. Many of the streets of Granada are steep, most of them are narrow, and all of them are ill paved. No object can be more strikingly beautiful at a few miles distance than this city, but the appearance on entering it by no means corresponds to the distant impressions.

The market-place or great square is spacious and well proportioned. The houses have piazzas, which afford shelter from the heat of the sun; but the want of glass windows, and the substitution of red shutters, give them a mean appearance. The cathedral is a very large and splendid but irregular building, having been formed by throwing into one edifice three contiguous churches. The high altar, the pulpits, and the choir, are fine groups, and beautifully adorned with some of the finest specimens of variegated and highly polished marble that has been found in this vicinity. It has within it two fine monuments, one to the memory of Philip I., the other to that of Ferdinand and Isabella; and it is adorned with some pictures from the pencil of that celebrated artist Alonzo Cano, which, though disgusting to Protestants from the sacred objects they represent, yet possess exquisite merit as paintings. There are some fine statues executed by the same artist, who was a sculptor as well as a painter. The vice-regal palace, in which is the supreme court of justice for the province, is an extensive and splendid building; but its effect is destroyed by having houses so close as to prevent a proper view of it. The palace of the archbishop is a very large pile, but of no particular beauty, though, as having been the scene of the adventures of Gil Blas, in the work of Le Sage, which every one has read, it is generally inquired for and noticed by travellers.

The city of Granada contains at present 66,660 inhabitants, who are generally a more industrious people than the other natives of Spain. The activity of the Moors, if not their blood, has been left behind them; and, in spite of the bad maxims of the court of Madrid, this city displays considerable industry in many arts and manufactures. The woollen manufactories employ about 7000 persons of the two sexes, and afford cloths, serges, baizes, and stuffs, but not in sufficient quantities for the consumption of the surrounding district, the deficiency being supplied by importation through the port of Malaga. The whole of the silk which the plain yields is made in this city into taffetas, satins, ribbons, and similar goods; and, besides their own produce, silk in some years is brought from Valencia to be used in this place. There are manufactories of linen, sail-cloth, and a very small one of cotton. The sail-cloths are estimated as of most excellent quality, and are but little subject to the mildew in the most humid climate. Iron and steel are made here into the various smaller articles required for domestic and agricultural purposes. The Carthusian convent is an extensive establishment; and the fathers possess several farms, which they cultivate themselves; and some other of the religious foundations are very rich. Institutions for education are upon a low scale; and most of those destined for the learned profession receive their instruction either in the universities of Seville or Alcala. From the locality of this city, it is remarkably healthy. The vicinity of the Sierra Nevada, from which cool breezes blow in the midst of summer, tends to give a freshness to the atmosphere, even in the dog-days; and, considering the productions, the climate, and the beautiful streams, it is not wonderful that the Moors long looked back with fond regret to the delightful spot from which, after an obstinate resistance, they were at length most reluctantly driven.

GRANADA, or *Grenada*, one of the Caribbee Islands. See GRENADA.

GRANADA, a town of Mexico, in America, in the intendancy of Nicaragua, and in the republic of Guatimala, seated on the Lake Nicaragua. It contains a handsome church and four convents, one of which, belonging to the Franciscans, is amongst the most ancient of these establishments in the kingdom. There is here some commerce; but the place would appear to have declined. Long. 86. 21. W. Lat. 11. 30. N.

GRANADA, *New*, a province of South America. See VENEZUELA.

GRANADIER, or GRENADIER, originally a soldier armed with a sword, a firelock, a bayonet, and a pouch full of hand grenades; whence the name. Grenadiers now differ from the rest of the battalion only in their superior size and stature, and in certain distinctive peculiarities of uniform. They are always composed of the tallest and stoutest men, and employed on services where strength and courage united are necessary to ensure success; and, in some armies, they have more pay than the common soldiers. Every battalion of infantry has generally attached to it a company of grenadiers, who take the right of the battalion, the left being occupied by the light company. Grenadiers were first instituted in France in 1667, when four or five were attached to each company; but in the year 1670 they were formed into companies, and, in 1685, introduced into the British service.

GRANADO, or GRENADE (so called from being filled with grains of powder, as a pomegranate is with kernels), is, in war, a hollow ball or shell of iron or other metal, of about two inches and a half diameter, which being filled with fine powder, is set on fire by means of a small fuse made of well-seasoned beech-wood driven into the fuse-hole, and is thrown by the grenadiers into places where men stand thick, particularly into the trenches and other lodgments effected by the enemy. As soon as the composition within the fuse gets to the powder in the grenade, it bursts into pieces, greatly to the damage of all who happen to be in its way. Grenades were first made about the time when shells were invented, and first used in 1594. They have now unaccountably sunk into disuse; but, in the opinion of some, there is nothing more proper than to have grenades to throw amongst the enemy who have jumped into the ditch. During the siege of Cassel under the Count de la Lippe, in the campaign of 1762, a young engineer undertook to carry one of the outworks with a smaller detachment than that which had been repulsed, and succeeded with ease from the use of grenades; which is a proof that they should not be neglected, either in the attack or defence of posts. There are two sorts of grenades, viz. *grenades de rempart* and *grenades à main*. *Grenades de rempart* are those which are rolled from the top of the parapet into the ditch, and which in calibre are equal to an eighteen, and sometimes to a thirty-two pounder. *Grenades à main* are thrown by the hand into the covered-way and trenches; their calibre is that of a four-pounder, and they weigh about two pounds. The ordinary thickness of grenades is four lines, or one third of an inch, throughout. There is also a sort of grenade which is thrown out of a mortar, and which is used for the purpose of annoying the besieging enemy,

GRANARD, a borough, market, fair, and post town, in the county of Longford, and province of Leinster, situated fifty-two miles from Dublin, and about sixteen north-east of Longford. Here is a remarkable hill or mount, called the *Moat of Granard*, supposed to be artificial, and the site of a Danish castle or fort, which commands from its summit a most extensive prospect.

GRANARY, a building to lay up or store corn in, especially that which is designed to be kept for a considerable time.

Sir Henry Wotton recommends that a granary should be made to look towards the north, because that quarter is the coolest and most temperate. Mr Worlidge observes, that the best granaries are built of brick, with quarters of timber wrought in the inside, to which the boards, with which the inside of the granary must be lined, must be nailed so close to the bricks that there may not be any room left for vermin to shelter themselves. There may be many storeys one above another, but these should be near the one to the other, because the shallower the corn lies, it is the better, and the more easily turned.

The two great cautions to be observed in the erecting of granaries are, to make them sufficiently strong, and to expose them to the most drying winds. In many parts of England, particularly in Kent, corn is ordered in this manner. To separate it from dust and other impurities after it is thrashed, it is tossed with shovels from one end to the other of a long and large room; the lighter substances fall down in the middle of the room, and the corn only is carried from side to side or from end to end of it. After this the corn is screened, and being then brought into the granaries, it is spread about half a foot thick, and turned from time to time about twice in a week; the screening of it is also repeated once a week. This sort of management is continued about two months, after which it is laid a foot thick for two months more; and during this time it is turned once a week, or twice if the season be damp, and now and then screened again. After about five or six months, it is raised to two feet thickness in the heaps, and then turned once or twice in a month, and screened now and then. After a year, it is laid two and a half or three feet deep, and turned once in three weeks or a month, and screened proportionally. When it has lain two years or more, it is turned once in two months, and screened once a quarter; and how long soever it be kept, the oftener the turning and screening are repeated, the better the grain will be found to be preserved. It is proper to leave an area of a yard wide on every side of the heap of corn, and other empty spaces, into which the corn may be turned and tossed as often as required. In Kent two square holes are made at each end of the floor, and a round one in the middle, by means of which the corn is thrown out of the upper into the lower rooms, and so up again, that it may be the better turned and aired. Their screens are made with two partitions, to separate the dust from the corn, which falls into a bag; and when sufficiently full this is thrown away, whilst the pure and good corn remains behind. Corn has by these means been kept in our granaries thirty years; and it is observed, that the longer it is kept the more flour it yields in proportion to the corn, and the purer and whiter the bread is, the superfluous humidity only evaporating in the keeping. At Zurich in Switzerland, corn has been kept eighty years, or longer, by methods of a similar description.

The public granaries at Dantzick are seven, eight, or nine storeys in height, having a funnel in the midst of each floor, to let down the corn from one to another. They are built so securely, that though every way surrounded with water, the corn contracts no damp, and the vessels have the convenience of coming up to the walls to be loaded. The Russians preserve their corn in subterranean granaries of the figure of a sugar-loaf, wide below and narrow at the top, the sides being well plastered, and the top covered with stones. They are careful to have the corn well dried before it be laid into these storehouses, and often dry it by means of ovens, the summer dry weather being too short to effect this sufficiently. Dantzick is the grand storehouse or repository of the fruitful kingdom of Poland. The wheat, barley, and rye, of a great part of the country, are there laid up in parcels of twenty, thirty, or sixty lasts in a chamber, according to the size of the room; and this is turned every day or two, to keep it sweet and fit for shipping.

According to the rules of Vitruvius, a granary should always be at the top of a house, and have its openings only to the north or east, that the corn may not be exposed to the damp winds from the south and west, which are very destructive to it; but the contrary winds are very necessary and wholesome, serving to cool it and absorb all external humidity. There must also be openings in the roof, to be set open in dry weather, partly to let in fresh air, and partly to let out the warm effluvia which are often emitted by the corn. The covering of the roofs should always be of tiles, because in the worst seasons, when the other openings cannot be safe, there will always be a considerable inlet for fresh air, and an issue for the vapours by their joinings, which are never close. If there happen to be any windows to the south, great care must be taken to shut them in moist weather, and in the time of the hot southern winds. There must not be a cellar or any other damp place under a granary, nor should it ever be built over stables; for in either of these cases the corn will certainly suffer by the vapours, and be rendered damp in one, and ill tasted in the other.

M. Duhamel and Dr Hailes recommend various contrivances for ventilating or blowing fresh air through corn laid up in granaries or ships, in order to preserve it sweet and dry, and to prevent its being devoured by weevils or other insects. This may be done by nailing wooden bars or laths on the floor of the granary, about an inch distant from each other, when they are covered with hair-cloth only, or at the distance of two or three inches, when coarse wire-work, or basket-work of osiers, is laid under the hair-cloth, or when an iron plate full of holes is laid upon them. These laths may be laid across other laths, nailed at the distance of fifteen inches, and two or more inches deep, that there may be a free passage for the air under them. The under laths must come about six inches short of the wall of the granary at one end, on which a board is to be set edgewise, sloping against the wall; for, by this disposition, a large air-pipe is formed, which having an open communication with all the interstices between and under the bars, will admit the passage of air below forcibly through a hole at the extremity, and consequently carry off the moist exhalations of the corn. The ventilators for supplying fresh air may be fixed against the wall, on the inside or outside of the granary, or under the floor, or in the ceiling; but wherever they are fixed, the handle of the lever that works them must be out of the granary, otherwise the person who works them would be in danger of suffocation when the corn is fumigated with burning brimstone, as is sometimes done for destroying weevils. Small moveable ventilators will answer the purpose for ventilating corn in large bins in granaries, and may easily be moved from one bin to another. If the granary or corn ship be very long, the main air-pipe may pass lengthwise along the middle of it, and convey air on both sides under the corn. In large granaries, double ventilators laid upon each other may be fixed at the middle and near the top of the granary, that they may be worked by a windmill fixed on the roof of the building, or by a water-mill. The air is conveyed from the ventilators through a large trunk or trunks, reaching down through the several doors to the bottom of the granary, with branching trunks to each floor, by means of which it may be made to pass into a large trunk along the adjoining cross walls; and from these trunks several lesser trunks, about four inches wide, branch off, at the distance of three or four feet from one another, and reach through the whole length of the granary, their farther ends being closed. Seams of one tenth or one twelfth of an inch should also be left open at the four joinings of the boards, where they are nailed together, that the air may pass through them into the corn. In some of these lesser trunks there may be sliding shutters, to stop the passage of the air through those trunks which are not covered with iron, or to ventilate one part of the granary more briskly than others, as there may be occasion. There should also be wooden shutters, hung on hinges at their upper part, so as to shut close of themselves; and these should be fixed to openings in the walls of the granary on their outside; by which means they will readily open to give a free passage for the ventilating air, which ascends through the corn, but will instantly shut when the ventilation ceases, and thereby prevent any dampness of the external air from entering. The ventilation should be made only in the middle of dry days, unless the corn, when first put in, be cold and damp.

In lesser granaries, where the ventilators must be worked by the hand, if these granaries stand on straddles, so as to have their lowest floor at some distance from the ground, the ventilators may be fixed under the lowest floor, between the straddles, so as to be worked by men standing on the ground without or within the granary. A very commodious and cheap ventilator may be made for small granaries, by constructing a ventilator of the door of the granary, which may be easily effected by making a circular screen, of the size of a quarter of a circle, behind the door; but in order to this, the door should open, not inwards, but outwards, so that when it falls back, it may be worked to and fro in the screen, which must be exactly adapted to it in all parts of the circular side of the screen, as well as at the top and bottom. But there must be a stop at about eight or ten inches distance from the wall, to prevent the door falling farther back, and that there may be room for a valve in the screen to supply it with air, which will be driven in by the door, through a hole made in the wall near the floor, into the main air-trunk, in which also there should be another valve over the hole in the wall, to prevent the return of the air.

GRANATE, or GRANITE, a species of mineral belonging to the siliceous genus. See MINERALOGY.

GRAND, a term rather French than English, though used on many occasions in our language. It has the same import with *great*, being formed from the Latin *grandis*. In this sense we say, the grand-master of an order, as the grand-master of Malta and of the free-masons; the grand-signior and the grand-visier; grandfather, grandmother, and the like. Amongst the French there were formerly several officers thus denominated; as grand almoner, grand ecuyer, grand chambellan, grand voyer, and the like.

GRAND Distress (*districtio magna*), in *English Law*, a writ of distress, so called on account of its extent, which reaches to all the goods and chattels of the party within the county.

GRAND Gusto, amongst painters, a term used to intimate that there is something in the picture calculated to surprise, please, and instruct.

GRANDEE is a term applied to a lord of the first rank or highest quality. In Spain the name *grandees* is used absolutely to denote the great lords of the court, to whom the king has granted permission to remain covered in his presence. There are some grandees for life only, who are made by the king's saying simply, "Be covered;" others are grandees by descent, and made by the king's saying, "Be covered for thyself and heirs." The latter are of course the higher and nobler grade.

GRANDEUR and SUBLIMITY. These terms have a double import, commonly signifying the quality or circumstance in objects by which the emotions of grandeur and sublimity are produced, and sometimes also the emotions themselves.

In treating this subject, it is necessary that the impression made on the mind by the magnitude of an object, abstracting from its other qualities, should be ascertained; and because abstraction is a mental operation of some difficulty, the safest method of judging is, to choose an object which is neither beautiful nor deformed, if such an one can be found. The plainest that occurs is a huge mass of rubbish, the ruins perhaps of some extensive building; or a large heap of stones, such as are collected together for keeping in memory a battle or other remarkable event. Such an object, which in miniature would be perfectly indifferent, makes an impression by its magnitude, and even appears agreeable. And supposing it large enough to fill the eye, and prevent the attention from wandering to other objects, the impression it makes will be so much the deeper.

But though a plain object of this kind be agreeable, it is not termed *grand*; nor is it entitled to that character, unless, together with its size, it be possessed of other qualities which contribute to beauty, such as regularity, proportion, order, or colour; but, according to the number of such qualities combined with magnitude, it will be more or less grand. Thus St Peter's church at Rome, the great pyramid of Egypt, the Alps towering above the clouds, an arm of the sea, and, above all, a clear and serene sky, are grand, because, besides their dimensions, they are beautiful in an eminent degree. On the other hand, an overgrown whale, having a disagreeable appearance, is by no means grand. A large building, remarkable for its regularity and proportions, is grand; and yet a much larger building, if destitute of regularity, has not the least tincture of grandeur. A single regiment in battle-array makes a grand appearance, which the surrounding crowd does not, though perhaps ten times the number; and a regiment where the men are all in one uniform, and the horses of one colour, makes a grander appearance, and consequently strikes more terror, than where there is confusion of colour and dress. Thus greatness or magnitude is the circumstance which distinguishes grandeur from beauty; in other words, agreeableness is the genus, of which beauty and grandeur are species.

The emotion of grandeur, if duly examined, will be found to furnish additional proof of the truth of our doctrine. That this emotion is pleasant in a high degree, requires no other evidence than an appeal to the feelings, produced by the view of a grand object; and if an emotion of grandeur be pleasant, its cause or object, as already observed, must infallibly be agreeable in proportion.

The qualities of grandeur and beauty are not more distinct than the emotions which these qualities produce in a spectator. All the various emotions of beauty have one common character; that of sweetness and gaiety. The emotion of grandeur has a different character. A large object that is agreeable, occupies the whole attention, and swells the heart with a vivid emotion, which, though extremely pleasant, is rather serious than gay. And this affords a good reason for distinguishing in language these different emotions. The emotions raised by colour, regularity, proportion, and order, have such a resemblance to each other, as readily to come under one general term, *the emotion of beauty;* but the emotion of grandeur is so different from these, that it deserves to have a peculiar name applied to it.

Though regularity, proportion, order, and colour, contribute to grandeur as well as to beauty, yet these qualities are not by any means so essential to the former as to the latter. To establish this proposition, some preliminary remarks are necessary. In the first place, the mind, not being totally occupied with a small object, can give its attention at the same time to every minute part; but in a great or extensive object, the mind, being totally occupied with the capital and striking parts, has no attention left for those which are little or indifferent. In the next place, two similar objects appear not to be similar when viewed at different distances; the similar parts of a very large object cannot be seen except at different distances; and for this reason its regularity, and the proportion of its parts, are in some measure lost to the eye; neither are the irregularities of a very large object so conspicuous as those of one which is small. Hence it is that a large object is not so agreeable by its regularity as a small object, nor so disagreeable by its irregularities.

These considerations render it evident that grandeur is satisfied with a less degree of regularity, and of the other qualities mentioned, than is requisite for beauty. This may be illustrated by an experiment. Suppose that, approaching a small conical hill, we take an accurate survey of every part, and are sensible of the slightest deviation from regularity and proportion. If the hill were to be considerably enlarged, so as to make us less sensible of its regularity, it would upon that account appear less beautiful. It would not, however, appear less agreeable, because some slight emotion of grandeur would come instead of that which it had lost in beauty. Lastly, suppose the hill enlarged to a great mountain; then the small degree of beauty which is left would be merged in its grandeur. Hence it is that a towering hill is delightful, if it have but the slightest resemblance of a cone; and a chain of mountains is not less so, though deficient in the accuracy of order and proportion. We require a small surface to be smooth; but in an extensive plain, considerable inequalities are overlooked. In a word, regularity, proportion, order, and colour, contribute to grandeur as well as to beauty; but with this remarkable difference, that in passing from small to great they are not required in the same degree of perfection. This remark serves to explain the extreme delight we feel in viewing the face of nature, when sufficiently enriched and diversified with objects. The bulk of the objects in a natural landscape are beautiful, and some of them grand; a flowing river, a spreading oak, a round hill, an extended plain, are delightful; and even a rugged rock, or barren heath, though in themselves disagreeable, contribute by contrast to the beauty of the whole; but if to these we add the verdure of the fields, the mixture of light and shadow, and the sublime canopy spread over all, it will not appear wonderful that so extensive a group of splendid objects should swell the heart to the utmost, and raise the strongest emotion of grandeur. The spectator becomes conscious of an enthusiasm which cannot bear confinement, or the strictness of regularity and order; he loves to range at large, and is so enchanted with magnificent objects as to overlook slight beauties or deformities.

The same observation is applicable in some measure to works of art. In a small building, the slightest irregularity is disagreeable; but in a magnificent palace, or in a large Gothic church, irregularities are less regarded. In an epic poem, we pardon many negligences which would not be permitted in a sonnet or an epigram. But notwithstanding such exceptions, it may justly be laid down as a rule, that in works of art, order and regularity ought to be governing principles; and hence the justice of the observation of Longinus, that "in works of art we have regard to exact proportion, and in those of nature, to grandeur and magnificence."

The same reflections are in a great measure applicable to sublimity, particularly that, like grandeur, it is a species of agreeableness; that a beautiful object placed on an elevated position appears more agreeable than formerly, and produces in the spectator a new emotion, termed *the emotion of sublimity;* and that the perfection of order, regularity, and proportion, is less required in objects elevated or placed at a distance, than in those which are at hand.

But though a grand object is agreeable, we must not thence infer that a little object is disagreeable; which would be unfortunate for man, considering that he is surrounded with so many objects of that description. The same thing holds true with respect to place. A body placed high is agreeable; but the same body placed low is not by that circumstance rendered disagreeable. Littleness and lowness of place are precisely similar in this, that of themselves they produce neither pleasure nor pain. And in this may be discovered a peculiar adaptation in fitting the internal constitution of man to his external circumstances. Were littleness and lowness of place agreeable, greatness and elevation could not be so; were littleness and lowness of place disagreeable, they would occasion uninterrupted uneasiness.

The difference between great and little with respect to agreeableness is remarkably felt in a series when we pass gradually from one extreme to the other. A mental progress from the capital to the kingdom, and from that to Europe, to the whole earth, to the planetary system, to the universe, is extremely pleasant; the heart swells, and the mind is dilated at every step. Nor is the returning in an opposite direction positively painful, though our pleasure lessens at every step, till it vanish into indifference. Such a progress may sometimes produce pleasure of a different sort, arising from our taking a narrower and narrower inspection. The same observation holds good in a progress upwards and downwards. Ascent is pleasant because it elevates us: but descent is never painful; on the contrary, it is for the most part pleasant from a different cause, that it is according to the order of nature. The fall of a stone from any height is extremely agreeable by its accelerated motion. We feel it pleasant to descend from a mountain, because the descent is natural and easy. Neither is looking downwards painful; whilst, on the contrary, looking down upon objects forms part of the pleasure of elevation. Looking down becomes painful only when the object is so far below as to create dizziness.

It has been remarked, that the emotions of grandeur and sublimity are nearly allied; and hence it is, that the one term is frequently put for the other. An increasing series of numbers, for example, producing an emotion similar to that of mounting upwards, is commonly termed *an ascending series;* a series of numbers gradually decreasing, producing an emotion similar to that of going downwards, is commonly termed *a descending series.* We talk familiarly of going *up* to the capital, and of going *down* to the country; and from a lesser kingdom we talk of going *up* to a greater, as in the *anabasis* of the Greek language, when one travelled from Greece to Persia. We discover the same mode of expression in the language even of Japan; and its universality proves that it is the offspring of a natural feeling.

This leads us to consider next grandeur and sublimity in a figurative sense, and as applicable to the fine arts. Hitherto these terms have been taken in their proper sense as applicable to objects of sight only; and it is of importance to bestow some pains upon this, because, generally speaking, the figurative sense of a word is derived from its proper sense, and particularly so in the present instance. Beauty, in its original signification, is confined to objects of sight; but as many other objects, intellectual as well as moral, raise emotions resembling that of beauty, the resemblance of the effects prompts us to extend the term *beauty* to these objects. The same principle serves equally to explain the terms *grandeur* and *sublimity*, when employed in a figurative sense. Every emotion, from whatever cause it proceeds, which resembles an emotion of grandeur or elevation, is called by the same name. Thus generosity is said to be an *elevated* emotion, as well as great courage; and that firmness of soul which is superior to misfortunes obtains the peculiar name of *magnanimity.* On the other hand, every emotion which contracts the mind, and fixes it upon things trivial or of no importance, is termed *low*, by its resemblance to an emotion produced by a little or low object of sight. Thus an appetite for trifling amusements is called a *low taste.* The same terms are applied to characters and actions. We talk familiarly of an *elevated* genius, of a *great* man, and equally so of *littleness* of mind. Some actions are *great* and *elevated*, and others are *little* and *grovelling.* Sentiments, and even expressions, are characterised in the same manner. An expression or sentiment which raises the mind is denominated *great* or *elevated;* and hence the sublime in poetry. In such figurative terms, we lose the distinction between great and elevated in their proper sense; for the resemblance is not so entire as to preserve these terms distinct in their figurative application. And we carry this figure still further. Elevation, in its proper sense, imports superiority of place, and lowness inferiority of place; hence we say a man of *superior* talents, of *superior* rank, of *inferior* parts, of *inferior* taste, and such like. The veneration we have for our ancestors, and for the ancients in general, being similar to the emotion produced by an elevated object of sight, justifies the figurative expression of the ancients being *raised* above us, or possessing a *superior* place. The notes of the gamut, proceeding regularly from the blunter or grosser sounds to the more acute and piercing, produce in the hearer a feeling somewhat similar to that which is produced by mounting upwards; and this gives occasion to the figurative expressions, *a high note, a low note.*

Such indeed is the resemblance in feeling between real and figurative grandeur, that amongst the nations on the eastern coast of Africa, who are directed purely by nature, the officers of state are, with respect to rank, distinguished by the length of the batoon each carries in his hand; and in Japan, princes and great lords exhibit their rank by the length and size of their sedan poles. Again, it is a rule in painting, that figures of a small size are most proper for grotesque pieces; but that an historical subject generally requires figures as large as the life, or nearly so. The resemblance of these feelings is in reality so strong, that elevation in a figurative sense is observed to have the same effect, even externally, with real elevation.

The resemblance in feeling between real and figurative grandeur is humorously illustrated by Addison in criticising English tragedy. "The ordinary method of making a hero is to clap a huge plume of feathers upon his head, which rises so high, that there is often a greater length from his chin to the top of his head than to the sole of his foot. One would believe that we thought a great man and a tall man the same thing. As these superfluous ornaments upon the head make a great man, a princess generally receives her grandeur from those additional incumbrances that fall into her tail. I mean the broad sweeping train that follows her in all her motions, and finds constant employment for a boy who stands behind her to open and spread it to advantage." On the same principle, the Scythians, impressed with the fame of Alexander, were astonished when they found him a little man.

The gradual progress from small to great is not less remarkable in figurative than in real grandeur or elevation. Every one must have observed the delightful effect of a number of thoughts or sentiments, artfully disposed like an ascending series, and making impressions deeper and deeper as they proceed. Such a disposition of members or clauses in a period is termed a *climax.*

Within certain limits grandeur and sublimity produce their strongest effects; which, however, lessen by excess as well as by defect. This is remarkable in grandeur and sublimity taken in their proper sense. The grandest emotion which can be excited by a visible object is where the object can be taken in at one view; but if so immense as to be comprehended only in parts, it tends rather to distract than to satisfy the mind.[1] In like manner, the strongest emotion produced by elevation is where the object is seen distinctly; a greater elevation lessens in appearance the object, till it vanishes out of sight with its pleasant emotions. The same thing is equally remarkable in figurative grandeur and elevation. Sentiments may be so strained as to become obscure, or to exceed the capacity of the human mind; but against such license of imagination every good writer will be upon his guard; and it is therefore of importance to observe, that even the true sublime may be carried beyond that pitch which produces the strongest impression. We are undoubtedly susceptible of a greater elevation than can be inspired by human actions the most heroic and magnanimous: this is evident from the feelings produced by Milton's description of superior beings: yet every man must be sensible of a more constant and agreeable elevation when the history of his own species is the subject. He enjoys an elevation equal to that of the greatest hero, of an Alexander or a Cæsar, of a Brutus or an

---

[1] It is justly observed by Addison, that perhaps a man would have been more astonished with the majestic air which appeared in one of Lysippus's statues of Alexander, though no bigger than the life, than he might have been with Mount Athos had it been cut into the figure of the hero, according to the proposal of Phidias, with a river in one hand and a city in the other.

Epaminondas; he accompanies these heroes in their most sublime sentiments and hazardous exploits, with a magnanimity equal to theirs; and he finds it no stretch to preserve the same tone of mind for hours together without sinking. The case is not the same in describing the actions or qualities of superior beings. The reader's imagination cannot keep pace with that of the poet; the mind, unable to support itself in a strained elevation, falls as from a height, and the fall is immoderate like the elevation; or where that effect is not felt, it must be prevented by some obscurity in the conception, which frequently attends the descriptions of unknown objects. A mind unable to raise itself to the full contemplation of the Supreme Being self-existent and eternal, or to support itself in a strained elevation, finds itself more at ease in using the intercession of some saint whose piety and penances whilst on earth are supposed to have rendered him a favourite in heaven; and hence the part assigned to tutelary saints, such as St Francis and St Dominic, amongst the Roman Catholics.

Objects of sight which are not remarkably great nor elevated scarcely raise any emotion of grandeur or sublimity; and the same things hold respecting other objects; for we often find the mind roused and animated, without being carried to that height. This difference may be discerned in many sorts of music, as well as in some musical instruments. A kettle-drum rouses, and a hautboy is animating; but neither of them inspires an emotion of sublimity. Revenge animates the mind in a considerable degree; but it never produces an emotion which can be termed *grand* or *sublime;* and perhaps no disagreeable passion ever has that effect.

No desire is more universal than that of being exalted and honoured; and upon this account chiefly are we ambitious of power, riches, titles, fame, which would suddenly lose their relish did they not elevate us above others, and command submission and deference; indeed it may be thought that our attachment to things grand and lofty proceeds from their connection with our favourite passion. This connection has undoubtedly its effect; but that the preference given to things grand and lofty must have a deeper root in human nature, will appear from considering that many bestow their time upon low and trifling amusements, without having the least tincture of such a noble passion; yet these very persons talk the same language with the rest of mankind, and prefer the more elevated pleasures; they acknowledge a more refined taste, and are ashamed of their own as low and grovelling. This sentiment, constant and universal, must be the work of nature; and it plainly indicates an original attachment in human nature to every object which tends to elevate the mind. Some men may have a greater relish for an object not of the highest rank; but they are conscious of the preference given by mankind in general to things grand and sublime, and they are sensible that their own peculiar taste ought to yield to the general inclination.

What is said above suggests a rule for attaining the sublime in such works of art as are susceptible of it; and that is, to present those parts or circumstances only which make the greatest figure, keeping out of view every thing low or trivial; for the mind, elevated by an important object, cannot, without reluctance, be forced down to bestow any share of its attention upon trifles. Such a judicious selection of capital circumstances is by an eminent critic styled grandeur of manner. In none of the fine arts is there so great scope for that rule as in poetry, which thus enjoys a remarkable power of bestowing upon objects and events an air of grandeur. When we are spectators, every minute object presents itself in its order; but in describing at second hand, these are laid aside, and the capital objects are brought close together. A judicious taste in thus selecting the most interesting incidents, to give them an united force, accounts for a fact which may appear surprising; namely, that we are more moved by spirited narrative at second hand, than by being spectators of the event itself, in all its circumstances.

There is another rule which chiefly regards the sublime, though it is applicable to every sort of literary performance intended for amusement; namely, to avoid as much as possible abstract and general terms. Such terms, like mathematical signs, are contrived to express our thoughts in a concise manner; but images, which are the life of poetry, cannot be raised in any perfection except by introducing particular objects. General terms, which comprehend a number of individuals, must however be excepted from this rule. Our kindred, our clan, our country, and words of the like import, though they scarcely raise any distinct image, have a wonderful power over the passions; the greatness of the complex object overbalances the obscurity of the image; and the associations, of which it is the mnemonic type, fill the mind with exalted emotions.

Grandeur being an extremely vivid emotion, is not readily produced in perfection, except by reiterated impressions. The effect of a single impression can be but momentary; and if one feel suddenly something like a swelling or exaltation of mind, the emotion vanishes as soon as felt. Single thoughts or sentiments are often cited as examples of the sublime; but their effect is far inferior to that of a grand subject displayed in its capital parts.

The straining of an elevated subject beyond due bounds, or beyond the reach of ordinary conception, is not a vice so frequent as to require the correction of criticism. But the false sublime is a rock which writers of more fire than judgment commonly split upon. One species of false sublime, known by the name of bombast, is common amongst writers of a mean genius; it is a serious endeavour, by strained description, to exalt a low or familiar subject, which, instead of becoming sublime, fails not to become ridiculous. The mind, indeed, under the influence of some animating passions, is extremely prone to magnify its objects beyond natural bounds; but such hyperbolical description has its limits, and when carried beyond the impulse of the propensity, it degenerates into burlesque. Another species of false sublime, which is still more faulty than bombast, is that of forcing elevation by introducing imaginary beings without preserving any propriety in their actions; as if it were lawful to ascribe every extravagance and inconsistency to beings of the poet's creation. In a word, exaggeration of every kind, with a view to produce a great effect, is not only contrary to the principles of good taste, but becomes disgusting or ludicrous, very probably both.

GRANGE, an ancient term for a barn or place in which to lay up and thrash corn. The word is formed from the Latin *granea* or *granum,* grain or corn. Hence also *granger* or *grangier,* a grange-keeper or farmer. Grange is also used, in a more extensive sense, to signify a whole farm, with all the appendages of stables for horses, stalls for cattle, and the like.

GRANGER, James, a well-known biographer, who has himself been left without any memorial. The time and place of his birth, and the condition of his parents, are equally unknown. He studied, however, at Christ Church, Oxford, which he probably left without taking a degree; and having entered into holy orders, was presented to the vicarage of Shiplake in Oxfordshire, which appears to have been his only preferment. In the dedication of his Biographical Dictionary, which was published in 1769, he informs us that his name and person were at that time known to few persons, as he had the good fortune to retire early to independence, obscurity, and contentment. In 1772 he published a sermon, entitled An Apology for the Brute Creation, in which he strongly censured cruelty to animals; but which, owing to the mention made in it of horses and dogs, seems to have excited disgust amongst the purists of that time. In 1773 he presented to the public another sermon on the Nature and Extent of Industry, which, notwithstanding a strange dedication, was more favourably received. But his principal work, indeed that by which alone he is now known, is his Biographical History of England, from the time of Egbert the Great to the Revolution, a production of very considerable merit, which occupied him for many years, and of which he lived to see two editions sold. In this work he has only given biographies of those persons of whom some engraved portrait had been executed; and this circumstance, joined to the success which it met with, seems to have had the effect contemplated by the author, namely, to create a taste for collections of portraits. The Biographical History was first published in 1769, in four thin vols. quarto; but the second and subsequent editions have been published in octavo. On the 14th April 1776, whilst at the communion table in the act of administering the sacrament, Granger was seized with an apoplectic fit, and, notwithstanding he had the benefit of immediate medical assistance, died next morning. This affecting circumstance is alluded to in the following verses, written by a friend:

More happy end what saint e'er knew?
  To whom like mercy shown?
His Saviour's death in rapturous view,
  And unperceived his own.

GRANI, in our ancient writers, moustaches or whiskers of a beard. The word seems to have been formed from the ancient British or Irish *greann*, a beard. It is stated as a reason why the cup is refused to the laity, *Quia barbati, et prolixos habent granos, dum poculum inter epulas sumunt, prius liquore pilos inficiunt, quam ori infundunt.*

GRANICUS, a small river near the Hellespont, in Asia Minor, remarkable for the first victory gained by Alexander the Great over the armies of Darius.

GRANITE, one of the primitive rocks. See MINERALOGY.

GRANITILLO, or GRANITEL, a name given by some mineralogists to a particular species or variety of granite, which sometimes contains hornblende.

GRANIVOROUS, an appellation given to animals which feed on corn or seeds, and which are principally of the bird kind.

GRANT, in *Law*, a conveyance in writing of such things as cannot pass or be conveyed by word only.

GRANT, *Francis*, an eminent Scottish lawyer and judge, known in the latter capacity under the title of Lord Cullen, was descended from a younger branch of the family of the Grants of Grant, and was born about the year 1660. When he commenced advocate, he made a distinguished figure at the Revolution, by opposing the opinions of the old lawyers, who warmly maintained the inability of the convention of estates to make any disposition of the crown. The abilities which he discovered in favour of the Revolution introduced him to extensive practice. When the union between the two kingdoms was in agitation, Queen Anne created him a baronet, with the view of securing his interest in favour of that measure; and she soon afterwards appointed him a judge, or one of the Lords of Session. He died on the 16th March 1726. His character is drawn at great length, in the style of an *eloge*, in the *Biographia Britannica*, from which we shall only extract the following notice of his literary labours: "He was so true a lover of learning, and was so much addicted to his studies, that, notwithstanding the multiplicity of his business while at the bar, and his great attention to his charge when a judge, he nevertheless found time to write various treatises on very different and important subjects; some political, which were remarkably well timed, and highly serviceable to the government; others of a most extensive nature, such as his essays on law, religion, and education, which were dedicated to George II. when prince of Wales, by whose command his then secretary, Mr Samuel Molyneaux, wrote him a letter of thanks, in which were many gracious expressions, as well in relation to the piece as to its author. He composed, besides these, many discourses on literary subjects, for the exercise of his own thoughts, and for the better discovery of truth; which went no farther than his own closet, and, from a principle of modesty, were not communicated even to his most intimate friends." The Essays above mentioned were published at Edinburgh, in one volume octavo, in 1715.

GRANTHAM, a borough-town of the county of Lincoln, in the liberties of Grantham Soke, and parts of Kesteven. It is on the great north road, distant from London 112 miles, on the river Witham, in a healthy and fertile district. It is a corporate town, with a mayor and alderman, and returns two members to parliament. The church is a fine object, with a tower, one of the loftiest in the kingdom, being 246 feet in height. There are two charity schools in the town, at one of which Sir Isaac Newton received his first lessons. It is a place of very little trade, but has a good market on Saturday. The population amounted in 1801 to 3301, in 1811 to 3646, in 1821 to 4148, and in 1831 to 4590.

GRANVILLE, GEORGE, Lord Lansdowne, was descended from a very ancient family, derived from Rollo the first duke of Normandy. At the age of eleven he was sent to Trinity College, Cambridge, where he remained five years; but at thirteen he was admitted to the degree of master of arts, having, before he was twelve, spoken a copy of verses of his own composition before the Duchess of York, at his college, when she paid a visit to the University of Cambridge. In 1696 his comedy called the *She-Gallants* was acted at the theatre-royal in Lincoln's-inn Fields, as his tragedy called *Heroic Love* was in the year 1698. In 1702 he translated into English the second Olynthiac of Demosthenes. He was member for the county of Cornwall in the parliament which met in 1710; and afterwards became secretary of war, comptroller of the household, then treasurer, and a member of the privy council. In the year following he was created Baron Lansdowne. On the accession of King George I. in 1714, he was removed from the office of treasurer; and the next year he entered his protest against the bills for attainting Lord Bolingbroke and the Duke of Ormond. He entered deeply into the scheme for raising an insurrection in the west of England; and being seized as a suspected person, was committed to the Tower, where he continued two years. In 1719 he delivered a speech in the House of Lords against the bill to prevent occasional conformity. In 1722 he withdrew to France, and continued abroad nearly ten years. At his return in 1732 he published a fine edition of his works in two vols. quarto, and died in 1735, leaving no male issue.

GRANVILLE, a sea-port town of France, in Lower Normandy, partly situated on a rock and partly on a plain. Long. 1. 32. W. Lat. 48. 50. N.

GRANULATED, something which has undergone granulation, or has been reduced to grains.

GRANULATION, in *Chemistry*, an operation by which metallic substances are reduced into small grains, for the purpose of facilitating their combination with other substances.

GRAPE, the fruit of the vine. See VINE and WINE.

GRAPE-Shot, in artillery, is a combination of small shot, put into a thick canvass bag, and corded strongly together, so as to form a kind of cylinder, the diameter of which is equal to that of the ball adapted to the cannon. The number of shot in a bag varies according to the service or size of the guns. In the naval service, for instance, nine is always the number; but by land it is increased to any number or size from an ounce and a quarter in weight to three or four pounds. In the naval service the bottoms and pins are made of iron, whereas those used by land are of wood.

GRAPHOMETER, a mathematical instrument, otherwise called a *semicircle*, the use of which is to observe any angle, the vertex of which is at the centre of the instrument in any plane (though it is most commonly horizontal, or nearly so), and to find how many degrees it contains.

GRAPNEL, or GRAPLING, a sort of small anchor, fitted with four or five flukes or claws, and commonly used to ride a boat or other small vessel.

Fire-GRAPPLING, an instrument nearly resembling the former, but differing in the construction of its flukes, which are furnished with strong barbs at their points. These machines are usually fixed on the yard-arms of a ship, in order to grapple an adversary whom it is intended to board.

GRASS, in *Botany*, a plant having simple leaves, a stem generally jointed and tubular, a husky calyx called *gluma*, and the seed single.

GRASSE, LA, an arrondissement of the department of the Var, in France, extending over 506 square miles. It is divided into seven cantons, and sixty-three communes, and contains 56,818 inhabitants. The capital is a city of the same name, situated on the declivity of a hill, in a district which abounds in citrons, oranges, lemons, figs, and pomegranates, and in flowers used by the perfumers. It contains 2000 houses, and 12,620 inhabitants, who are much occupied in preparing liqueurs, perfumery, scented soaps, and confectionery. Near it much marble and alabaster is found. Long. 6. 50. 40. E. Lat. 43. 39. 19. N.

GRATES FOR FIRES are composed of ribs of iron placed at small distances from one another, so that the air may have sufficient access to the fuel, and the accumulation of the ashes, which would choke the fire, may be prevented. Grates seem peculiarly adapted to the use of pitcoal, which requires a greater quantity of air to make it burn freely than other kinds of fuel.

The hearths of the Britons seem to have been fixed in the centre of their halls, as is yet practised in some parts of Scotland, where the fire is nearly in the middle of the house, and the family all sit around it. Their fire-place was perhaps nothing more than a large stone, depressed a little below the level of the ground, and thereby adapted to receive the ashes. About a century ago, the fireplace was on the floor of the room, with the addition of a bank or hob of clay. But amongst gentlemen this was changed for a portable fire-pan, raised upon low supporters, and fitted with a circular grating of bars.

GRATIAN, the son of Valentinian the First by his first wife, was declared Augustus by his father at the city of Amiens in 365, and succeeded him in 367. This prince was equally extolled for his wit, eloquence, modesty, chastity, and zeal against heretics. He associated Theodosius with him in the empire, and advanced the poet Ausonius to the consulate. He made a great slaughter of the Germans near Strasburg; and was hence surnamed *Alemannicus.* He was the first emperor who refused the title of *Pontifex Maximus*, upon the score of its being a pagan dignity. He was assassinated by Andragathius in 375, in the twenty-fourth year of his age.

GRATIAN, a famous Benedictine monk of the twelfth century, was born at Chiusi in Tuscany. He employed above twenty-four years in composing a work entitled *Decretum, vel Concordantia Discordantium Canonum*, because he there endeavoured to reconcile the canons which seemed contradictory to each other. This work was first printed at Mentz in 1472. But as the learned Benedictine has frequently fallen into mistakes, both in regard to the canons and the fathers, and has often cited false decretals, several authors have endeavoured to correct his errors; particularly Anthony Augustin, in his excellent work entitled *De Emendatione Gratiani.* To the decretals of Gratian the popes principally owed the great authority which they exercised in the thirteenth and succeeding centuries.

GRATINGS, in a ship, are small edges of sawed plank, framed one into another like a lattice or prison grate, placed on the upper deck, between the main-mast and fore-mast, and serving as a defence in a close fight, as well as contributing to the convenience of the ship's company.

GRATITUDE, a virtue disposing the mind to an inward sense and outward acknowledgment of benefits received. See MORAL PHILOSOPHY.

GRATIUS, FALISCUS, a Roman poet, the contemporary of Ovid, and from his name probably a slave or freedman, but respecting whose life we have no particulars. A poem of his on hunting has been preserved, entitled *Cynegeticon*, in 540 hexameters; but its conclusion has been lost. The language is pure, and worthy of the age in which he lived, though in some passages he is obscure. Gratius seems to have imitated the work of Xenophon on the same subject, though it also contains much which can be found nowhere else. (Burmann, *Poet. Lat. Min.* tom. i.; Wernsdorf, *Poet. Lat. Min.* tom. i., in the preface "De Gratio et Nemesiano et utriusque Cynegetico Proœmium." Gratius Faliscus, *Cynegeticon*, &c. Mitau, 1775.)

GRATTAN, HENRY, an illustrious Irish orator and statesman, was born at Dublin in the year 1750. His father followed the profession of barrister, and, though not remarkable for shining qualities, was industrious and prudent. Being a Protestant, the corporation of Dublin extended to him its patronage, in consequence of which he was elected as representative of the city in parliament, and made recorder. After passing through the usual course of scholastic discipline, which he did with much reputation, young Grattan was entered as a fellow-commoner in Trinity College, Dublin. Here he also greatly distinguished himself amongst contemporaries who afterwards became the chief ornaments of the senate and the bar. His original intention was to have studied for a fellowship, but the persuasions of his relatives induced him to remove to England, where he entered himself as a student of the Middle Temple. When the requisite number of terms had expired, he returned to his native country, and in the year 1772 was called to the Irish bar. His practice seems to have been small; but that his talents had already begun to make an impression, is proved by the fact, that in 1775 he was brought into the Irish parliament under the auspices of Lord Charlemont. From this period the life of Grattan became a portion, and a very conspicuous one, of the history of his country. He joined the ranks of the opposition, and the accession of strength which it thereby acquired soon became apparent. The effect of his commanding eloquence was not confined to those who listened to it in the house. He infused the patriotic spirit, with which he was himself actuated, into the country at large. It is allowed, indeed, that the volunteer bands who had begun to assemble in various parts of Ireland, acquired new confidence from the bold, uncompromising tone assumed by the young speaker; and in the course of a few years, their ranks swelled to the number of eighty thousand men, armed, disciplined, and prepared for the field. The menacing attitude which Ireland assumed at this critical period, and the boldness with which the members of the Irish opposition, particularly Grattan, contested the supremacy of the sister kingdom, induced the British legislature, in the year 1782, to repeal the statute of the 6th of George I. By this law it had been enacted that the

Grattan.

rown of Ireland should be inseparably annexed to that of reat Britain; that Ireland should be bound by British acts f parliament, if named therein; that the Irish House of ords should have no appellate jurisdiction; and that the st appeal, in all cases of law and equity, should lie to the ritish House of Peers. For Grattan's exertions in getting is statute rescinded, his country was profuse in laudatory ldresses to him; and the parliament rewarded his serices by a grant of L.50,000. A more magnificent donation as intended, but Grattan declined to accept it. That beowed was large enough to inspire envy and provoke misonstruction. The following sessions of parliament were ormy; and the young patriot had to contend, amongst thers, with Mr Flood, an antagonist formidable alike by s acknowledged talents and the unscrupulous virulence f his attacks. The latter maintained that the act of reeal did not involve a renunciation of the British claims, nd that therefore they might be resumed and exercised t any time. This sophistry found supporters in both ouses of parliament, and the reputation of Grattan acually began to wane. But the energy and success with hich he opposed Mr Ord's celebrated propositions, rought forward in 1785, fully re-established his fame. ne of these was, that the Irish legislature should, from me to time, adopt and re-enact such statutes of the Brish parliament as related to the regulation of commerce. n opposing this proposal Grattan put forth all his powers, nd from this period he began to be acknowledged as the eader of the country party, and as the head of the Irish Whig Club. The members of this association were recirocally bound not to accept office under any adminisration which had not for its avowed principle the concedng of certain popular measures. These consisted of a bill o make the great officers of the crown responsible for heir proceedings; a bill to prevent revenue officers from oting at elections; and a place and pension bill. Several ther important subjects engaged the attention of Gratan at this period; and amongst these was the establishment of a provision for the clergy independently of tithes. He also brought in a bill to encourage the improvement f barren lands, by exempting reclaimed wastes from payng ecclesiastical dues during the space of seven years. But both these measures were rejected by the legislature, rincipally through the influence of the established church.

About the same period Grattan strenuously advocated n extension of civil rights to his Roman Catholic countrymen. That a Protestant statesman should exert himself n behalf of those who professed a religious creed different rom his own, was, at the time when Catholic emancipaion was at length conceded by the British parliament, a matter of such frequent occurrence, that no personal claim o distinction could be raised upon that ground. To enertain such sentiments was not considered as sufficient to ubject the person entertaining them to public suspicion as ne infected with pernicious opinions. But during the arly career of Grattan, the subject was viewed in another spect, and through a different medium. In Ireland, whilst he heads of the Protestant church, with the majority of the Protestants, were arrayed in opposition to any concession o the Catholics, in England the tide of vulgar prejudice an so strongly in the same direction, that a great civil conulsion had nearly arisen out of it. When these facts and ircumstances are taken into consideration, the conduct of Grattan will appear in its true light, as that of a wise tatesman, and a fearless patriot. His principal object was to obtain the elective franchise for the Catholics; but he administration of that day indignantly rejected the rayer of their petitions.

On the arrival of Earl Fitzwilliam, as lord-lieutenant, in 795, Mr Grattan attached himself to that highly popular obleman, and under his auspices originated many plans which had for their object to promote the peace and prosperity of his native land. But the recall of his lordship put a stop to all amelioration, and at the same time generated universal discontent, which was increased by the creation of new sinecures and the lavish profusion of titles. The consequences were memorable and instructive. The society of United Irishmen, whose ostensible object was reform, but who really aimed at the independence of Ireland, acquired new courage from these dissensions, and some even proposed to establish a republic in that country. The triumph of the French Revolution had no doubt inspired these daring projectors with hopes of success. A large portion of the people adopted their principles; military associations were formed, and numbers disciplined and armed; whilst an intercourse was opened with France, by which succours and assistance were liberally promised. From the commencement of the rebellion which ensued, Mr Grattan advised measures of conciliation; and when he saw that there was no hope of stemming the general movement, he withdrew from parliament, and retired to his country residence.

But the grand project of Mr Pitt for effecting a union between Great Britain and Ireland summoned him from his retirement. He obtained a seat in parliament for the express purpose of opposing that measure, which, he maintained, would prove fatal to the best interests of Ireland. Its success did not, however, prevent him from accepting a seat in the imperial parliament, and there employing his talents and eloquence for the benefit of both countries. He was chosen, in 1805, to represent the small borough of Malton; and in the year following he was returned as one of the members for Dublin. Throughout the remainder of his career, his public conduct continued to evince the purest patriotism and the most undeviating consistency, illustrated by an eloquence fraught with the finest inspirations of genius and liberty. Notwithstanding the uniform and vehement opposition of the corporation of the city which he represented, he continued to advocate the Catholic claims with equal zeal and ability. Accordingly, towards the close of his life, we find him complying with an unanimous requisition on the part of the Catholics of Ireland, to present their petition to the British parliament, and to give it his support. Some of his friends represented the fulfilment of this duty as incompatible with his health, which had now begun to decline; but he nobly replied, that "he would be happy to die in the discharge of his duty." This event did actually take place; for he expired on the 14th of May 1820, soon after his arrival in London; and his remains were interred in Westminster Abbey.

It is comparatively easy for posterity to judge for themselves of the moral and political qualities of a statesman's character, because these can be dispassionately determined from the information afforded by history as to the course of conduct which he had pursued, and the measures which he had supported. If Mr Grattan be thus estimated, he must ever be accounted one of the most ardent, consistent, and patriotic of modern statesmen. Viewing him as an orator, we can only judge of his excellence by the report of contemporaries, who but rarely agree in such matters. We are informed that he had to contend with an indifferent voice, which was thin, and, considered simply as an organ of sound, unequal to the expression of impassioned feelings. His action, too, was seldom elegant or graceful, but it possessed a far higher character; it was forcible and energetic. Animation and ardour predominated in his manner; and his pronunciation was distinct and articulate. These are the qualities which are calculated most powerfully to impress a mixed assembly; and the effects which he accordingly produced on several occasions were not surpassed by those of any orator of modern times. "With much of national peculiarity, but chiefly in the manner," says a very able writer;[1] "with much, too, of individual mannerism, his eloquence is, beyond all doubt, of a very high order. Perhaps, after making every deduction for obvious defects, he may even be accounted an orator of the first class. For he possesses an originality, and a force, rising far above any excellencies of mere composition. Fervid, vehement thoughts, clothed in language singularly pointed and terse; an extraordinary power of invective, so remarkable indeed, that he may be ranked among the greatest masters of the sarcastic style; and, above all, and it is the distinguishing character of his oratory, a copious stream of the most sagacious and original observations, or the most acute and close arguments, flowing, though not continuous and unbroken, yet with an ease the more surprising, because they almost all are in the shape of epigrams;—these are the high and rare merits which strike the reader of Mr Grattan's speeches, and must have produced a still deeper impression upon those who heard him in his prime."—"He had deep, and warm, and generous feelings, and, when roused to enthusiasm, they sometimes found vent in simple language; but his accustomed style of epigram is far more prejudicial to the expression of passion than to the conduct of an argument; and accordingly, his declamation was by no means equal to his reasoning, if we except the vituperative parts of it, which were among the finest of all his performances. He had a lively and playful fancy, which he seldom permitted to break loose; and his habits of labour were such that he abounded in all the information, ancient and recent, which his subject required, and could finish his composition with a degree of care seldom bestowed upon speeches in modern times. Finally, he was a person of undaunted spirit, and always rose with the difficulties of his situation. He was ready, beyond any man, perhaps, who ever laboured his speeches so habitually. No one ever took him off his guard. Whoever dreamt that he had caught him unawares, was speedily roused to a bitter sense of his mistake; and it is a remarkable circumstance, that, of all his speeches now preserved, the two most striking in point of execution are those personal attacks upon Mr Flood and Mr Corry, which, from the nature of the occasions that called them forth, must, of necessity, have been the production of the moment. The epigrammatic form in which he delighted to throw all his ideas, and the diction adapted to it, had become so habitual to him, that, upon such emergencies, they obeyed his call with the readiness of a natural style; and he could thus pour forth his indignation in antithesis and point, as easily as the bulk of mankind, when strongly excited, give vent to their feelings in the sort of language which, from this circumstance, we are accustomed to term the eloquence of nature or of passion.

"In the more glaring defects of what has been called the Irish School of Orators, he certainly did not abound. Extravagance of passion; strained pictures of feeling; exuberance of metaphor, and of forced metaphor; and, worse than all, excess of passion expressed by unnatural and far-fetched imagery, in language quite wide of nature, and often wholly incorrect;—from these characteristic vices of his country's fanciful and ingenious and ready orators, he was exempted beyond all his contemporaries, by the chastening effects of classical discipline. Occasionally, indeed, they do break out in his compositions; but, generally speaking, it is rather in the style than in the ideas that he departs from nature; or if in the ideas, it is in his love of point, rather than in his proneness to metaphor. In one great quality he not only stands single among his countrymen, but may be pronounced eminently superior to our own greatest orators; and it is that in which all modern compositions, those of Dante and perhaps of Milton alone excepted, fall so far short of the ancient, and especially the Greek exemplars; we mean the dignified abstemiousness, which selects one leading and effective idea, suddenly presents it in a few words, and relies upon its producing the impression desired, without saying all that can be said, and, as it were, *running down* the topic. In Mr Grattan's speeches we constantly meet with opinions delivered, or illustrations flung out, in a single sentence, or limb of a sentence, and never again recurred to, although the opinion may have been so sagacious, and the illustration so happy, that a copious modern, or even an ancient of the school of Cicero, would have worked the one into a dissertation, and the other into an allegory. This is a merit of the very highest order, subject to the remarks already made upon the difficulty of making things thus lightly touched at once perceived by an audience, and the aggravation of that difficulty by the obscurity incident to the epigrammatic style."

Mr Grattan's speeches were collected and published by his son, at London, in 1822, in 4 vols. 8vo.

GRATZ, a circle of the Austrian province of Steyermark. It extends over 2134 square miles, and contains six cities, thirty market-towns, 976 villages, with 56,362 houses, and 286,442 inhabitants. The capital, of the same name, is also the capital of the province. It stands on the river Mur, in a valley of great fertility and beauty. It is fortified, and contains 2621 houses; but the greater number of them are in the suburbs. The inhabitants are now about 40,000, having rapidly increased within the last twenty years. There are several religious houses, many churches and chapels, and a lyceum, with twenty-six professors of the various branches of science, a library of 70,000 volumes, and an observatory. There are manufactures of silk and cotton goods, and of fine articles in steel and iron, as well as of paper and hats. Long. 15. 20. 40. E. Lat. 47. 49. N.

GRAUDENZ, a city of the province of West Prussia, and government of Dantzic. It is strongly fortified, and stands on the Vistula, where there is a bridge of boats. It contains 575 houses, and, including the military in the citadel, 7572 inhabitants. It has establishments of various kinds of a charitable nature and for education, and some trade in brewing, in distilling, and in corn. Long. 18. 33. 25. E. Lat. 33. 27. 30. N.

GRAUNT, John, the author of Observations on the Bills of Mortality, and the founder of Political Arithmetic, was born at London on the 24th of April 1620, bred up in all the strictness of puritan principles, and, being designed for trade, received no more education than was barely necessary for that purpose. At an early age he was put as apprentice to a haberdasher in the city, whose trade he afterwards followed; and when he entered into business on his own account, he gained the esteem and confidence of his fellow-citizens, passed with reputation through all the offices of his ward, and was first captain and then major of the trained bands. But his genius at length prompted him to seek distinctions of a higher kind, and enabled him to overcome all the disadvantages of a confined education, to form a new and noble design, and to execute it with a degree of ability equal to the sagacity he had displayed in forming it. It is not known at what precise time he first began to collect and digest the Bills of Mortality; but it appears, from his own statement, that he had directed his attention to the subject several years before he had any design of publishing the discoveries which rewarded his researches. His book, entitled Observations on the Bills of Mortality, was published in 1661, 4to, and met with so favourable a reception that a second edition was called for the succeeding year, and others followed. Immediately after its publication, Louis XIV., by a royal ordonnance, provided that a more exact register of births and burials should be kept in Paris; and Charles II. conceived so high an opinion of his abilities, that, at the institution of the Royal Society, he recommended Graunt to the choice of the members, with this additional charge, that if they found any more such tradesmen, they should be sure to admit them. Graunt appears to have changed his religion, and become Roman Catholic, some time before his death, which took place on the 18th of April 1674. He left his papers in charge to Sir William Petty, who had all along befriended him, and who took care to adjust and insert them in a fifth edition of his work published in 1676, 8vo. The observations of Graunt may be considered as having formed the elements of that useful science afterwards styled Political Arithmetic, which, therefore, he is entitled to the honour of having founded; and whatever merit may be ascribed to Sir William Petty, Mr Daniel King, Dr Davenant, and others, there can be no doubt that the Observations on the Bills of Mortality served as the model, if not as the basis, of all their investigations. (A.)

---

[1] *Edinburgh Review*, vol. xxxviii. p. 58.

GRAVE, in *Grammar*, a species of accent opposed to acute. The grave accent is expressed thus (`); and shows that the voice is to be depressed, and the syllable over which it is placed to be pronounced in a low deep tone.

Grave, in *Music*, is applied to a sound which is in a low or deep tone. The thicker the chord or string, the graver the tone or note will be, and the smaller the more acute. Notes are supposed to be grave in proportion as the vibrations of the chord are less frequent.

Grave, in the Italian music, serves to denote the slowest movement.

Grave is also used to signify a tomb, in which a person defunct is interred. Graves, amongst the Jews, were generally without the city, though we meet with instances of their interring the dead in towns. Frequent mention is made of graves upon mountains, in highways, in gardens, and even in private houses; so that nothing on this head seems to have been fixed by any invariable usage. The same thing may be observed with respect to the Greeks. The Thebans had a law that every person who built a house should provide a burial ground. Men who had distinguished themselves were frequently buried in the public forum. The most general custom, however, was to bury without the city, chiefly by the side of the highway. The Romans were forbidden by the law of the Twelve Tables to bury or burn the dead in the city; but some, we find, had their sepulchres in Rome, though they paid a fine for this indulgence.

GRAVER, in the art of engraving, a tool by which all the lines, scratches, and shades are cut in copper, &c. See Engraving.

GRAVESANDE, William Jacob, was descended of an ancient and honourable family, and born at Delft, in Holland, on the 27th of September 1688. The name of his family was properly Storm van s'Gravesande. He studied the civil law at Leyden; but the mathematics, for which he had evinced an early inclination, were his favourite pursuit. When he had taken his doctor's degree in 1707, he settled at the Hague, where he practised at the bar, and cultivated the acquaintance of learned men. In the month of May 1713, he, in conjunction with a society of young men distinguished for their acquirements, undertook the composition of a periodical review entitled *Le Journal Littéraire*, which was continued without interruption until the year 1722. In 1715, 'sGravesande, in the capacity of secretary of legation, accompanied the deputies of the states-general, sent to London to compliment George I. on his accession to the throne; and having there formed a connection with Dr Burnet, bishop of Salisbury, he was admitted a member of the Royal Society. He returned the following year to the Hague, and, in 1715, was appointed ordinary professor of mathematics and astronomy in the academy of Leyden. During the vacations of 1721 and 1722, 'sGravesande made two journeys to Cassel to visit the landgrave of Hesse, a prince who showed an enlightened taste for experimental philosophy, and generously promoted its advancement. In 1724, he resigned the rectorship of the academy, to which he had previously been promoted, and on this occasion pronounced a discourse *De Evidentia*, which has been prefixed to the third edition of his Elements of Physics. In 1730, he added to his ordinary course civil and military architecture, which he taught in Dutch; and, in 1734, he was also appointed to teach philosophy, including logic, metaphysics, and ethics. 'sGravesande died on the 28th of February 1742, at the age of fifty-five, after a period of protracted suffering, during which he preserved unimpaired all his characteristic vivacity. His principal works are as follow, viz. 1. Essai de Perspective, Hague, 1711; 2. Physices Elementa Mathematica, experimentis confirmata, sive Introductio ad Philosophiam Newtonianam, Hague, in two vols. 4to; 3. Philosophiæ Newtonianæ Institutiones in usus academicos, an abridgment of the preceding, Leyden, 1723, 1728, and 1744; 4. Matheseos Universalis Elementa, quibus accedunt, specimen commentarii in Arithmeticam universalem Newtoni, et de determinanda forma seriei infinitæ adsumtæ Nova Regula, Leyden, 1727, in 8vo; 5. Introductio ad Philosophiam, Metaphysicam et Logicam continens, Leyden, 1736, 1737. In the *Dictionaire Historique* of Prosper Marchand may be found a detailed biography of 'sGravesande by Allemand, the editor of the work, who was intimately connected with 'sGravesande and his family.

GRAVESEND, a market-town of the county of Kent, in the hundred of Toltingtrough, of the lathe of Aylesford, twenty-three miles from London. It is situated on the south bank of the river Thames, from which the principal street ascends up a gentle hill. It depends chiefly on the ships which resort to the port of London, as at the custom-house all vessels report their arrival, and outward bound ships receive their clearances. There are strong batteries above and below the town, which defend the passage, in conjunction with Tilbury Fort, opposite the town, on the Essex shore. There is a constant, almost hourly, intercourse with the metropolis by steam, and other passage boats, which find ample employment in conveying the numerous pilots, custom-house officers, masters of vessels, merchants, and seamen, backwards and forwards. The soil round the town is favourable for gardens, and the supply of vegetables to ships departing is amply furnished; and this, with the sale of poultry, fresh butter, eggs, and meal, is a source of profit to the inhabitants. A little below the town, establishments have been formed of late years for bathing, as the river, with the flood tide, is perfectly salt. The great road to Dover passes the end of the town, and contributes in some degree to its prosperity. It is a corporate borough, governed by a mayor, twelve jurats, and twenty-four common councilmen, who have an elegant town-hall, but return no members to parliament. The church is a modern building, erected, under the act of Queen Anne, for building fifty churches, in 1731. There is a good market on Saturday. The population amounted in 1801 to 2483, in 1811 to 3119, in 1821 to 3814, and in 1831 to 5097.

GRAVINA, John Vincent, one of the most distinguished men of letters that the kingdom of Naples ever produced, was born at Rogiano, a small town near Cosenza, in Calabria-Ulteriore, on the 20th of January 1664. His parents, who, by their station and their fortune, held the first rank in the place, neglected nothing to promote his early education; but the precocity of mind, the vivacity of imagination, and the ardour to instruct himself evinced by their son, soon made them sensible that he required other cares at their hands, and needed to be restrained rather than stimulated. Gregorio Caloprese, his uncle, after having cultivated, with success, at Naples, poetry and philosophy, had retired to his native place, Scalea, a maritime city in that part of Calabria. The education of a nephew, who inspired so high hopes, appeared to him an agreeable task, and he willingly undertook it. Under the auspices of his uncle, young Gravina learned Latin, rhetoric, history, and the principles of geometry; acquisitions well calculated to pave the way for the study of philosophy, which was then beginning to cast off the yoke under which it had languished in the schools. Thus occupied, Gravina attained his sixteenth year, when Caloprese, finding that the education of his nephew, on which he had bestowed so great care, required his removal to another and wider field, desired to conduct him to Naples; but some domestic embarrassments obstructed the proposed arrangement, and the young student might have been left to his fate, had not his generous relation taken on himself the expense of carrying this proposal into effect, and sent him to the capital, with a strong recommendation to Seraphino Biscardi of Cosenza, then considered as the head of the Neapolitan bar. Charmed with the dispositions evinced by Gravina, Biscardi divided his attentions between him and Cajetano Argentio, particularly directing the application of the former towards Greek, in which he had only received a few lessons from his uncle, but of which he soon acquired a perfect knowledge under Gregorio Massere, then regarded as the first Hellenist of Naples. In the mean time Biscardi taught them all the secrets of the art of oratory, not forgetting that of declamation; but Gravina, who at the same time cultivated poetry, did not so far abandon this pursuit as to devote himself exclusively to the study of eloquence. It was about this time in fact that he composed, on the subject of the Passion, a drama, entitled *Tragedia di Cristo;* a piece which has not been printed, but which he most probably translated, with some additions, from the Greek drama of the same name attributed to Gregory of Nazianzen. Of another drama also composed by Gravina, there remains only the title, *Sant' Atanasio.* As the relations of Gravina had destined him for the profession of the law, the time was now approaching when it would be necessary to make jurisprudence a serious study; but for that science he had conceived an aversion which appeared to be insurmountable. The barbarous language of chicane, as he considered the technical nomenclature of the law, appeared to him an offence committed against the worship of the muses, and the riches which the bar often produces, a sordid means of existence. Biscardi had much difficulty in convincing him of the difference which exists between the science of laws, and the mere conduct of processes, or ordinary practice. He repeated, for some time in vain, that this science rests on a profound knowledge of the classics; and that, if modern jurisconsults had corrupted the Latinity of the schools, it might still be brought back to the standard of the purer ages of Alciat and Cujas. The prejudices of Gravina at length vanished; he applied himself vigorously to the study of the civil and canon law, and at the same time extended his knowledge of theology by an attentive perusal of the works of the Fathers. He sought the conversation of the learned, and continually studied the five books which he regarded as the sources of the knowledge to which he aspired; we mean the Holy Scriptures, the body of the civil law, the works of Plato, those of Cicero, and the poems of Homer. Gravina had long desired to visit Rome; but his uncle, Caloprese, who still superintended his education, opposed his wish until he should have completed his course of study. When this was accomplished, he repaired to the ancient capital of the world in 1689. Paolo Coardo, of Turin, afterwards chamberlain to Clement XI. received him into his house, where he remained several years, and also procured him the acquaintance of the most celebrated men of their time, Ciampini, Fabretti, Bianchini, Buonaroti, Emmanuel Martino, and Father Miro. In conversation, they were accustomed to discuss the most important questions; and as it often turned upon the relaxation of morals, Gravina undertook to treat this subject, applying to it the theological knowledge which he had acquired in the course of his studies. Accordingly, in 1691, he published, under the supposititious name of Priscus Censorinus, a dialogue, entitled *De corrupta Morali Doctrina,* Naples, 4to, the object of which was to prove that the corrupters of morals do more injury to the church than the boldest heresiarchs. Gravina was then only twenty-six years of age. But the eloquence of the style and the solidity of the reasonings ensured the success of the book, which at the same time excited lively dissatisfaction amongst the numerous partisans of convenient doctrines and loose practice. Father Concina has inserted this dialogue almost entire in his treatise *De Incredulis.* Nor did poetry escape the contamination which had so deeply infected morals. A single writer, Alessandro Guidi, a friend of Gravina, struggled at Rome against the prevailing debasement of taste, and, at the request of Christina, queen of Sweden, had, under the Arcadian name of Erillo Cleoneo, written a comedy, entitled *Endimione.* As this piece became the object of the most virulent attacks, Gravina, under the name of Bione Crateo, undertook the defence of his friend, which he read in a literary assembly, and which was afterwards printed under the title of *Discorso sopra Endimione,* Rome, 1692. This little work, in which he laid down excellent principles, drew upon the author new adversaries, who considered it equally strange and unpardonable that Gravina should attempt to constitute himself at once the censor of morals and the reformer of taste. A jealousy, almost amounting to fury, was excited against the young Neapolitan; whilst his disposition to censure the works of others, and the confidence which he appeared to repose in his own opinions, were but little calculated to calm the spirits of his enemies. Gravina sometimes commended, but he more frequently censured, and his decisions were often expressed in contemptuous terms. This tendency made him a host of enemies. His least actions were watched in order to calumniate him, and he was assailed with the most malignant invectives. Then appeared in succession, under the name of Quintio Settano, the Arcadian *alias* of Ludovico Sergardi, sixteen satires against Philodemus, the name under which Gravina was therein designated. These satires, which were equally spirited and bitter, obtained great success, and were circulated in profusion. Gravina at first affected indifference. It is a fault of the age, said he, to take pleasure in outraging merit. But as this tranquillity did not reduce his enemies to silence, he could no longer restrain his resentment, and composed some declamations of the nature of *verrine,* and also some iambics; but he has not published these retaliatory effusions, probably because he thought them inferior to the satires of Settano. The malignity of the enemies of Gravina did not lessen the esteem which he had inspired, nor abate his zeal for useful and wholesome pursuits. He united with several other literary men who had associated together for the purpose of cultivating poetry in silence. There were only fifteen of them, but their number soon increased, and Gravina assembled them for the first time, in November 1695, at a house which he had provided for the purpose on Mount Janiculum. They framed for the association a democratic constitution, and took the name of *Arcadi,* or Arcadians. In summer, they were to assemble in the gardens, and there invoke the Muses; and, by their manner of living and the simplicity of their writings, they were to endeavour to imitate the ancient shepherds, without distinction of rank or fortune. Each assumed a pastoral name. As the number of members increased, it became necessary to give laws to the association, and decemvirs were named for the purpose of preparing them. Called to discharge this duty, Gravina reviewed the numerous and incoherent regulations adopted by the Arcadians, and reduced them into a single code. These laws, written in Latin, with an elegant conciseness, and rare propriety in the selection of terms, in imitation of those of the Twelve Tables, soon spread throughout Europe, and were universally admired. Lastly, on the 20th of May 1696, the *Arcadi* held a general assembly on the Palatine Hill. Gravina, after an eloquent discourse, presented the marble tablets containing the laws, which he established with the expressions consecrated in the Roman jurisprudence, and on this occasion also he assumed the name of Opizio Ermanteo. During this period, Gravina had composed several dissertations, which he collected under the title of *Opuscula*, Rome, 1696, and in which are included, 1. Specimen prisci Juris; 2. De Lingua Latina dialogus; 3. Epistola ad Gabrielem Reignerium à Gallum; 4. De contemptu Mortis; 5. Epistola ad Trojanum Mirabellam; and, 6. Delle Favole Antiche, which has been translated into French by Joseph Regnauld. After the death of Alexander VIII. Antonio Pignatelli, having obtained the pontifical throne under the name of Innocent XII. wished to raise Gravina to the highest ecclesiastical honours; but the latter refused to embrace the clerical profession, as all his ambition was confined to teaching the laws, and his taste led him towards profane erudition. Nor was his ambition disappointed. In 1699, he obtained the chair of civil law, and in his opening discourse traced the history of that science; whilst, in order to make his system of instruction better known, he composed the treatise *De Instauratione Studiorum*, which he dedicated to the new pontiff. The discourse *De Sapientia*, which he delivered in 1700, also relates to the same subject. In that one which is entitled *Pro Legibus ad magnum Moschorum regem*, after speaking of the pre-eminence and dignity of the Roman laws, he considers them in reference to the influence which they were likely to have in the civilization of the states of the czar, Peter the Great. The subjects of the other dissertations of Gravina we need not indicate, as they have been collected in his works. We shall merely refer to that one on the *internal rule*, because it makes known the religious sentiments with which the mind of this great civilian was deeply imbued. In 1703, Gravina passed from the chair of civil to that of canon law. From the commencement of his career as a public instructor he had abolished the usage of scholastic argumentation; and each succeeding year brought some useful change. He thought that the only means of establishing sound doctrine was to ascend to the sources or fountain-head of the laws; and this accordingly is the object of his treatise *De repetendis Doctrinarum Fontibus*. But these little treatises, which he composed with extreme facility, did not prevent him from continuing his great work, *De Ortu et Progressu Juris Civilis*, the first book of which appeared at Naples in 1701, and the whole was completed in three books, and printed in 1713. Europe resounded with the praises bestowed on this great work; the celebrated Maffei made an abridgment of it; and it was reprinted several times in different places. The writings of Gravina attest the extent of his knowledge, and his ardour in the cause of education; but the greatest proof of his general zeal and discrimination consists in giving to literature Metastasio, who owed to him his education and his fortune, and who, in his writings, particularly in his poetry, takes pleasure in acknowledging the gratitude he owed, not only to the beneficence, but still more to the instructions of his adoptive father. During the period which elapsed from 1711 to 1714, Gravina completed and published several works, particularly his Discourses, his book *De Romano Imperio*, Naples, 1712, in 12mo; his tragedies, *Palamede*, *Andromede*, *Appius Claudius*, *Papinianus*, and *Servius Tullius*, Naples, 1712, in 12mo; and his treatises, *Della Ragione Poetica*, Rome, 1708, and *Della Tragedia*, Naples, 1714, in 4to. Gregorio Caloprese died at Scalea in the summer of 1714. As soon as Gravina heard of his illness, he hastened to pay his last duties to a relation to whom he lay under so many obligations. He passed nearly two years in Calabria, and it was not until 1716 that he returned to Rome, where he died on the 6th of January 1718, leaving to his mother, Anna Lombarda, the property which he possessed in Calabria, and to Metastasio all that he had acquired at Rome, excepting some legacies to his other pupils, Giuliano Pier-Santi, Lorenzo Gori, and Horazio Bianchi, all men of reputation in letters. The works of Gravina have been collected in three volumes, under the title of *Opere del Gravina*, Leipsic, 1737, in 4to, and Naples, 1756, with notes by Mascovius the editor. (A.)

Gravina, a city of the province of Bari, in the kingdom of Naples. It is a rocky height, watered at its foot by the rivers Casale and Gravina. It contains 8693 inhabitants, who are employed in cultivating wheat and aniseseed, and in preparing saltpetre.

GRAVITATION, in *Natural Philosophy*, signifies either the force by which bodies are pressed towards the surface of the earth, or the manifest effect of that force; in which last sense the word has the same signification with *weight* or *heaviness*.

GRAVITY, Specific, denotes the weight belonging to an equal bulk of every different substance. Thus the exact weight of a cubic inch of gold, compared with a cubic inch of water, tin, lead, or any other substance, is called its *specific gravity*.

GRAY, or Grey, a mixed colour partaking of the two extremes of black and white. See Dyeing.

Gray, *Lady Jane*. See Grey.

Gray, *Thomas*, an eminent English poet, was the youngest and only surviving son of Philip Gray, a citizen and money-scrivener of London, and was born in Cornhill, on the 20th of December 1716. He was educated at Eton, where he contracted a friendship with Horace Walpole, afterwards Earl of Orford, and with Mr Richard West, son of the Lord Chancellor of Ireland. Mr West and Mr Gray were both intended for the bar; but the former died early in life, and the latter was diverted from that pursuit by an invitation to accompany Mr Walpole in his travels, which he accepted, without any fixed plan for his future life. During his travels, which included the customary tour through France and Italy, he wrote a variety of letters to Mr West and to his parents, which are printed with his poems, and full of interest. Architecture, Gothic as well as Grecian, painting and music, with the manners and customs of the people, were all studied by him with success. But, whilst at Reggio, an unfortunate difference took place between him and Walpole, and they parted in mutual displeasure. A great deal has been said of this quarrel, but the real cause of it has never been sufficiently explained. Walpole, however, affected to take the blame on himself, and in doing so he was very probably right. On his return, Gray finding himself in narrow circumstances, yet with a mind indisposed to active employment, retired to Cambridge, where he devoted himself to study; and soon afterwards his friend West died. The melancholy impressed on him by this event may be traced in his admired Elegy written in a Country Churchyard; which is believed to have been begun, if not finished, about this time, though the conclusion, as it stands at present, is certainly different from what it was in the original manuscript copy. The first impulse of his sorrow for the death of his friend gave birth to a tender sonnet in English, written on the model of Petrarch; and also to a sublime apostrophe in hexameter verse, with which he intended to commence one of his books *De Principiis Cogitandi.*

From the winter of the year 1742 till the day of his death, his principal residence was at Cambridge, whence he seldom was absent for any considerable time, except between the years 1759 and 1762, when, on the opening of the British Museum, he took lodgings in Southampton Row, in order to have access to the Harleian and other manuscripts there deposited, from which he made several curious extracts, amounting in all to a tolerably sized folio volume.

About the year 1747, Mason, afterwards the editor of his poems, was introduced to Gray. The former had written, a year or two before, some imitations of Milton's juvenile poems, particularly a Monody on the Death of Pope, and two pieces entitled *Il Bellicoso* and *Il Pacifico*, on the peace of Aix-la-Chapelle; and the latter had revised them at the request of a friend. This laid the foundation of an intimacy which continued without interruption until the death of Gray.

About the year 1750, Mr Gray having put the last touches to his Elegy written in a Country Churchyard, communicated it to Walpole, who was too much charmed with it to withhold it from his acquaintance. Accordingly it was shown about for some time in manuscript, and received with all the applause which it so justly merited. At last the publisher of one of the magazines having surreptitiously obtained a copy, Gray wrote to Walpole, desiring that he would put the manuscript into the hands of Mr Dodsley, and order him to print it immediately. This proved the most popular of all our author's publications. It passed through eleven editions in a very short space of time, and was translated into Latin, first by Ansty and Roberts, and afterwards by Lloyd.

From July 1759 till the year 1762, Gray resided generally in London, with the view, as we have already mentioned, of having more ready access to the British Museum. In the summer of 1765 he undertook a journey to Scotland for the benefit of his health, which was then in a precarious state, and having passed through Edinburgh and Perth, he proceeded to Glammis Castle, the seat of Lord Strathmore, where he resided for some time; after which he visited the north, where he formed an acquaintance with Dr Beattie, then but little known beyond the immediate circle of his friends at Aberdeen. Gray's account of this journey is praised by Dr Johnson as curious and elegant; "for," says the doctor, "as his comprehension was ample, his curiosity extended to all the works of art, all the appearances of nature, and all the monuments of past events." Part of the summers of 1766 and 1767 he passed in journeys in England; and he had intended to make a second tour in Scotland, but returned to London without accomplishing his design. In July 1768 his grace the Duke of Grafton wrote him a polite letter, informing him that his majesty had been graciously pleased to offer to him the professorship of modern history in the university of Cambridge, then vacant by the accidental death of Mr Brocket. This place was valuable in itself, as the salary amounted to L.400 a year; but what rendered it particularly acceptable to Mr Gray was its being given him without solicitation. He was indeed remarkably disinterested or indifferent about money in all his pursuits. Though his income, before this addition, was but small, he never read or wrote with a view of rendering his labours useful to himself. He may be said to have been one of the few personages connected with literature, especially the poetical department, who are devoid of selfishness, and at the same time attentive to economy; and he was also amongst mankind in general one of those rare economists, who possess that talent, untinctured with the slightest stain of avarice. When his circumstances were at the lowest, he gave away such sums in private charity as would have done credit to an ampler purse. But what chiefly deterred him from seeking any advantage by his literary pursuits, was a certain degree of pride, which led him to despise the idea of being thought an author by profession.

It is probable, however, that early in life he had an intention of publishing an edition of Strabo; for his papers contain a great number of notes and geographical disquisitions on that author, particularly respecting that part of Asia which comprehends Persia and India. The indefatigable pains which he had bestowed on the writings of Plato, and the quantity of critical as well as explanatory observations which he left upon almost every part of that ancient philosopher's works, plainly indicate that no man in Europe was better prepared to republish and illustrate them than Mr Gray. Another work, on which he had bestowed uncommon labour, was the *Anthologia.* In an interleaved copy of that collection of Greek epigrams, he has transcribed several additional ones, which he selected in his extensive reading, inserted a great number of critical notes and emendations, and also subjoined a copious index. But whether he intended this performance for the press or not, has not been ascertained. The only work which he meditated with a direct view to publication from the beginning, was a history of English Poetry, upon a plan sketched out by Pope. He has mentioned this himself in an advertisement to the three fine imitations of Norse and Welsh poetry which he gave the world in the last edition of his poems. But after he had made considerable preparations for the execution of this design, and Mason had proffered his assistance, he was informed that Mr Wharton, of Trinity College, Oxford, was engaged in a work of the same kind. The undertaking was therefore relinquished by mutual consent; and soon afterwards, upon that gentleman desiring a sight of the plan, Gray readily sent him a copy of it.

Amongst other sciences which he cultivated, Gray had acquired a great knowledge of Gothic architecture. He had seen and accurately studied on the spot, whilst abroad, the Roman proportions, both in ancient times, and in the works of Palladio. In his later years he applied himself to study those stupendous structures of more modern date which adorn our own country, and which, if they have not the same grace, undoubtedly possess at least equal dignity, with those of ancient times. He endeavoured to trace this mode of building from its commencement through the various changes it underwent, until it arrived at its perfection in the reign of Henry VIII. and ended in that of Elizabeth. For this purpose, he did not so much rely upon written accounts, as on that internal evidence which the buildings themselves exhibit of their respective antiquity; since they constantly furnish to the well-informed eye, arms, ornaments, and other marks, by which their several ages may be ascertained. On this account he applied himself to the study of heraldry as a preparatory science; and he has left behind him a number of genealogical papers, more than sufficient to prove him a complete master of that subject. By these means he attained such prompt sagacity in architectural matters, as to be enabled to pronounce, at first sight, the precise time when every particular part of any of our cathedrals was erected. But the favourite study of Gray for the last ten years of his life was natural history, which he then rather resumed than commenced; for, by the instructions of his uncle Antrobus, he was a considerable botanist at the age of fifteen. The marginal notes which he has left on Linnæus and other writers on the vegetable, animal, and fossil kingdoms, are very numerous; but the most considerable are those on Hudson's *Flora Anglica*, and the tenth edition of the *Systema Naturæ*, which he interleaved and filled almost entirely. Whilst employed on zoology, he read with great care Aristotle's treatise on that subject, and explained many difficult passages of that obscure ancient, by the lights he had received from modern naturalists. In a word, excepting pure mathematics, and the studies dependent on that science, there was hardly any branch of human learning in which he had not acquired a competent skill, and in most of them a consummate mastery. To this account of his literary character we may add, that he had a fine taste in painting, prints, gardening, and music; and was moreover a man of good breeding, as well as of virtue and humanity.

Gray died in 1771; and an edition of his poems, with memoirs of his life and writings, were published by Mr Mason in 1775, 4to. This gentleman, however, instead of employing his own pen in delineating the character of Gray, has adopted one drawn by the Reverend Mr Temple, rector of Mamhead in Devonshire, and communicated in a letter to Mr Boswell. "Perhaps," says Mr Temple, "he (Gray) was the most learned man in Europe. He was equally acquainted with the elegant and profound parts of science, and that not superficially, but thoroughly. He knew every branch of history, both natural and civil; had read all the original historians of England, France, and Italy; and was a great antiquarian. Criticism, metaphysics, morals, politics, made a principal part of his plan of study; voyages and travels of all sorts were his favourite amusement; and he had a fine taste in painting, prints, architecture, and gardening. With such a fund of knowledge, his conversation must have been equally instructing and entertaining; but he was also a good man, a well-bred man, a man of virtue and humanity. There is no character without some speck, some imperfection; and I think the greatest defect in his was an affectation in delicacy, or rather effeminacy, and a visible fastidiousness, or contempt and disdain of his inferiors in science. He also had, in some degree, that weakness which disgusted Voltaire so much in Mr Congreve: though he seemed to value others chiefly according to the progress they had made in knowledge, yet he could not bear to be considered himself merely as a man of letters; and though without birth, or fortune, or station, his desire was to be looked upon as a private independent gentleman, who read for his amusement. Perhaps it may be said, what signifies so much knowledge, when it produces so little? Is it worth taking so much pains to leave no memorial but a few poems? But let it be considered that Mr Gray was, to others, at least innocently employed; to himself, certainly beneficially. His time passed agreeably; he was every day making some new acquisition in science; his mind was enlarged, his heart softened, and his virtue strengthened; the world and mankind were shown to him without a mask; and he was taught to consider every thing as trifling, and unworthy the attention of a wise man, except the pursuit of knowledge, and the practice of virtue in that state wherein God hath placed us."

The more recent, and perhaps also the more valuable editions of the collected works of Gray, are, 1. That by Thomas James Mathias, London, 1814, in 4to; and, 2. That by the Rev. John Mitford, London, 1816, in two vols. 4to. The edition of Mathias, besides the poetical works of Gray, contains Memoirs of his Life and Writings, including his correspondence, by Mason, together with extracts, philological, poetical, and critical, from the author's original manuscripts. In the edition of Mitford the poems are accompanied and illustrated with critical notes, and to them are prefixed a Life of the author, and an Essay on his Poetry.

GRAZALEMA, a city of Spain, in the province of Granada. It is a romantic place, of Moorish building, partly on the side and partly on the summit of a lofty hill in the Sierra de Ronda, and contains 5000 inhabitants, who are occupied in making coarse woollens.

GREAT, a term of comparison, denoting that one thing has more extension than some other to which it is referred. Thus we say, a *great* space, a *great* distance, a *great* figure, a *great* body, and the like.

GREAT is likewise used figuratively in matters of morality, &c. to signify ample, noble, elevated, extraordinary, important, and the like. Thus we say, Shakspeare was a *great* genius, Da Vinci a *great* painter, Galileo a *great* philosopher, Bossu a *great* critic, and so on.

GREAT is also a title or quality appropriated to certain princes and other illustrious personages. Thus we say, the *great* Turk, the *great* Mogul, the *great* Khan of Tartary, the *great* Duke of Florence.

GREAVES, JOHN, an eminent mathematician and antiquary, was the eldest son of John Greaves, rector of Colemore, near Alresford in Hampshire, and born in 1602. He was educated at Baliol College, Oxford, from which he removed to Merton. He was afterwards, on the ground of merit, chosen professor of geometry in Gresham College. His ardent thirst of knowledge soon led him to visit several parts of Europe, where he eagerly availed himself of every opportunity to improve it. His travels were next into the countries of the East, where nothing remarkable seems to have escaped his observation. With indefatigable industry, and even at the peril of his life, he collected for Archbishop Laud a considerable number of Arabic, Persic, and Greek manuscripts, of which he well knew the value, as he was a master of the languages in which they were written. He also collected for that prelate many oriental gems and coins. He made a more accurate survey of the pyramids of Egypt than any traveller who had preceded him, and afterwards digested his observations in a work on that subject. On his return from the East, he visited a second time several parts of Italy; and during his stay at Rome instituted inquiries into the ancient weights and measures. Soon after his return he was appointed to the Savilian professorship of astronomy at Oxford; an office for which he was eminently qualified, as the works of the ancient and modern astronomers were alike familiar to him. But, after enjoying this preferment for some time, Greaves was deprived of it by the parliamentary visitors, on account of his strong royalist predilections, and died on the 8th of October 1652, of a fatal disorder, which appears to have been brought on by excessive application. Besides his papers in the Philosophical Transactions, the works of Greaves printed separately are, 1. *Pyramidologia*, or a description of the Pyramids in Egypt, London, 1646, in 8vo; 2. A Discourse of the Roman Foot and Denarius, ibid. 1649, in 4to; 3. Elementa Linguæ Persicæ, ibid. 1649, in 4to; 4. Epochæ celebriores Astronomis, Historicis, Chronologis Chataiorum, Syro-Græcorum, Arabum, Persarum, &c. usitatæ, ex traditione Ulug Beig, Arab. et Lat. London, 1650, in 4to; 5. GREECE.

Greece.

Introductory observations.

Greece and its inhabitants, after a long period of oblivion, have at length become objects of profound and general interest to the most enlightened nations of Europe. It was singular, indeed, that whilst classical scholars were immersed in the study of its poets, orators, and historians, the country that gave birth to so many literary treasures, though neither distant nor inaccessible, seemed to have been as completely forgotten, as if it had been blotted from the map of Europe. The learned contented themselves with supposing that the modern country was inhabited by rude and unknown tribes, governed by fanatical Turks, whose barbarous rule exposed travellers to continual insults and pillage, and had swept away all traces and memorials of the ancient glory of Greece. Besides, the country was not known to be distinguished by its natural beauties; and being confounded with the torpid mass of the Ottoman empire, its political importance was reduced to nothing. Till a very late period, the only intelligible accounts we had of the country were drawn from Strabo and Pausanias. The inquiries of Spon and Wheler, Le Roy, and Stuart, which at length brought some of its precious antiquities to light, were chiefly addressed to artists and scholars. Chandler's Travels were not much better adapted for general use. But the work which, more than any other, contributed to render all subjects connected with Greece and its antiquities popular, was the *Travels of Anacharsis*. Previous to the appearance of this work, however, various circumstances had contributed to bring the Greeks more conspicuously forward on the theatre of European affairs. While the general diffusion of education was increasing the number of those who felt an interest in classical subjects, the rise of the power of Russia, the connection she endeavoured to form with the Greeks, and her projects against Turkey, held out a probability that Greece might speedily regain some share of political importance. The Greeks themselves, by the desperate efforts they made in 1770, and again in 1790, gave a proof to the world, that their existence as a people, and their national feelings, had survived those destructive revolutions which were supposed to have overwhelmed them. When the political enthusiasm created by the French Revolution made the most gigantic plans of political change appear easy, the emancipation of this long neglected country from the Turkish yoke was looked to as one of the most certain and gratifying triumphs of the new principles. Before the interest arising from this state of things had expired, circumstances of a different kind directed public attention more immediately to Greece. The host of English travellers who had been accustomed to roam over the Continent, shut out from their usual routes by an extraordinary combination of events, were forced into less frequented tracts, and numbers of them visited Greece. By these, and by a few individuals from other parts of Europe, a great part of the country has been explored, and a vast mass of information given to the public. Its topography and statistics are now better known than those of many of the nearer and more accessible parts of Europe; the classical interest of the country has been augmented tenfold, by vivid descriptions of its monuments and its scenery; and the stirring events of the revolution lately completed, have greatly strengthened its claims to the attention and the sympathies of western Europe. It is now found that the modern Greeks, instead of being the mixed progeny of obscure and barbarous tribes, possess a respectable degree of civilization, and great capacities of improvement; that they have preserved the features and national character of their ancestors with surprising distinctness; and that their dialect does not deviate much farther from the language of Plato and Demosthenes, than that of Chaucer does from the English of the present day. Independently, too, of its other attractions, Greece surpasses Italy, and perhaps every other country in the world, in the beauty of its scenery. Its antiquities are not, like those of the latter country, accumulated chiefly upon a single spot. They are scattered over a wide surface, associated with a variety of scenery, and present memorials of many separate communities, distinguished by differences of character, habits, and civilization. Its monuments, compared with those of Rome, breathe a purer taste, a finer moral spirit, and bespeak a sublimer genius; they tell of brighter and better times, of characters and actions more surprising, generous, and romantic. Some of them transport the mind back to those remote times where truth and fable are blended,—to those delightful fictions which bear the impress of the genius of the people more distinctly than the real events of their history. No country, in short, presents greater attractions to a well-informed traveller; and as, in future, it will certainly be included in every classical tour, we may reasonably expect that, in a short time, every part of it will be completely explored.

In this article we shall first describe Greece in its full extent, according to the boundaries recognised in ancient times by the Greeks and Romans. We shall then give a brief sketch of the history of the late revolution; and conclude by a statistical view of the new state, which forms only a portion of ancient Greece.

The reader is therefore to understand, that this article consists of two parts. The *first* applies to the portion of Greece still ruled by the Turks, but alludes occasionally to the districts forming the new state, as they existed before the revolution. The *second* relates exclusively to the latter districts, that is, to Independent Greece, of which Otho is now king. The arrangement is inconvenient, but unavoidable, as the new state comprises only one third of the country, and the condition of the people is so much alike in both parts, that in the description of arts, manners, &c. they could not be properly separated. The history of the several ancient states will be found in other parts of this work, under their respective heads.

Name.

The name of Greece was originally restricted to a small territory northward of the Gulf of Corinth, called also Hellas. Afterwards it included Attica, Eubœa, Peloponnesus, Epirus, and Thessaly; and ultimately Macedonia and Crete. In the brilliant periods of Grecian history, the extent of the country might be considered as coincident with the limits of those states which sent deputies to the Amphyctionic Council, and in this sense Ætolia and Acarnania, as well as Epirus, Macedonia, and Crete, ought to be excluded.[1] But, though we shall notice these divisions, our object at present is rather to take the appellation in its most extensive sense, and to follow what may be considered the natural limits of the country; because the territories included within these limits are associated by certain political relations; and because many of the most interesting subjects of inquiry and discussion relating to the ancient, and still more to the modern state of Greece, connect themselves most naturally with this arrangement.

Extent.

The continent of Greece, including Albania and Mace-ce.

---

[1] Cellarii *Geog. Antiq.* lib. ii. cap. 18; Strabo, lib. viii.; Potter's *Antiq.* b. i. chap. 16.

onia, is nearly shut in on the north by a chain of moun- ins known anciently by the names of Rhodope, Scomius, nd Orbelus;[1] it is bounded on the west by the Adriatic nd Ionian Seas, on the south by the Mediterranean, and n the east by the Ægean Sea, or Archipelago. It extends rom 36. 10. to 42. 40. of north latitude; and from 19. 45. o 24. 40. of east longitude from London. Its length, from ape Matapan to Mount Orbelus, or Argentaro, is 450 nglish miles; its greatest breadth, from Durazzo to Ca- ale, at the foot of Mount Pangœus (a branch of Rhodope), 35 miles; and it embraces an area of 57,750 square miles, xclusive of all its islands except Eubœa. But, as our leas of the extent of the country have always a reference o those ancient states which comprised but very minute ortions of its surface, it is necessary that its dimensions hould be described more in detail.

nd ns.

The country recognised as Greece before the rise of e Macedonian power, comprehended the Morea or Pelo- onnesus, Attica, Eubœa, Bœotia, Phocis, Doris, Ætolia, carnania, Thessaly, and Magnesia; and even several of e states included within these limits had little or no share n those splendid actions which have shed so much glory ver the country. The surface of Peloponnesus, which ncluded seven different states, is about 8950 square Eng- sh miles in Danville's map; that of the countries just amed, without the peninsula, including Eubœa, is 14,800; nd both together amount to 23,750 square miles; an ex- ent of surface not exceeding two fifths of England, or ne fifth of the British isles. If to this we add 16,000 quare miles for Albania or Epirus (including the basin of e Drino), 18,000 for Macedonia, and 1000 for the Cy- ades, the whole surface of Greece and its islands will be 8,750 square miles, which is almost exactly the area of ngland. While Greece preserved its independence, how- ver, all these territories were never united into one body olitic, nor was their confederated force ever applied to the rosecution of any common enterprise. The communities hose warlike achievements and brilliant career in arts nd philosophy raised the Grecian name so high, occupied ut very minute portions of the country; as the follow- g table, deduced from measurements on D'Anville's map, ill show.

	Eng. Sq. Miles.
ttica, including Megaris and Salamis, but not Eubœa[2]	1190
œotia	1530
aconia (without Messenia)	1720
chaia (the twelve cities with their territories)	1140

These states, therefore, were in general about equal in xtent to middle-sized English counties. None of them as so large as Norfolk or Devonshire; and the two ad- oining counties of York and Lancaster were nearly equal o the whole seven states of the ancient Peloponnesus. ttica, indeed, besides possessing at one period Eubœa, ad many colonies in the Cyclades, Thrace, and other arts; and Sparta held Messenia long in subjection; but, n great struggles, these colonies and dependencies often hook off their allegiance, and the parent state was obliged o rely on its own resources. Such was the energy of ese small communities, that Attica, which scarcely sup- orts, at present, a miserable population of 20,000 souls, ent out sometimes colonies of 10,000 men at once (Diod. ic. lib. ii.); and Sparta furnished 50,000 soldiers to fight the ersians at Platæa. The territories of Corinth, when she formed a separate state, were much smaller than any of these; her wealth and power depending chiefly on commerce.

Greece.

Gulfs and mountains.

Greece forms a long and rather narrow peninsula, singularly indented on three sides by arms of the sea, and having a greater proportion of its surface occupied by mountains than any other country in Europe of equal extent, except Switzerland. It has been justly observed, that those physical features which distinguish Europe from the other quarters of the world belong in a peculiar manner to Greece, and distinguish it in the same proportion from the other parts of Europe. Of these arms of the sea, the most considerable are the Gulfs of Contessa, Salonica, Volo, Ægina, and Nauplia, on the east; those of Kolokythia and Coron on the south; and those of Lepanto and Arta on the west. Of the mountains, the first in order are those which pass along the northern frontier. Mount Argentaro, the ancient Orbelus, placed at the northern extremity of Greece, near the forty-third degree of latitude, may be considered as the centre of the whole system of mountains in European Turkey. From this nucleus an elevated chain, bearing the names of Scomius and Rhodope anciently, passes south-eastward, and sends off branches on both sides, one of which, Pangeus, advances southward to the Ægean Sea, nearly opposite to the Isle of Thasus, and shuts in Greece on the east. From the same central nucleus another great chain passes south and south-eastward, under the ancient names of Scardus, Pindus, Cithæron, and Parnes, and terminates at Cape Colonna, the southmost point of Attica. This chain, which includes the celebrated mountains of Parnassus and Helicon, divides the northern continent of Greece into two parts of nearly equal breadth, and gives birth to all the most considerable rivers, which flow off on its opposite sides, but in no instance cross it. On the east side, besides many small lateral ridges, it sends off two principal branches, which enclose Thessaly on the north and south; these are the Cambunian Mountains, which, connecting the central ridge of Pindus with the lofty group of Olympus, separate Macedonia from Thessaly; and Mount Œta, which, running eastward to the Maliac Gulf, forms, at its termination, the famed pass of Thermopylæ. Mount Othrys, a little farther north, may be considered as a subordinate chain to Œta. Mount Olympus is separated only by a narrow ravine from Ossa and Pelion, which enclose Thessaly on the east. On the western side of the central chain, the whole country to the Ionian Sea, northward of the Gulf of Arta, is covered by a series of ridges, not running off laterally, but disposed in lines nearly parallel to the central chain, and separated by deep valleys. One of these ridges, nearest the coast, and terminating in a promontory, in latitude 40. 30., was known anciently by the name of Acroceraunus; another farther north, and more inland, was Mount Tomarus. A long and narrow ridge occupies the Island of Eubœa, and is evidently continued in the outermost chain of islands included under the name of the Cyclades. Another chain of these islands may be considered as a prolongation of the great central ridge from the promontory of Sunium or Colonna.

The mountains in the Morea or Peloponnesus, which are as numerous as in the north of Greece, present rather a singular configuration. A long ridge, bent into a circular form, encloses the central plateau or basin of Arcadia; and five spurs, or subordinate ridges, run off from the different sides of this circular chain to the five prominent points of the peninsula.

---

[1] Throughout this article we use the ancient or the modern names, according as either happen to be better known than the other. general, the ancient divisions of the country, being more minute and more accurately defined than the modern, serve better for e purposes of description. The greater number of modern travellers have felt it necessary to adopt this practice.

[2] In the maps of Barbie du Bocage, Laconia is considerably larger, and Attica and Achaia considerably smaller, than here stated. ut we have followed D'Anville, as his maps are pronounced, by a very competent judge (Sir William Gell), to be much more accu- te than any others since constructed.

Elevation of mountains.

The elevation of some of the Grecian mountains has been estimated, but not accurately measured. Mount Orbelus, the northern boundary of the country, has its summit covered with snow all the year,[1] and must therefore exceed 8000 feet in height; but none of the other mountains seems to reach the circle of perpetual congelation. The elevation of the great central chain of Pindus is loosely estimated by Dr Holland at 7000 feet.[2] That of Olympus, one of the loftiest summits in Greece, was computed by the ancient philosopher Xenagoras to be ten stadia and a plethrum, an elevation not materially different from that of 1017 toises, or 6500 feet, assigned to it by Bernoulli. The famed Parnassus seems to be considered by Dr Clarke and Dr Holland as rising above most of the other Grecian mountains; but as its summit is destitute of snow during a part of the year, its height cannot exceed 9500 feet, and is probably much less. This mountain is still called Parnassu by the peasants residing on it, but in the low country of Livadia it bears the name of Lakura.[3] The celebrated Athos, which is now the seat of twenty-two monasteries, rises to the height of 713 toises, or 4350 feet. (Walpole, p. 204.) Several of the Albanian mountains are estimated by Dr Holland to be from 3000 to 4000 feet high. The mean height of the mountains of the Morea is estimated at 1200 feet; on the west side they attain a height of from 3000 to 4500 feet; Mount Cyllene rises to the height of 4500 feet, and Mount Oleno to 6000; Mount Taygetus, in its range from Cape Matapan to Arcadia, varies from 3000 to 7200 feet. The plain of Tripolizza, in Arcadia, is about 2000 feet above the sea, and the insulated rock of the Acro-Corinthus about 1900. (Boblaye, *Annales des Sciences Naturelles*, Feb. 1831.)

Geology.

A great part of the surface of Greece is occupied by a formation of compact limestone, of a whitish or bluish grey colour, approaching at times to the nature of chalk. It forms in some places long sharp continuous ridges, in others round or craggy summits, and it presents strata highly inclined. It contains a few organic remains, with many flint nodules, and some beds of gypsum on the western side; and occasionally masses or beds of a calcareous conglomerate. The Acropolis of Athens consists of the last-mentioned rock. The compact limestone, which forms the entire mass of Parnassus and Helicon, rests on mica slate near Athens. The hills of Attica consist generally of primitive limestone; and the same species of rock, with clay slate, serpentine, sienite, porphyry, abound in Negropont, the central parts of Pindus, Olympus, and Athos, and all round the Gulf of Salonica. Farther north, in Mounts Scomius and Rhodope, granite and gneiss are found. In general, primitive rocks are most abundant on the east side of Greece, and the secondary on the west. Tertiary deposits are found in Elis, Laconia, and Argolis; and trachytes and other igneous rocks exist in Ægina, Milo, Santorin, and on the continent at Methana in Argolis. M. Boblaye states that four, and in some cases five, successive terraces of shingle are seen at many parts on the shores of the Morea, each of which had once formed the sea beach, indicating that the land had been elevated by a corresponding number of sudden movements upwards. (Boblaye, *Annales des Sciences Naturelles*, Feb. 1831; Holland's *Travels*, p. 89, 319, &c.) It is to the peculiar constitution of the great limestone formation that Greece owes those physical features which so remarkably distinguish the country; the numerous caverns, fountains, subterraneous river courses, hot springs, and gaseous exhalations, which gave birth to so many of the popular superstitions of the ancients.

Rivers.

The rivers of Greece, flowing within a narrow territory, are much inferior in size even to the larger branches of the Danube. They may be fitly compared with those of Great Britain for the length of their courses and the quantity of water they convey. The classical rivers, however, which are chiefly in the south, are generally mere brooks, such as would find a place only in a county map. The largest rivers in Greece are the Axius, now the Vardar, in Macedonia; the Drinius, now the Drino, in North Albania; the Peneus, now the Salympria, in Thessaly; the Achelous, now the Aspropotamo, in Ætolia; the Alpheus, now the Roufia, and Eurotas, now Vasilipotamo, in the Morea. These and some others have permanent streams; but the greater number are mere mountain torrents, short, but rapid in their courses, and dry in summer.

General aspect.

The general aspect of Greece is characterized by a very singular distribution of its mountains. These are usually neither placed in parallel chains nor in massive groups, but are so disposed as to enclose extensive tracts of land, which assume the appearance of large basins or circular hollows. The bottom of these basins consists of an alluvial plain of the richest soil, and level as the ocean, through which sometimes rise steep insulated rocks, like the summits of vast natural columns. Nature had thus marked out the country into a number of distinct districts, admirably calculated to become the seats of small communities. The plain, with its rich alluvial soil, furnished subsistence for a dense population; the insulated rock became the Acropolis or citadel of the chief town, a place of refuge in war; and the surrounding mountains were barriers against invasion. In proportion as access from without was difficult, internal communication was rapid and easy. A crowded population, dispersed over the sides and the area of this natural amphitheatre, lived as it were in the continual presence of one another. Their country, a word of undefined import in large empires, conveyed to them as distinct an idea as that of their own homes. Its whole landscape, with its trophies, temples, monuments, and fields of renown, were constantly under their eyes. Their patriotism, concentrated within this narrow sphere,—attached to visible objects by early and habitual associations,—kept alive by frequent struggles with neighbouring communities, for independence or glory, and still more by the proud sense of individual importance, inspired by their republican institutions,—was not, as in larger empires, a vague and languid feeling, but an ardent and steady passion, of which nothing in the modern world can give us an adequate idea. The same circumstances had an influence on their political condition. Conquest, which forces nations of different habits, characters, and languages, into combination, is the great parent of slavery. In such heterogeneous masses union becomes impossible. The despot, glittering in barbaric pomp, and surrounded by foreign guards, appears in his subject provinces like a being of another order, not to collect the sentiments or redress the wrongs of the people, but to silence all complaints, and enforce obedience to his own lordly will. Though hated by all his subjects, he can still employ the wealth and the physical force of one nation to trample on the rights of another, and is thus able to hold the whole in slavery. But the small Greek communities, protected by the barriers of their gulfs and mountains, escaped this evil destiny. The people, united by identity of manners and language, by common interests and continual communication, could combine with the utmost facility to resist the first encroachments of their rulers. They were able to apply freely the lights of reason to all their common concerns, to model their government according to their circumstances and their views of common interest, and to make the end for which it existed the measure of the powers bestowed upon it. The forms of government they adopted, though not contrived by absolute wisdom, were probably in principle better adapted to their situation than any other that could have been suggested. And never did the powers of the human mind display themselves with such energy and grandeur under any other system in the history of the human race.

Of the plains we have mentioned, some terminate in the ocean, and seem to owe their existence to the retiring of the waters. Such are those of Macedonia, Athens, Argos, Laconia, Messenia, and Ambracia. Others are completely surrounded by a rampart of mountains or high grounds, except at a single point where the waters have found or forced a passage. Of this description are the three remarkable valleys of Thessaly, Bœotia, and Arcadia. Each of these forcibly suggests the idea of a vast inland lake, where the waters, accumulating for a long period, had at length burst through the barrier that confined them, and left the bottom dry. There is also an analogy between these valleys and some of the inland seas of Greece, such as the Gulfs of Corinth, Arta, Volo, and the channel of Negropont, which are marine lakes completely land-locked, and communicating with the Mediterranean by a single passage, which may at one period have been closed. It may even be conceived that the Archipelago itself, at one period, was completely shut in by a barrier of high lands, of which Cerigo, Creto, Scarpanto, and Rhodes, are portions or fragments; and that its numerous isles are either the summits of mountains which then diversified its surface, or of detached rocks like those of Meteora in Thessaly, which have resisted the incessant action of the waters.

The valley of Macedonia, which extends in a semicircle round the head of the Gulf of Salonica, is the largest and most fertile district in Greece. Its produce has been supposed to be nearly equal to that of all the rest of the country. The rivers in the lower parts, which overflow annually, render the country marshy, and subject to the malaria. It contains a considerable number of ancient remains, but they have only been partially examined. A large tumulus still marks the site of the battle of Pydna, which reduced Macedonia to a Roman province. Thessaly, separated from Macedonia by Olympus and the Cambunian Mountains, is a vast circular basin, of fifty or sixty miles diameter, enclosed on all sides by mountains, and next in fertility to Macedonia. The whole of its waters flow off by the river Peneus. The celebrated Vale of Tempe, a deep ravine, formed by precipitous cliffs six or eight hundred feet high, and separating Mount Olympus from Ossa, affords a passage for this river to the sea on the east. The vale is about five miles long, and so narrow, that the river in some parts occupies the whole breadth of its bottom; the scenery is more striking by its grandeur than its beauty. The rocks, which are of bluish-grey marble, have a shattered appearance, and, wherever the surface admits of it, are covered with trees and shrubs. Some of the ancients believed that this defile was formed by an earthquake. Were any natural convulsion to close it up, Thessaly would again be converted into a lake; and Xerxes, when he invaded Greece, threatened the Thessalians with this catastrophe if they opposed him. The rocks of Meteora, at the upper side of the Thessalian plain, are objects of a very remarkable kind. They rise from the level surface of the country near the Peneus, and cover a triangular space of two miles each way. They consist of a great collection of lofty rocks, in the various shapes of cones, pillars, rhomboids, and irregular masses, all standing detached from one another, with faces generally as perpendicular as a wall. Their height varies from one to three or four hundred feet, and the deep winding intervals between them are filled with trees and brushwood. On the summits of some of these rocks monasteries are suspended in mid air, as it were on the tops of very tall pillars. Some of the monasteries occupy the whole surface of the rock they rest on, and persons ascending to them are swung in a basket or net, and dragged up by a rope passing over a pulley. The rocks are composed of a conglomerate, consisting of fragments of granite, gneiss, and other primitive substances, disposed in horizontal strata. The narrow district on the eastern side of Mounts Ossa and Pelion is the ancient Magnesia, and is now called Zagora. At the south extremity of Thessaly lies the famed Pass of Thermopylæ, which is merely the narrow space between the flank of Mount Œta and the sea. The part of this space nearest the sea is occupied by a marsh, between which and the cliffs the breadth of firm land is still about sixty paces, as stated by Livy. The hot springs mentioned by Herodotus, the remains of the wall built by the Phoceans, and a tumulus, believed with good reason to be that of the Spartans, are all yet to be seen. The length of the pass is about five miles. The country of Phocis, which lies immediately south of the pass, is one of the most rugged in Greece, being occupied almost entirely by the branches and declivities of Mounts Œta, Parnassus, and Helicon. Bœotia is a large circular valley, enclosed by Parnassus on the west, Helicon on the south, Cithæron on the east, and a range of high lands on the north. A low ridge running north and south divides it in two. The lake Copais, which occupies the bottom of the western and larger division, and receives all its rivers, sends off its waters by subterraneous passages to the sea on the north-east. In summer this lake has the appearance of a green meadow covered with reeds. Bœotia has more than once been inundated by obstructions in these subterraneous channels. The country is very fertile, but is higher and colder than Attica. It is often covered with thick fogs, as described by the ancients; and, from the abundance of its marshes, is very subject to malaria. Attica, which adjoins to Bœotia on the east, is comparatively arid and barren, hilly rather than mountainous, but distinguished peculiarly by the dryness and elasticity of its atmosphere, and the beauty and serenity of its climate. The isthmus of Corinth, which connects Attica with the Morea, is occupied towards the north by high rocky hills, which render it strong as a military post; but in the south, where its breadth is about four miles, the surface is low, seldom exceeding a hundred and fifty feet. The remains of the ancient wall, and of the canal begun by Nero, are yet visible. The Morea consists of an elevated central plateau or valley, namely, Arcadia, and of five separate districts, formed by the exterior declivities of the mountains which surround the central plateau, and by spurs or branches which run off from these mountains. The central valley of Arcadia, so famed for its pastoral character by the ancients, is, like the inland districts of Thessaly and Bœotia, high and cold, often covered with fogs, arising from the moisture of its soil, and hence also subject to malaria. All its running waters escape by the single channel of the Alpheus; and it has sometimes suffered from partial inundations. Its scenery, in the opinion of Lord Byron, is by no means deserving of its ancient celebrity. Argolis, lying in a semicircle round the Gulf of Nauplia, embraces but a small portion of level country, which, however, is remarkably rich, but very unhealthy. The city of Argos still exists in its ancient plain, and, till ruined by the revolution, was one of the best built towns in the Morea. The ancient

Laconia, consisting of the long open valley of the Eurotas, is very thinly peopled. The ruins of Sparta, four miles south-west from the village of Mistra, are extensive, but afford no fine specimens of architecture; the spot is entirely deserted. Messenia, which lies round the head of a gulf, has a pretty large plain, of a very rich soil. Elis, on the west, and Achaia, on the north of the Morea, are in general hilly, and rather dry. In general, the west of Greece has a different physical character from the east. Ætolia, Acarnania, and Epirus (the modern Albania), present none of those circular basins so characteristic of the east and south sides of the country, except the valley surrounding the Gulf of Arta. Ætolia and Acarnania consist of long valleys open to the south, and rising into mountains in the north. Albania has the same features on a larger scale. Its mountains, which are more numerous than those of any other district of Greece, cover the country in long parallel ridges, and are separated by deep valleys, some of which open to the south, and others to the west, but none to the north. The Cyclades, and other islands in the Ægean Sea, are almost all steep and rocky.[1]

Scenery.

The mountains of Greece, which cover so large a proportion of its area, are partly wooded and partly naked, and the woods abound more on the west side than the east. The low country susceptible of tillage probably does not amount to more than two fifths of the whole surface, and of these two fifths, judging from the corn, olives, cotton, tobacco, &c. required for the population, one twelfth or fifteenth part may be actually in cultivation. It is generally bare of wood, and, from the want of enclosures, the profusion of weeds and brushwood, the thinness of the population, and the ruinous condition of the few cottages, combined with the crumbling remains of the noble structures of the ancients, has a desolate, melancholy, and deserted aspect, which harmonizes well with the fallen fortunes of the country. In the end of summer, from the excessive heat which dries up the streams, the hills and fields appear parched. In many quarters of the country, however, there are copious perennial springs, which gush out suddenly from the limestone rock. Greece combines in the highest degree every feature essential to the finest beauties of landscape, except large rivers, which are perhaps incompatible with the general character of its scenery. Travellers of taste have wanted words to describe the magnificence of the views it affords. Its mountains encircled with zones of wood, and capped with snow, though much below the Alps in absolute height, perhaps are as imposing from the suddenness of their elevation. Rich sheltered plains lie at their feet, which want nothing but an industrious population to fill the mind with images of prosperity, tranquillity, and happiness. But it is in the combination of these more common features, with so many spacious and beautiful inland bays and seas, broken by headlands, enclosed by mountains, and specked and studded with islands, in every variety of magnitude, form, and distance, that Greece surpasses every other country in Europe, and perhaps in the world. The effect of such scenery, aided by a serene sky and delicious climate, on the character of the Greeks, cannot be doubted. "Under the influence of so many sublime objects, the human mind becomes gifted as by inspiration, and is by nature filled with poetical ideas." Greece became the birth-place of taste, science, and eloquence, the chosen sanctuary of the muses, the prototype of all that is graceful, dignified, and grand, in sentiment or action. The poetry of the north, nursed amidst bleak mountains, amidst oceans covered with fogs and agitated by storms, is austere and gloomy; but the muses of Greece, awakened into life in a rich and beautiful land, amidst bright and tranquil seas, are gay, joyous, and luxuriant. You almost conceive (says Chateaubriand), as it were by intuition, why the architecture of the Parthenon has such fine proportions, why ancient sculpture is so unaffected, so simple, so tranquil, when you behold the pure sky and delicious scenery of Athens, of Corinth, and of Ionia. In this native land of the muses, nature suggests no wild deviations: she tends, on the contrary, to dispose the mind to the love of the uniform and the harmonious.[2]

Climate.

The climate of Greece seems to be distinguished from that of Spain and Italy in the corresponding latitudes, chiefly by having the characteristics of an inland region in a higher degree; that is, the extremes of summer and winter are more severe. In Attica, which has a drier atmosphere and more uniform temperature than the rest of the country, the average rain is about twenty-one or twenty-two inches, and the greatest heat, in each of the four years ending with 1807, was 104, 99, 93, 94. The greatest cold was from 28 to 32 of Fahrenheit. The mean deduced from all these extremes is 63·5. This agrees very nearly with the temperature of a spring in the isthmus of Corinth, observed by Dr Clarke to be 64, and with the temperature given in Professor Leslie's table, which is 64·4. At the southern extremity the annual temperature, according to the same authority, is 65·3, and at the northern extremity about 60. But local diversities have a greater effect than mere difference of latitude, on the distribution of the seasons. In Attica, which, being freely exposed to the sea, has in some measure an insular climate, the winter sets in about the beginning of January. About the middle of that month snow falls, but is seldom seen for more than a few days, though it lies for a month on the summits of the mountains. Gentle rains fall about the middle of February, after which spring commences; and the corn, which is a considerable height in March, is cut in May. In the beginning of March, the vines and olives bud, and the almonds are in blossom. In the great interior plains and valleys, which are girt with mountains, and cut off from the direct influence of the sea, the winters are much colder, and the summers, making allowance for the difference of height, are warmer. At Tripolizza, in Arcadia, the snow has been found eighteen inches thick in January, with the thermometer at sixteen degrees Fahrenheit; and it sometimes lies on the ground six weeks. Dr Clarke was informed, that in the winter preceding his visit, the peasants at the foot of Mount Cithæron in Bœotia were confined to their houses for several weeks by the snow. At Yanina, situated in an inland plain, 1000 or 1200 feet above the sea, the snow lies to a considerable depth in the winter, and sometimes falls as late as April. The neighbouring lake was so firmly frozen over in 1813, that it was everywhere crossed on the ice. The summits of the central chain of Pindus, and most of the Albanian mountains, are covered with snow from the beginning of November to the end of March. These various facts show that the winter in Albania, though shorter than in England, is as severe; but that the summer is a vast deal hotter, the extreme summer temperature being fifteen or eighteen degrees higher at Athens than London; while Bœotia and Thessaly are probably still hotter than Attica. Though we have no accurate data to establish a comparison between the climate of Greece and those of Spain and Italy, yet the fact of cotton being successfully cultivated, on a large scale, in Macedonia, as far north as the latitude of Rome and Valadolid, where it does not succeed in the two last countries, is a proof that the summer temperature in Greece is higher than either in Spain or Italy. The coldest weather in all parts of Greece is accompanied with a north-east wind. The north and north-west winds are distinguished by their serenity and dryness. The zephyr or west wind is famed for its balmy softness; the south-east, south, and south-west winds are all humid, and the east wind still retains the character of a morning breeze, as described by Aristotle. The sirocco is felt in Greece. It blows from the south-east, and produces its usual effects on the human constitution; a sense of oppression, a dull headach, with lassitude and uneasiness in the limbs. Earthquakes are very frequent in Greece, but they are seldom very destructive.[1]

Modern travellers afford us but scanty information respecting the mines of Greece; but, from its geological structure, we may conclude that it is, like Italy, rather poor in metals. The working of the veins which do exist is neglected by the Turks, from want of skill, or abandoned in consequence of the oppressive exactions of the government. It is chiefly on the east side of Greece, where the older rocks protrude through the superincumbent limestone, that metalliferous veins have been found. The silver mines of Laurium, in Attica, which were extensive enough to employ 10,000 slaves, and supported the Athenian navy at one period, are now entirely abandoned. Copper also was anciently found in Attica. Ores of iron, gold, silver, lead, or alum, were wrought in Eubœa and Melos, Naxos, Siphnos, and others of the Cyclades. The gold and silver mines of Macedonia yielded Philip 1000 talents a year. At Nisoro, in this country, there is still worked a silver mine, which affords a scanty produce of from fifty to 400 okes[2] of silver, and 4000 or 5000 okes of lead annually. Marbles of many varieties are abundant in Greece. Those of Paros and Mount Pentelicus, which are both highly crystalline, were employed in the finest works of sculpture and architecture. At Selinizza, in North Albania, there is a very extensive mine of asphaltum, or compact mineral pitch. The bed, seventy or eighty feet thick, and near the surface, is supposed to extend over a span of four miles in circumference. Carburetted hydrogen gas issues from several crevices of the ground near it, and inflames spontaneously; a phenomenon distinctly alluded to by ancient authors, and connected in this and other instances with the superstitions of the Greek mythology.[3]

There are few or no diseases peculiar to Greece. Like all the countries on the shores of the Mediterranean, it suffers greatly from malaria. This prevails chiefly in the months of August and September, and produces remittent or intermittent fevers, which attack those who reside in low situations, near the mouths of rivers, or in the neighbourhood of lakes, marshes, or rice grounds. The ancients were aware that fevers of this description affected certain districts; but, undoubtedly, the sphere of their influence has been vastly extended by the neglected state of the country. Attica, though one of the driest districts of Greece, is not entirely exempted from them. These fevers, recurring frequently, vitiate the system, and produce goitres and scrofulous complaints. Coughs, catarrhs, and apoplexies, are prevalent in some districts; and elephantiasis, and leprous affections, arising probably from deficient and unwholesome nourishment, are more common than in other countries. The plague occurs at irregular periods, and makes great ravages, but is generally believed to be imported from Constantinople, Smyrna, or Egypt. The first appearance of this dreadful scourge spreads alarm and terror through the whole community. The affrighted imaginations of the people represent to them nocturnal concerts of music, voices murmuring amidst the silence of night, spectres wandering about on the roofs of houses, covered with funereal rags, and calling out the names of those who are to be cut off from the number of the living.[4]

Greece.

Agriculture.

A rapacious and tyrannical government, like the Turkish, depresses every species of industry, but is particularly fatal to agriculture, which requires the investment of large capitals, with the prospect of only distant returns, and which yields products that cannot be concealed. The Turkish landlords and farmers are too sluggish and ignorant to attempt the smallest improvement; the other classes are too much exposed to pillage; and all must be affected by the insecure tenure of their lands. In Greece, as in other parts of Turkey, all lands hold immediately of the sultan, and on the demise of the incumbent, vest anew in him. When the Turks conquered the territories they now occupy, the lands were taken from the native proprietors, and a part of them distributed among Turkish colonists in *zaims* and *timars*[5] (the one exceeding 500 acres in extent, the other from 300 to 500), on condition that the possessors, with a stipulated number of followers, should serve in the armies during war. Any of these properties which fell vacant during active service were bestowed upon the volunteers who had signalized their valour in the hope of obtaining such rewards; and there are instances of the same lordship having been eight times disposed of in the course of one campaign. Another part of the land was appropriated for the support of mosques, or as appanages to the great officers of state, the mother and mistresses of the sultan, and the children of the imperial family. The residue, burdened with a territorial impost or land-tax, was left, by an undefined tenure, to the ancient inhabitants. (Thornton, 164.) In general, both Greeks and Turks pay a quit rent to the aga or local governor, besides the land-tax of one tenth to the sultan. We do not find it anywhere stated what proportions these different species of property bear to one another; but it is obvious that a great part of the land is held by persons who have but a liferent interest in it; and though custom may temper a rule so pernicious, and the right of resumption may not be rigorously exercised at the demise of each incumbent, it will still be made a ground for vexatious demands, and render the transmission of property dependent on the caprices of provincial governors. To this must be added the farther insecurity arising from bad laws badly administered; from the extortions practised by every class of public functionaries, civil and religious; and, last of all, from the depredations of bands of robbers, who descend from the mountains, sometimes in parties of five or six hundred, to dispute with the local rulers the right of plundering the unhappy husbandman. Ali, the late pasha of Albania, permitted no sale or transfer of lands within his dominions without his special consent. He held great quantities of land himself; and, not content with buying it from those who were disposed to sell, he compelled others, by quartering soldiers on them, and harassing them by vexatious demands, to part with their lands for an inadequate price. He was believed to be the proprietor of one third of the whole cultivated country under his government. In such circumstances, it need not surprise us that cultivation is badly conducted, the peasants poor and wretched, and the country a wide waste, affording a miserable subsistence to two millions and a half of inhabitants, where three or four times as many lived in comfort and prosperity in the days of Xenophon.[1]

[1] Holland, 47, 137, 411, 426; Hobhouse, let. 24.; Pouqueville, p. 29, chap. xv.; Clarke, vi. 585, vii. 102; Arist. *Meteor.* l. 2, c. 2.

[2] The *oke* is equal to 2¾ pounds avoirdupois; Dr Holland says 2½; but Beaujour, the best authority on this subject, makes the oke equal to 40 Paris ounces, which are equal to 43·3 English ounces. The cantaar or quintal is generally 44 okes = 121 pounds. The kilo or quilot of corn is 22 okes, or 60 pounds. (Beaujour, let. 24.)

[4] Pouqueville, chap. xvi.; Clarke. vii. 470; Walpole, p. 13.

[5] The number of these feudal lordships is variously stated. Olivier says there are 914 *zaims*, and 8356 *timars*, in European Turkey. If these are estimated at 500 acres each, they will not amount to more than 1-20th or 1-25th of the whole lands, including mountains.

Corn.

The most considerable proprietors, both Turks and Greeks, live generally in towns, and the land is let to the peasants on a system resembling that of the metayers in France. The farms are let from year to year; the landlord furnishes cottages, cattle, and seed; the tenant labours the ground; and after a tenth of the produce is set aside for the public tax, the remainder is divided into three parts, of which the tenant gets one and the proprietor two. When the tenant has cattle and a house of his own, he gets one half. In the chiflicks or farms belonging to Ali, who was a rigorous landlord, two thirds were taken when the peasant found stock and seed, and five sixths, it is said, when he furnished nothing but labour. Enclosures are extremely uncommon, and scattered hamlets or cottages are scarcely anywhere seen, the peasants living in villages for the sake of security. Both the husbandman and shepherd, when employed in the fields, has always a musket slung over his back, besides a pistol and sword at his side. Their cottages are hovels built of mud, straw, and boards, generally without an opening to let the smoke escape. Sometimes they are without walls, and consist merely of wooden poles laid together in the form of a tent, and covered with turf, like the huts of savages. Women are employed in the labours of the field in Albania and Maina, but rarely in other parts. The cultivation of corn land is generally rude and slovenly; but in some districts, where, from local circumstances, the people are well protected, it is neat and clean, though not skilful. Cotton and olive grounds and vineyards, which are laboured chiefly with the hands, are managed with more care; and, in general, that part of the cultivation which depends on manual labour, and requires neither capital nor good implements, is best executed. The management of sheep and goats is also better conducted than that of arable land, doubtless because store farms are generally in situations more capable of defence, and their stock is easily removed. In gardening, the Greeks turn up the soil with a mattock, being unacquainted with so common an instrument as a spade. The implements of agriculture are few and simple. In light lands like those of Messenia, the plough consists merely of a share pointed with iron, without any other parts attached to it. It is dragged by one horse or two asses. In stronger soils the share is fixed into a plough with one handle and two mould boards, and in some cases with block wheels. In Albania the plough consists of a pole, a share, and one handle, all of wood except the share, which is pointed with iron. In Bœotia, Thessaly, and Albania, and in Greece generally, the plough is drawn by two oxen, sometimes by asses or buffaloes, very seldom by horses. A hundred stremata of land require four oxen if the soil is light, or eight oxen if heavy. The strema is stated to be forty square paces; if yards are meant, it will be very nearly one third of an acre. The corn, cut with a sickle, is separated from the straw in the ancient mode, by treading it under the feet of oxen or horses. Fallowing is practised, and manures are used, though the small quantity of ground in tillage will, of course, render it unnecessary to cultivate poor soils, which require much artificial nourishment. In some few parts of Macedonia and Thessaly a sort of clumsy car with solid wooden wheels is used, but everywhere else wheel-carriages seem to be unknown, produce and goods of all kinds being carried on the backs of horses, mules, or camels.

The most common crops are wheat, barley, maize, and rye; besides these, oats in very small quantity; rice in marshy spots, millet, peas, beans, tares, sesamum, and anise, with cotton and tobacco. Turnips, if raised at all, are confined to gardens, and potatoes seem to be entirely unknown. The corn, sown in November or February, is high in the beginning of March, and is cut in May. It is sometimes sown as late as April, and reaped in two months. After a crop of barley, cotton is sometimes sown and reaped the same season. The soil of Attica is too light for wheat; and hence barley, as in ancient times, is still the prevailing crop. In the Ionian Isles, and probably in the moister parts of Greece, wheat is protected from the effects of heavy dews by two persons dragging a long rope over the field, so as to shake the husks. In the rich soils of Macedon, to save the wheat from being injured by superabundant nourishment, it is usual to let it be eaten by sheep early in the season, a practice familiar to the ancient Greeks. Notwithstanding the wretched system of culture, the produce is large. The most fertile parts are the plains of Thessaly, Bœotia, Sicyon, Argos, Messenia, Arcadia, and Macedonia. The soil of the latter, in the opinion of Beaujour, is superior even to that of Sicily. An arpent[2] of this soil usually produces from twenty-five to thirty quintals (hundredweights) of wheat. In the Arcadian plains wheat of several kinds yields twelve for one; in those of Argos ten for one; in Eleusis, the primitive seat of agriculture, and in Thessaly, twelve for one. The produce of good soils, generally in favourable seasons, is estimated by Mr Hawkins at ten or twelve for one; and of the best soils, in very favourable seasons, at from fifteen to eighteen for one. If these estimates are well founded, considering the rude system of cultivation, they are proofs of a very great degree of fertility. In England, the average return from the seed, notwithstanding its highly improved agriculture, is believed not to exceed nine for one. The very best soils yield from six to seven quarters of wheat per acre, weighing from twenty-four to twenty-eight hundredweight; but from ordinary soils, the average produce per acre is only about twenty or twenty-one bushels, weighing from ten to eleven hundredweight. Greece exports corn to a considerable extent.[3]

Pasture.

Greece, abounding in mountains covered with herbage, is eminently a pastoral country; and the management of sheep is better understood than the other branches of rural economy. The modern breeds, however, have declined much from the ancient in beauty and value. The flesh is but indifferent, the wool of inferior quality, and the weight of the sheep is only from thirty to fifty pounds. The flocks of Arcadia and Livadia, especially those which feed upon Parnassus, are considered superior to the others. A black-woolled breed is very common. In Greece, as in Spain, the flocks migrate from the inland mountains to the low valleys near the sea at the approach of winter. Attended by the owners, with their servants, they come down in October in

Greece.

ast numbers to the low country, where they enjoy the ght of pasture under the laws or customs of the empire, d they return to the hills in April. The goats, which e also numerous, are shorn along with the sheep, and eir hair is made into sacks, bags, and carpets. The flocks e guarded from the wolves by very large and strong dogs, pposed to be descended from the ancient Molossian breed. ttica, which forms only the fiftieth part of Greece, was ated before the revolution to possess 100,000 goats and ,000 sheep, about one tenth part of which are killed yearl. And yet it is not so much a pastoral country as Albaa, Phocis, or Arcadia. The oxen, which are chiefly used r labouring, amounted to about 3000 in Attica: the cows, incipally kept for breeding, were rather less numerous. he oxen of the Morea are low in stature, have long white ir, and weigh from three to four hundred pounds. The ws there give little milk, and are exposed to jackals, hich tear away the teats, and to serpents, which are said suck the milk. About 6000 head of cattle were consumd annually in the Morea; but as both Turks and Greeks efer mutton, the number of sheep killed was incomrably greater. A very fine breed of oxen is found in at district of Albania which corresponds to the ancient haonia, and which has probably derived its beauty from e ancient breed of the country, celebrated by Aristotle, lian, and others. In all parts of the Morea, buffaloes, hich are handsome animals, with fine skins, are used in sbandry, and when unfit for labour are killed and eaten. he horses of the Morea are little to be admired for their auty, but are active, vigorous, and sure footed. The ses, which are numerous, but small and mean, are used beasts of burden; mules and camels are employed in the me capacity, but the latter are brought from Asia, and e not numerous. The annual produce of Macedonia, in ool, is estimated by Beaujour at 700,000 okes (2,000,000 unds); of the Morea, by Pouqueville, at 12,800 quintals ,500,000 pounds): and it sells at about fifteen piastres[1] 8s. 9d.) the quintal. The Morea produces annually about ,500 quintals of cheese (chiefly from the milk of sheep d goats), which sells at seven piastres the quintal, or about e penny per pound.

Cotton is cultivated from one extremity of Greece to the her, but on the greatest scale in the district of Seres in acedonia, a rich and populous plain watered by the anent Strymon, and containing three hundred villages, so ar one another as to present the appearance of one large raggling town. Cotton is a more profitable, but more ecarious crop than corn; requiring clear sunshine, coous dews, and light rains, to make it succeed. An arnt of good soil produces from two hundred to three huned okes (550 to 825 lbs.) of cotton. The plain of Seres one produced 70,000 bales, or seven millions of okes, of tton, of which 50,000 bales were exported. Considerle quantities are also raised in the ancient Chalcidice nother district of Macedonia), in Thessaly, Bœotia, and e Morea. The annual produce of the last, according Pouqueville, was only 59,000 okes, exclusive of two rgoes exported.[2]

Tobacco.

Tobacco, though introduced into Turkey only about the middle of the seventeenth century, is now a luxury in universal use. It is cultivated on a very narrow scale in the south of Greece, but to a considerable extent in Albania and Macedonia, and of a quality much esteemed. The Turkish plant is not however so pungent as that of America, and latterly the produce seems to be diminishing. The quantity annually raised in Macedonia was estimated by Beaujour (between 1787 and 1797) at 100,000 bales, or 10,000,000 okes, valued at 4,000,000 piastres. It occupied about one eighth of the cultivated soil, and afforded support to 20,000 Turkish families. One half of the quantity raised was exported to Egypt, Barbary, and Italy. In 1812, the annual produce, as stated to Dr Holland, was only from 35,000 to 40,000 bales. (Beaujour, let. 3; Holland, 329; Hobhouse, 15.)

Olives.

The olive is cultivated throughout Greece generally, but that of Attica is still distinguished, as in ancient times, by its superior excellence. It requires a dry soil, a sheltered situation, and a warm exposure; and is therefore not adapted to the rich, moist plains of Bœotia and Thessaly. The tree gives fruit the twelfth year, arrives at full vigour about the twentieth, and, when not exposed to frost, is so durable, that the present olives of Palestine are believed to date from the Crusades. An arpent of ordinary olive ground will nourish a hundred and twenty trees, each of which yields in good years twenty, but in average years ten, French pounds[3] of oil, and as this sells at six or eight paras the pound, the whole value of the produce is about L.12 sterling. Before the revolution, Attica yielded annually of this oil 2,400,000 pounds, of which three fourths were exported. It is at present, as it was in ancient times, the staple produce of the country; the tree was indeed considered as a special gift from the gods; and its cultivation was favoured by peculiar protection and encouragement, as far back as the reign of Cecrops. The Morea, according to Pouqueville, yielded 5,570,000 pounds of oil. The amount of the produce of Albania and other districts is not known. If the opinion of the ancients is well founded, that the olive does not thrive at a great distance from the sea, it may be presumed that the plantations in the interior of the country are less numerous than on the coast.[4]

Vines.

Vines are cultivated on a small scale in Attica, Albania, Thessaly, and in most of the districts of Greece, but without the skill and refinement which the ancients had introduced into this branch of rural economy. Dr Clarke, however, observed some vineyards on Parnassus, which were managed with much care and neatness, and afforded excellent wines. In general, the Greek wine, owing to the resin and lime mixed with it, has an unpalatable harshness. Pouqueville estimated the produce of the Morea, in wine and brandy, at 32,300 barrels, of fifty okes each, or about 550,000 gallons. If the vineyards are not more extensive in other quarters, the whole produce of the country must be inconsiderable.[5]

Currants.

The species of grape called the Corinthian grape, or the currants of commerce, is almost peculiar to the Morea and the Ionian Isles, though believed not to be indigenous in these countries. It is found in the greatest perfection along the southern shores of the Corinthian Gulf, on some points of the opposite coast, and in Cephalonia, Ithaca, and Zante. Beaujour thinks it was brought from Naxos about 1580; and it must therefore have been unknown to the ancients on the continent. It succeeds best in plains near the sea, with a western exposure, and prefers a dry, light soil. The mean annual produce of the Morea before the revolution was estimated at 10,000,000 pounds, of which 8,000,000 were exported to the western parts of Europe, chiefly to Britain. They were sold at eighty piastres the thousand pounds, including duties and expenses, which add sixty or seventy per cent. to the first cost. Patras is the centre of this trade. (Beaujour, let. 8.)

---

[1] The piastre is equal to 40 paras, and the para is equal to 3 aspres. The value of the piastre, from the progressive debasement the Turkish coin, has been continually sinking; and it is besides liable to fluctuations from variations in the rate of exchange. Dr handler, in his time (1764), reckoned the piastre worth 2s. 6d. English. Beaujour says, that in his time (1787 to 1797), its intrinc value was 28 sous (1s. 2d.), but its value in exchange was, on an average, about 37 sous (1s. 6½d.). Dr Clarke (1800) represents it worth 1s. 4d. Mr Hobhouse (1809) says, that when the exchange is at par, 17½ piastres are equal to one pound, which gives 1s. d. for its value. Dr Holland (1812) generally reckons the piastre about 1s. 1d. Mr Williams (1817) makes it worth 8d. in exhange; and in 1832 Mr Urquhart estimates the piastre at the 75th part of a pound, or 3¼d. (*Turkey and its Resources*, 1833.) In e calculations in this article, the piastres are generally turned into English money, at the value assigned them by the author from hom the facts are taken.

[2] Beaujour, let. 2; Pouqueville, 462; Holland, 227, 248.

[3] The French pound is to the English pound avoirdupois as 100 to 92.

[4] Beaujour, let. 7; Pouqueville, 462; *Trav. of Anach.* chap. lix.; Theophr. *Hist. Plant.* vi.

[5] Clarke, vii. 254; Holland, 212; Hobhouse, 91; Pouqueville, 462; *Trav. of Anach.* chap. lix.

Madder.

Madder grows wild in abundance, but is an object of cultivation in the moist plains of Bœotia, where 1200 sacks (of 275 lbs. each) are raised, of which 700 are consumed in Greece in dyeing spun cotton, and the other 500 are exported. The produce of vermilion from the kermes insect is considerable. The canton of Livadia furnished 6000 okes, and the Morea 22,000 okes, valued at from six to eight piastres the oke. A part is exported.[1]

Silk.

The mulberry tree is becoming an object of increasing importance in Greece, and the produce of silk is considerable. The districts that take the lead in this branch of industry are Elis, Thessaly, and Magnesia, now Zagora. It is chiefly conducted by the women. The annual produce of the Morea in silk was about 79,000 okes, that of Zagora 25,000 okes; which sold at fifteen or eighteen piastres the oke. A part of the silk of Thessaly is sent across the mountains to Albania.[2]

Honey.

The management of bees is an object of considerable attention. This branch of industry is even so far favoured by the Turks, that hives, under a regulation of Soliman II. are not seizable in payment of taxes. Honey is abundant in every part of Greece and Albania, but that of Mount Hymettus still maintains its ancient pre-eminence. It is remarkably transparent, and, in the opinion of Beaujour, is superior to the best honey in France. There were about 3000 hives on this mountain, and 12,000 in the whole of Attica, which yielded 360,000 pounds of honey and 24,000 pounds of wax. About one tenth was consumed within the country, the rest was exported. The honey sold before the revolution at eight or ten paras the pound, the wax at a piastre. The produce of the Morea in honey, judging from Pouqueville's table, does not much exceed one half of that of Attica.[3]

Fruit trees.

The fruit trees which grow in the fields or gardens of Greece, besides the vine and the olive, are, the almond, pomegranate, orange, lemon, citron, banana, fig, with the peach, apricot, quince, plum, and others of a more common kind. The date grows, but does not bear fruit. The process of caprification, or exposing the fig to be punctured by insects, which is minutely described by Pliny, is still in use, and is thought to improve the fruit greatly. The gardening of the Greeks is badly conducted, and many of their fruits want the rich flavour which might be given them by the art of engrafting. Their melons, water melons, and gourds, are excellent, and form a considerable part of the subsistence of the inhabitants. Their culinary vegetables, of which they have no great variety, are spinage, artichokes, cabbages, cauliflowers, carrots, beans, lettuce, celery. The forests produce the oak, kermes-oak, cork-tree, pine, larch, ash, plane, aloe, wild olive, the sweet chestnut, whose fruit is the temporary food of the people in many parts, the *Fraxinus ornus*, or ash which yields manna, the turpentine pine, various trees and plants which yield dyes; and a vast variety of flowers and aromatics.[4]

Wild animals.

The wild animals of Greece are, the bear, wolf, lynx, wild cat, wild boar, stag, roebuck, wild goat, badger, marten, fox, hare, jackal, weasel, and hedgehog. The bears are rarely seen; but the wolves are numerous; and to guard the flocks and cattle from their ravages, great numbers of dogs, of a powerful and fierce breed, are kept all over the country. The peasant who kills a wolf is rewarded, not, as in the time of Solon, out of the public funds, but by a small voluntary contribution. Hares are very abundant, but they are not much hunted, except by the Greeks. The method of *calling* hares, or causing them approach the hunter by a particular cry, and then shooting them, is practised.

Of birds, there are very large vultures, various species of falcons and owls, the cuckoo, roller, king's fisher, ducks of several kinds, the domestic goose and turkey, the stork, which arrives at Athens in March and departs in August, partridges numerous, wild pigeons, quails, snipes, teal, blackbirds, the goldfinch, nightingale, the beccafica, a very small bird, the swallow, martin, &c.

The seas, lakes, and rivers, abound with a variety of fish, and the phoca is found on the coast.[5]

Arts and manufactures.

The mechanic arts are necessarily in a rude state in Greece, though the vices of the government do not operate so injuriously upon them as upon agriculture. Numbers and union give a certain degree of security to the artisans of towns, which the rural inhabitants cannot possess. But, on the other hand, these arts can only flourish when they are bottomed on knowledge generally diffused; and when entirely separated from scientific principles, they unavoidably degenerate into empirical processes, which are continued by servile imitation. Accidental circumstances may improve some, and prevent others from retrograding; but they are not so connected as to advance equally, or carry forward each other. This is obviously the case in Greece. Some of the ruder mechanic arts have been created or preserved by the indispensable wants of society; others have been imported to minister to the luxury of the great; and a few seem to be fragments saved from the wreck of former knowledge. Hence trades and professions equally necessary are exercised with very different degrees of skill, and seem to belong to different stages of social life. On the other hand, travellers sometimes mislead us, by not sufficiently attending to the fact, that the household furniture of the Turks or Greeks, and the implements and accommodations required for every situation and employment, are few and simple compared with ours. Works, however, are executed requiring much more skill than many others, the want of which is sometimes referred to as a mark of barbarism. The agents of the British ambassador could not procure a wheeled cart or a ladder in Athens; but it ought to be recollected, that the Greeks, who inhabit a mountainous country, with steep unpaved roads, have some reason for employing pack-horses instead of wheel carriages, as we did in Scotland sixty or seventy years ago; and if the tradesmen who construct the mosques, the baths, and the palaces of the pashas, would not or could not make a cart or a ladder, it was certainly not from want of skill, but want of practice.

It would be absurd to compare the manufactures and mechanic arts of Greece with those of England or France;

[5] Walpole, 73–77; Chandler, 126; Pouqueville, chap. xvii.

but they are probably little, if at all, inferior to those of Hungary or Poland. In the villages and small towns, carpenters use no other instruments than a saw, a hammer, and a hatchet; and it is only in large cities that gouges and chisels for making mortices are employed. Artists, however, and tradesmen, are found capable of constructing water and wind mills, and building bridges. The churches and mosques are often substantially built and well finished, though designed in bad taste. The palaces of the pashas are generally executed in a very sumptuous style; they are beautifully wainscotted, have marble floors sometimes inlaid, are adorned with good carved work and gilding, with paintings not at all despicable, and with various decorations, which would be thought handsome even in the west of Europe. The baths, fountains, and sepulchral monuments, also display some good architecture. In some few cases it is probable these works are executed by foreign artists. Ships of considerable burden are built at Hydra and Spezzia. There are goldsmiths among the Greeks and Turks, who can combine the metals, and execute devices neatly enough upon sword-belts and scabbards, though their workmanship is inferior, in taste of design and delicacy of execution, to that of English and French artists. Knives and forks are made at Athens, daggers and other articles of armoury at Mistra. Good pottery, resembling the ancient in purity, brightness, and elegance, is made at Larissa. The saddles, bridles, and housings of the Turks, are well made, according to their fashion, and elegantly embroidered. The Greeks paint in fresco, by a peculiar process, and are possessed of a method of painting in wax, and fixing the colours with heat, which has been thought to be substantially the same with the ancient encaustic painting. The fabrication of images of saints is a considerable branch of manufacture. They are formed mechanically from a model or prototype, which is handed down from father to son; and hence the remarkable uniformity of feature in these images. The Greeks of Yanina and other places embroider well on stuffs of various kinds; and the artisans of Larissa, Yanina, and Salonica, have long excelled in the preparation of Turkey leather. Soap is made at Tripolizza; the art of dyeing is practised in many places with much skill, and in particular the secret of giving a fast red colour to cotton was long confined to the Greeks of Thessaly, though now known both in France and England. The cloth manufactures of Greece are chiefly of a coarse kind, for home consumption; but they embrace also some articles of a finer description for exportation. A silken robe, of very delicate net-work, made in Greece, is believed by Beaujour to be the same sort of fabric as the ancient *gauze of Cos*, or *cloth of air*, except that the latter was made of linen. Ten thousand of these are annually exported from Salonica to other parts of Turkey. Shawls for turbans, serges, velvets, satins, and various silk and cotton stuffs, are made at Tornavos in Thessaly, at Tripolizza in the Morea, or other places. The carpets of Salonica, though inferior to those of Smyrna in brilliance of colour, are equal in quality, and are much esteemed in the west of Europe. Of woollens, the principal manufactures consist of coarse fabrics, called *abats*, used for clothing by the peasantry, and of carpets or cloaks, an article in universal use among the Albanians, and also in great demand among the mariners of the Levant. These are chiefly made by the Wallachians, and other inhabitants of the mountainous parts of Albania, Thessaly, and Macedonia. But the species of manufacture which probably employs the greatest number of hands is the spinning and dyeing of cotton yarn. In Thessaly and Macedonia, 20,000 bales, or 5,500,000 pounds, of cotton were spun annually. The large village of Ampelakia, which overhangs the defile of Tempe, containing 4000 inhabitants, was entirely supported by this manufacture; and it forms the most considerable branch of industry in Tornavos, Larissa, Pharsalus, and in all the villages on the declivities of Ossa and Pelion. Of the yarn, a large proportion is sent to Germany. In general, the manufactures of Greece are carried on by mere manual labour, without combination, and without the aid of machinery; and, considering the disadvantages they labour under from these circumstances, it is rather matter of surprise that they are so extensive. The most industrious provinces are Thessaly, Macedonia, Albania, the Morea, Attica, and Livadia. The western part of Bœotia, with Phocis, Locris, Ætolia, and Acarnania, are totally destitute of manufactures.[1]

Physic is practised partly by Greeks who have received some education in Italy, and partly by Italians. Many of them, however, have received no education at all, but are adventurers, who, having failed in trade, put on the Frank habit, which all the physicians wear, and commence practitioners. With a few exceptions, they are extremely ignorant and prejudiced; and their practice is limited to the use of bleeding, and a very few remedies. If the disease does not yield to these, the papas is called in, and recourse is had to exorcism. Surgery is chiefly in the hands of the Albanians, who have skill enough to reduce fractures and dislocations, but never attempt amputations, or other operations of any difficulty.[2]

Commerce.

Greece, deeply indented on three sides by arms of the sea, encircled by numerous islands, and having its inland communications obstructed by mountains, has a natural tendency to become a commercial country; and, from various causes, its foreign trade has suffered less from the wretched policy of its government than either its agriculture or manufactures. The foreign merchant always assumes, in a certain degree, the character of a citizen of the world: Having his capital scattered over many countries, only a small part is within the grasp of tyrannical rulers at one spot; and, when oppressed or disturbed, he can, with greater ease than any other person, transfer his wealth and industry to some other place where they will be more secure. Originally, the commerce of Greece was carried on almost entirely by foreigners, whom the Turkish government found itself compelled to treat with some degree of respect; and the Greeks, who latterly engaged in it, partly by procuring protections from foreign powers, and partly from the force of custom, insensibly acquired a share of the consideration and the privileges enjoyed by the class to which they belong. What contributed perhaps still more to their security was, that they were exempted from any immediate collision of interest with the Turks, who, from their aversion to foreigners, arising out of their religious bigotry, almost entirely abandoned commercial pursuits. The only exception to this was, that the beys and pashas, with the usual short-sighted cupidity of despotic power, monopolized in many cases the sale of the most considerable articles of export, such as corn and oil; and they of course greatly cramped the growth of these branches of trade. The Greeks are gifted in a peculiar degree with the practical sagacity and address required for conducting mercantile transactions; and finding the paths to distinction, and the pursuit of national objects, closed against them, their activity and enterprise flowed more abundantly into the channel of commerce. The ruin brought upon many foreign houses engaged in the trade of Greece, by the fluctuations and revolutions in the west of Europe during the last thirty years, threw a great portion of it into the hands of the Greeks themselves. And the annihilation of the commerce of France, Spain, and Italy, for a long period, by the ascendency of the British marine, gave the Greek traders a new and extraordinary importance as neutrals. Before the revolution, there were individual houses of this nation who had branches established in three or four of the chief commercial towns of Europe, and their ships made voyages as far as America. Within this period, too, the small barren rocks of Hydra and Spezzia, off the coast of Argolis, became the seats of an extensive and flourishing commerce, and rose suddenly to extraordinary wealth. In 1812, the former had 25,000 inhabitants entirely supported by trade, with about three hundred trading vessels, some of them as large as 500 tons.[1] The larger vessels were generally built at Fiume. Funds were supplied for fitting them out by capitalists residing in the island, who had acquired fortunes in trade, and lent out their money at ten, fifteen, or twenty per cent. The captain was generally a principal owner, and every person on board, down to the cabin boy, had a share in the speculation. (Holland, 424.) The Hydriotes purchased the right of electing their own magistrates from the porte, and they some years ago expended ten thousand pounds in building their town-house. (Hobhouse, p. 599.) Spezzia approached to Hydra in commercial importance, and Psyra had also acquired consideration by trade. The same cause which raised these places to consequence created a new trade of a very singular kind at the port of Salonica. Colonial goods, when the usual channels by which they were admitted to the Continent were closed in 1810, 1811, and 1812, were sent to Salonica by sea, and thence forwarded overland to Vienna by a route of 700 miles in length. The goods were transported on horseback; the journey generally occupied thirty-five days, and the expense was supposed to add about 100 per cent. to the import price of the articles at Salonica. In 1812, thirty cargoes came direct from England to Salonica, besides a still greater number from Malta and Gibraltar, and cavalcades of a thousand horses sometimes set out at once for Germany. (Holland, p. 323.) The Greek vessels were found trading in Egypt, Syria, Asia Minor, the Black Sea, and the Sea of Marmora; and a vast number of small craft plied among the islands of the Archipelago, and between these islands and the Continent. Thiersch estimates, that the internal and coasting trade of Greece employs 2000 small vessels, and 40,000 mules and asses. (*Etat actuel de la Grèce*, 1833, ii. p. 72.)

[1] Beaujour, let. 1, 2, 14, 15, 16; Thornton, 16–28; Clarke, vi. 273, 280, vii. 344; Hobhouse, 75, 69; Eton, 232; Holland, 123, 133, 265, 288; Pouqueville, chap. xvii.

[2] Pouqueville, 194; Hobhouse, 535; Holland, 164.

The commerce of Greece with the other parts of the world is chiefly carried on by sea; but with Germany a considerable traffic is maintained by land. The town of Salonica, which is situated in the centre of the most fertile, populous, and industrious districts, Macedonia and Thessaly, is the principal seat of this commerce. As a trading city it rivals Smyrna, and is probably inferior only to the capital. The other most considerable ports in Greece are Orphano, at the head of the Gulf of Contessa, Volo in Thessaly, Athens, Nauplia in Argolis, Calamata, Coron, and Patras in the south and west sides of the Morea, Salona on the north side of the Corinthian Gulf, Arta, Butrinto, Avlona, and Durazzo in Albania. The exports, which consist principally of raw produce, are corn, cotton, tobacco, olive oil, timber, wool, silk, honey, currants, figs, hides, dyestuffs, drugs, with some wine, cheese, butter, live cattle, spun and dyed cotton, some capots or cloaks, carpets, coarse woollens, and a few slight fabrics of silk and cotton. The manufactured articles go chiefly to the other provinces of Turkey. The imports from western Europe consist of manufactured goods, colonial produce, and peltry; those from other parts of Turkey, of coffee, flax, timber, rice, drugs, and some manufactured articles; those from Barbary, bonnets and slaves. Both imports and exports pay a duty of three per cent. if the merchant is a foreigner; but by a strange inversion of ordinary rules, the duty is from five to ten per cent. if he is a native. The goods imported are circulated through the country by fairs held in the great towns, and are transported from place to place on the backs of horses, mules, and sometimes camels. The prices are of course greatly enhanced by the risks attending carriage, and by the high rate of interest paid on capital, which is generally twelve per cent. in commercial transactions, and twenty per cent. in other cases. (Beaujour, let. 23, 24; Holland, 227, 326.)

In the ten years from 1787 to 1797, about one half of the foreign trade of Greece was with Germany. It was chiefly conducted by Greeks, and Vienna and Salonica were the principal entrepôts. The Germans took cotton, raw and spun, from Greece, and returned light woollens, linens, muslins, glass, cutlery, &c. to the value of one third of their imports, and the other two thirds in specie. The Italian commerce, which is next in importance to the German, is carried on chiefly with the ports of Leghorn and Venice. It supplied Greece with fire-arms, glass, paper, silks, &c.; Russia sent silks and peltry; France, woollens, bonnets, gold lace, sugar, coffee, and indigo; Holland, cloth and spiceries; and England, woollens, muslins, linens, metal wrought and unwrought, watches, trinkets, jewellery, and colonial produce. (Beaujour, let. 17, 23.) Except Russia and England, all those states make a part of their returns in specie. The late long wars, however, have made a considerable change in the distribution of this trade. The new establishments of Britain in Malta and the Ionian Islands must have transferred to her a part of what was formerly in the hands of the French and Italians.

Cotton.

Cotton, according to Beaujour, ranks first among the staple exports of Greece, and four fifths of the trade in this article is conducted at Salonica. On an average of the ten years ending 1797, the district of Seres in Macedonia, where the most extensive cotton plantations in Greece are, furnished 50,000 bales, or 5,000,000 okes, for exportation, of which three fifths went to Germany. The price varied from 80 to 160 aspres the oke, or averaged about a piastre. But in 1809 the export of cotton from Salonica amounted to 110,000 bales, or 11,000,000 okes, and the price having risen to sixty, eighty-five, and even ninety paras, must have averaged nearly two piastres the oke. The export of the Morea, which, according to Pouqueville, consisted, about 1800, of two cargoes, probably 400,000 okes, must have increased from the same causes, and might be estimated at 600,000 okes. About 72,000 okes were shipped from Salona in 1805. Considerable quantities of cotton are raised in Albania, and more in Thessaly; and though a great proportion of these is consumed within the country, a part is exported by the ports of Volo, Arta, and probably also by Butrinto and Avlona. If we add for the exportation of these districts a quantity double of that of the Morea, or 1,200,000 okes, we may form a loose estimate of the whole export of cotton from Greece, which would thus amount, about 1809, to 12,872,000 okes, or 35,398,000 pounds,—a quantity nearly equal to what was exported by the United States in 1805. The value of this, estimated at one and three fourth piastre the oke, would be 22,526,000 piastres, or about L.1,200,000 sterling (taking the piastre at 1s. 1d., the value given by Dr Holland, from whom most

---

[1] Holland, 424. Mr Hobhouse, who travelled in 1809, says, that Hydra could furnish men for 80 vessels of 300 tons, Spezzia for 60 (p. 600). With a small allowance for increase in the intervening period, perhaps the two statements are not inconsistent.

f the statements are taken). The opening of the Conti-
ent, however, in 1813, for the admission of West Indian
nd American cottons, produced a great diminution in this
ranch of trade; but the details are interesting, as showing
e commercial spirit of the people, and indicating the
rides their trade may be expected to make under more
avourable circumstances.[1]

The trade in tobacco, of which Salonica is also the chief
eat, seems to have latterly declined. Beaujour estimates
e annual export of this article, between 1787 and 1797,
t 60,000 bales, which went chiefly to Egypt, Barbary,
taly, and Germany; but Dr Holland, who travelled in
812, estimates it only at 30,000 bales, or 3,000,000 of okes.
he Morea, and the southern parts of Greece, generally
aise little tobacco, but import a great part of what they
se from Macedonia and Anatolia. Albania and Thessaly,
owever, yield a large produce, and export to some extent.
Vc have no account of the precise quantity, but if we sup-
ose it to be one fifth of what is shipped at Salonica, the
hole export of this article would amount to 3,600,000
kes, which, valued at thirty-six aspres the oke (about 1¾d.
e pound), including custom-house duties, would amount
o 1,080,000 piastres, or L.67,500.[2]

The exportation of corn to foreign countries is prohibit-
d in Turkey, but is carried on to a great extent clandes-
inely, by the beys and pashas themselves, or by merchants,
o whom they sell, for a large sum, the privilege of violating
e law. During the unsettled state of the west of Europe
e trade of Greece in corn seems to have increased ra-
idly. According to Beaujour, the export from the fertile
rovinces of Thessaly and Macedonia, by the ports of Sa-
onica, Orphano, and Volo, consisted annually of eighty
argoes to other parts of Turkey, and forty to France and
taly, making in all 1,200,000 kilos. In 1809 Dr Holland
stimates the export from Salonica alone at 1,000,000 kilos
f wheat, 500,000 barley, and 100,000 maize, altogether
qual to about 200,000 quarters. About fifty cargoes of
heat and maize were sent from Arta to Sicily, Malta, and
e Ionian Isles; 100,000 kilos from Salona, and 250,000
rom Livadia. The Morea, according to Pouqueville, sent
ut eight cargoes, or, according to Scrofani, about 240,000
ilos. If we put these quantities together, taking the car-
o, according to Beaujour's valuation, at 10,000 kilos, and
llow for the exports of Thessaly by the Gulf of Volo
which are not included in Dr Holland's statement), and
f North Albania by Avlona, Durazzo, and other ports, a
uantity equal to what is shipped at Arta, we shall have
or the whole export of continental Greece in corn before
e revolution 3,190,000 kilos, or 400,000 quarters. The
reater part of this consisted of wheat, the price of which
as latterly from five and a half to six and a half piastres
e kilo. Beaujour states the value of bread corn in his
ime at two and a half piastres; and Scrofani reckons the
rain of all kinds exported from the Gulf of Arta worth
hree piastres the kilo. If we assume the average in 1809
o be four and a half piastres, the value of the whole ex-
ortation would be about 14,950,000 piastres, or L.809,700
terling.[3] This may be considered as the true value of the
rain, only a small share of which, however, goes into the
ocket of the grower, imposts and exactions by the public
fficers absorbing the greater part. Considered in refer-
nce to the extent and circumstances of the country, the
xportation now stated is very large. Estimating the whole
opulation at 2,500,000, and allowing a septier of corn (about four and a half bushels) to each, according to Beaujour's calculation,[4] the whole consumption will only amount to 1,400,000 quarters; and the corn exported will form nearly one fourth of the entire produce.

Wool.

It has been stated that only a small proportion of the wool of Greece is wrought up in the country; but the amount of the export does not seem to warrant this assertion. From Salonica, according to Beaujour, the quantity exported is about 500,000 okes annually; from Salona, in 1805, it was 140,000 okes; from the Morea, according to Pouqueville, two cargoes, or, according to Scrofani, 340,000 okes. As sheep-farming is a leading occupation in Thessaly, and still more in Albania, the quantity exported from these countries (independently of what is carried inland to Salonica), and from Ætolia and Attica, cannot be less than from Macedonia and the Morea together; and, on these data, the whole export of wool may be loosely estimated at 1,800,000 okes (4,950,000 pounds), which, at the average price of twenty paras the oke, is worth about L.56,000 sterling. Considering the reputed number of flocks in Greece, and the small proportion of the wool said to be used in domestic manufactures, this estimate is probably below the truth. The Jews of Salonica, who were refugees from Spain two centuries ago, obtained from the Ottoman government the privilege of buying up one fifth of the wools grown in Macedonia, at four paras the pound; and this oppressive privilege they were permitted to retain and abuse to a late period.[5]

Oil.

The exports of Attica in olive oil, according to Beaujour, were 150,000 measures (of twelve pounds each), or about 14,000 barrels, at forty-eight okes to the barrel. Those of the Morea, according to Scrofani, were 21,000 barrels; Salona, in 1815, shipped 5000 barrels; and large quantities were sent out from the Gulfs of Volo and Arta, from Avlona, and probably from Salonica and Orphano. Considering the extent to which this tree is cultivated over all Greece, the annual produce for exportation would certainly be moderately estimated at twice the amount of the quantities above enumerated, or 80,000 barrels. The value of this, at twenty piastres the barrel, is L.100,000 sterling.[6]

Currants.

The commerce in currants centres chiefly in Patras, from which, according to Beaujour, 8,000,000 pounds were annually exported, the total value of which, at eighty piastres the thousand pounds, is L.40,000 sterling. Dr Holland states the export from Patras at 5,000,000 pounds, Scrofani at 6,000,000. (Beaujour, let. 8; Holland, 433.)

Miscellaneous articles.

The only exportable commodity worth naming possessed by Attica, besides oil, is its honey, which is famed over all Turkey. Of this article and wax it exported to the value of 100,000 piastres. Twenty or thirty cargoes of timber were sent from the Gulf of Arta, besides large quantities from Macedonia and Thessaly; and from one or other of these districts were also exported silk, wine, hare-skins, honey, opium, drugs, bees-wax, carpets, and some capots, and other coarse woollen cloths. Vermilion and madder are exported from Livadia. Of the nature and extent of this trade we can only form a judgment by referring to that of the Morea. Besides the produce of corn, oil, currants, cotton, and wool, formerly mentioned, the Morea exported on an average, according to Scrofani, silk, to the value of 407,000 piastres; cheese, 459,000 piastres; cattle, 240,000; fruits, 139,000; dye-stuffs, 202,000; wax and honey, 140,000. These, with smaller articles, to the value of 238,000 piastres, make a total of 1,725,000 piastres. From this must be deducted the value of goods sent to other parts of Greece, supposing it to equal the imports of the same description, viz. 316,000 piastres, which leaves 1,409,000 piastres. If we suppose the trade of the north of Greece in these miscellaneous articles to be three times as great as that of the Morea (the ratio of the population is about five to one), or 4,227,000 piastres, we have a sum of 5,950,000 piastres, or L.377,000, to add to the value of the exports of Greece, in the great articles formerly enumerated,[1] and the whole will stand thus :—

Olive oil	100,000
Currants	40,000
Miscellaneous articles	377,000
Total exports of continental Greece before the revolution	L.2,649,700

We are sensible that so many uncertain elements enter into this table as to detract greatly from its authority; but the reader is aware of the data from which it is compiled, and can judge for himself. The multitude of particular facts, given by different travellers, seem to be of little value, except as materials for some such general estimate; and the writer of an article of this kind is evidently in a better situation to form such an estimate than an ordinary reader.

With regard to this amount, it is proper to observe, that it refers to the period of 1809, when the commerce of Greece was forced up to an unnatural magnitude by the singular state of western Europe. The peace of 1814 reduced both the quantity and value of the cotton and grain exported, probably to the extent of a third or more, and the trade of Southern Greece was almost annihilated by the revolution. We may remark farther, that the sum expresses the value of the articles to the foreign purchaser at the place of export, which includes duties and charges, amounting, in some cases, to one third of the value; and, with regard to the article of corn, a considerable part is carried away without payment, as the produce of a tax; another part is forced from the grower, at a fifth or sixth part of its value, for the supply of the capital; while the sale of the remainder is either monopolized by the beys, or subjected to an arbitrary impost, paid as a bribe for permitting the exportation, in violation of the law. (Beaujour, vol. i. p. 119.) So great a proportion of the value is diverted into the pockets of the various classes of public functionaries, that the effect of the exportation, in stimulating domestic industry and production, is infinitely less than the aggregate amount would lead us to suppose. But when the extent and population of the country is considered, and the multiplied discouragements to industry, arising out of the government and state of society, the trade was surprisingly great, and shows what a high rank Greece may attain, as a commercial state, when her industry is unfettered, and enjoys security under a good government.

Shipping and seamen.

Though still proceeding on conjectural grounds, we may venture a step farther, in order to get at some idea of the naval resources of the Greeks. If we take the imports of the Morea (given by Scrofani) as a basis for the whole country, we should conclude that the trade of Greece, with other parts of Turkey and Barbary, is to her trade with foreign nations nearly as five to four. And, in a period of war (1809), when the Greeks appeared in the character of neutrals, it is probable that the whole of the former trade, and two thirds of the latter, would be carried on in Grecian bottoms. In this and other particulars the commerce of Greece bore a general analogy to that of America, both countries exporting raw produce of the same kind, and importing manufactures, and both acting in the character of neutrals. On the ground of this resemblance, we will suppose the coasting trade of Greece and its islands to employ about half the tonnage of its other trade. In 1810 we find the whole tonnage of the United States (foreign and coasting) was, to its exports, in the proportion nearly of one ton to forty-eight dollars; but, allowing for the inferior efficiency of Greek shipping, and the difference in the value of money, although their voyages are shorter, we may assign one ton to thirty-six dollars, as the proportion in the latter. This gives about 340,000 tons of shipping, of all sizes; and since the danger from pirates, as well as their own want of nautical skill, oblige the Greeks to employ an extra number of hands in their vessels, we may allow one man to ten or twelve tons, which will give 30,000 seamen. If we add half as many more for the Greek mariners employed at Constantinople, Smyrna, and other ports beyond the limits of Greece, the whole number of mariners of this nation, in 1809, may be estimated at 45,000, which does not fall greatly short of the number mentioned by Mr Hobhouse. More than one half of this commercial marine must have disappeared during the troubles of the revolution; but more prosperous times may recal it to existence.

Wages of labour.

The proportion between the rate of wages and the price of commodities in Greece affords an illustration of the dependence of the former on the habits of the population. The numerous fasts of the Greek church keep the peasant idle a great part of the year; and the consequence is, that, as he must have the means of subsistence, his wages, during the time he labours, are so much higher. Thus, Beaujour tells us, that, in his time (from 1787 to 1797), the wages of a peasant were from twenty to twenty-five paras a day, and of an artisan, thirty to forty paras; and, at the same period, beef was sold at six, mutton at twelve, and bread at four paras the oke (two and three-fourth pounds); and corn was two and a half piastres the kilo or bushel. Supposing a full-aged labourer to consume six or seven kilos of corn in the year, he observes, that such a person could earn bread for himself, for a whole year, in thirty-six or forty days, and food of all kinds in eighty; that he could provide subsistence for himself and his wife in a hundred and sixty days; and for a child besides in forty days more. The vast number of fasts, as he remarks, are the chief cause of these high wages, which do not enable the labourer to live well, but to live idle, and indulge his superstitious feelings. (Beaujour, ii. 168.)

Provincial governments.

The provincial governments of Greece bear the different denominations of pashalik, mousselimlik, agalik, voivodalik, according as they are administered by pashas, mousselims, agas, or voivodes. The pashas are the first of these functionaries in rank, and govern the largest districts; the others follow in the order in which they are named. The agas often take the title of Bey, though that belongs properly to military commanders one degree higher. The most essential distinction between them regards the extent of the districts they govern; for they are all independent of one another, and accountable separately to the general government. Each, as vicegerent of the sultan, exercises the full powers of sovereignty within his own district. This seems to be the theory of the government; but as theory and practice seldom coincide in Turkey, we find that in some districts the beys or agas are, to a certain extent, dependent on the pashas. The limits and the numbers of these provincial governments are often in a state of fluctuation, in consequence of the hostilities which the beys and pashas carry on against one another. The enterprising ambition of Ali, the late pasha of Albania, nearly obliterated all the ancient political divisions of Northern Greece. In 1812, the provincial governments consisted of five pashaliks, two voivodaliks, and a number of smaller districts, governed by beys, or officers of inferior rank. These were, 1. The pashalik of Albania, comprehending the territories which formerly constituted the pashaliks of Lepanto, Arta, Yanina, Delvino, Ocrida, Avlona, with the mousselimlik of Larissa, and several towns and small districts governed by beys, agas, or voivodes; the whole comprehending the ancient Epirus, Acarnania, Ætolia, Phocis, the greater part of Thessaly, the southern division of Illyricum, and the western divisions of Macedonia and Bœotia. 2. The pashalik of Scutari, consisting of the country watered by the Drino, a part of the ancient Illyricum. 3. The pashalik of Salonica, including all the lower part of Macedonia, except the districts belonging to the pasha of Albania. 4. The pashalik of Negropont, consisting of the eastern part of Bœotia, and the island of Eubœa or Negropont. 5. The pashalik of Tripolizza, comprehending all the Morea, except some maritime towns and districts. The pasha had under him twenty-four officers, governing the different cantons, some named beys, and others codjia-bashees or elders. 6. Attica and Livadia were each governed by a voivode. 7. The high country of Macedonia is divided among a number of beys or agas. 8. The small territory of Zagora, the ancient Magnesia, was under the government of the Greek primate of the country. 9. The district of Maina, in the Morea, was disjoined from the pashalik of Tripolizza, and though nominally subject to the capitan pasha, actually enjoyed a great degree of independence under the sway of its own beys, who are twelve in number, and live much in the condition of feudal barons. 10. All the Greek islands, with some maritime districts on the mainland, were under the authority of the capitan pasha. This enumeration of the provincial governments is not very complete, but may give an idea of its interior government before the revolution.[1]

---

[1] Beaujour, let. 6, 9–11; Holland, 84, 389; Clarke, vii. 465–8; Pouqueville, 411.

The civil polity of the Turks is in substance the discipline and arrangements of a Tartar camp applied to the government of a nation. The pasha, like the commander-in-chief, determines every matter, civil, military, and judicial, with summary dispatch, and without reference to any other rule than his own untutored conceptions of right and wrong. Questions not of a criminal nature, however, between subject and subject, are decided by the mollah or judge, whose jurisdiction extends over both Turks and Christians. In the tribunals of these functionaries, bribery is almost open and avowed, and false witnesses form something like a regular profession. The gainer of a suit pays the whole expenses. The Turks themselves, aware of the notorious corruption of the courts, rather submit to injustice than seek legal redress. Avanies, or vexatious prosecutions instituted against Christians, for the purpose of compelling them to pay a sum of money as the price of abandoning the suit, are a regular source of revenue to the Turkish inhabitants of towns. The police of the Turks is as rude as their judicial system. An officer accompanied by soldiers traverses the markets in the great towns, and if he detects any person selling with false weights, the defaulter receives the bastinado for the first offence, is nailed by the ear to the door of his own shop for the second, and hanged for the third. Their attempts to correct evils often produce others of much worse description. If a complaint is made by some person of consequence, of a robbery committed, an enormous fine is levied on the district where it happened; or, what is still worse, a party of soldiers is sent out, who, under the pretext of searching for the robbers, oppress and plunder the peasants without mercy. An officer, named *dervendji-pasha*, charged with the inspection of the roads and bridges, makes an annual tour through the country, accompanied by a party of soldiers; but his inspection serves no other purpose than to extract money, under the name of fines, from the people, to fill his own pockets, while the roads and bridges are utterly neglected. Indeed all classes of public officers practise extortion, and Turks, Greeks, and Jews, are almost equally sufferers. Public offices are regularly sold to the highest bidder, and those who buy them of course reimburse themselves by one means or another. As the appointments are annual, the price is paid over again every year; and the only method of redress which is open to a city or district that is oppressed, is to offer a greater sum for the removal of its governor than he gives to obtain the renewal of his office. Very often, after an aga has amassed great riches, the Porte allures him into some large town, by the bait of a splendid employment, and there strips him of his wealth, and perhaps awards him the bowstring. The pashas live surrounded with a degree of pomp and splendour, which contrasts strangely with the squalid wretchedness of the people they govern. They are approached with prostrations, like eastern monarchs. Their places of residence are vast buildings, forts without, and palaces within, capable of containing a thousand or twelve hundred men. Besides a strong body of soldiers, they are filled with an immense retinue of servants, including menials, tradesmen, and artists; such as coffeemakers, sherbetmakers, confectioners, bathers, tailors, barbers, dwarf pages, black slaves, buffoons, musicians, puppet-showmen, wrestlers, conjurors, dancers, an imam (or priest), and, lastly, the executioner, the pasha's confidential servant, without whom he never stirs abroad, and who is the only person privileged to sit in his presence. In addition to all this, the harem, or women's apartments, forms a separate establishment, with its own train of servants. A pasha of Salonica, not peculiarly profuse in his habits, has been known to expend L.24,000 per annum on his domestic establishment. The mousselims, agas, and beys, support the same state in proportion to their circumstances. Wars are as common among these petty rulers as among the old feudal barons, and as destructive in their effects. The Porte, by a miserable policy, foments their quarrels, to weaken them individually, and increase their dependence on itself. The people, ruined by exactions, or the ravages of the military, abandon their homes, and fly to the mountains and forests, where they commence robbers. In some places the rural inhabitants live in houses which are built like small forts with draw-bridges and battlements. In addition to all the evils common to them with the Turks, the Greeks have many peculiar to themselves. They are made to feel their degradation by the most opprobrious distinctions. They are marked out by a peculiar costume, and are not allowed to wear certain articles of dress, or clothes or slippers of a light colour, or to paint their houses of those colours which the Turks use. It is death for a Greek to marry a Turkish woman, or to strike a Mahommedan even in self-defence. One of the lowest Turks will dismount from his horse, force a Greek from his shop, load him with his baggage, and compel him to follow him, without the poor Greek daring to utter a complaint. The wealthiest individuals of this nation are exposed to the most galling insults in their own houses. Dr Holland mentions, that while he was sitting with the Archbishop of Larissa, the most considerable Greek in Thessaly, a Turk of a surly and forbidding aspect, and evidently of the lowest class, entered the room, seated himself unceremoniously on the sofa, filled his pipe, and took coffee from the attendants. The archbishop was evidently embarrassed, but made no comment. After a short interval, he took a coin from his purse, and put it silently into the hand of the Turk, who immediately disappeared. In general, the inhabitants of the districts which are appanages of the great officers of state, of the *timars* or fiefs held under the sultan, and of the lands belonging to the church, are less oppressed than the others. The islands of the Archipelago, where Turkish governors do not reside, are also less disturbed; and mountainous districts, such as Maina, which are capable of being defended, are sometimes nearly in a state of independence. Local differences, indeed, in the political condition of the people, are numerous in Greece. Where the Christian inhabitants have wrested certain privileges from the Turks, they generally enjoy them undisturbed, from the mechanical adherence of the latter to habits once formed. Very often the degree of freedom and security which the Greeks enjoy depends on their numbers. In towns where they form a large part of the population, as in Athens, their numbers and union give them consequence, and their superior knowledge and address enables them successfully to elude or oppose the sluggish tyranny of the Turks.

---

[1] Beaujour, let. 1; Pouqueville, chap. x.; Thornton, p. 122; Hobhouse, let. 14, 17.

The redeeming feature in the civil polity of the Turks was their municipal institutions, which, growing out of the anarchy of the government, proved to some extent a compensation for its oppressions. The conquering nation, too proud and indolent to concern itself much about the local and domestic concerns of the subject race, or to resort to disguised and indirect taxation, was content to fix the amount of tribute which each district should pay, leaving the rayahs to raise it in what manner they pleased, and to adjust such disputes as arose among them by the laws or usages to which they were accustomed. Hence every considerable Greek village, or every three or four where they were small, form a municipality, the inhabitants of which meet and choose, by open suffrage, magistrates under the name of primates or elders. They consist generally of the richest men in the district; sometimes they are chosen annually; sometimes for no definite period; but if they misbehave, they are deposed by the votes of the people, without regard to any term. Their functions are numerous and important. They apportion the tax imposed upon the whole community to each individual according to his property, and for this purpose they make it their business to ascertain each man's means of living, his industry and profits. It is their duty, by admonition or reproof, to prevent the negligence or misconduct of any individual from adding to the burdens of the rest. They assess and collect the poll-tax, house-tax, land-tax, and other imposts, which, in their mode of collection and repartition, vary in almost every village, but always depend on a scale of property. They manage the municipal funds raised for indemnifying families upon whom Turks have been billeted, for supplying provisions to troops passing through the place, and for defraying the expenses of the local administration. They borrow money on their own responsibility to discharge occasional demands of the government, or unexpected emergencies. They distribute lands left uncultivated or without heirs; they legalise contracts by affixing their signatures to them; and, jointly with the priests (also popularly chosen), they adjust quarrels, settle civil disputes, and exercise in some degree the powers of police judges. The village communities in Turkey, in short, resemble those in India. They are small associations framed on a republican model, paying a fixed annual tribute to a superior ruler, but possessing the power of regulating their internal affairs, almost uncontrolled. Such institutions, as they unite the people, by a sense of common interest, in furthering the good of each other, operate strongly to secure property and develope industry; and such was no doubt the secret of the wonderful prosperity exhibited by Hydra, Spezzia, Ampelakia in Thessaly, Seres in Macedonia, and other villages in Greece. Though Mr Urquhart, who first brought the nature of these municipalities fully to light, has perhaps overrated their advantages, there is no doubt that they contributed greatly to counteract the evils springing from the ignorance and rapacity of the Turkish government.[1]

Military force. The Turkish government being purely military, the privilege of carrying arms is considered a mark of distinction, and is reserved entirely to the Turks. Nearly the whole of this part of the population belongs either to the *toprakli* (feudal militia) or to the corps of janizaries. A Mahommedan unconnected with any military corps is, equally with Christians, liable to capitation-tax and other imposts; and this law, though not rigorously enforced, induced most of the Turks to enrol their children in their infancy. Hence in the cities every Turk was a janizary. But only a very small number of these were embodied; the whole corps of janizaries in actual pay in the empire having been only about forty thousand, according to Mr Thornton. They served in garrisons, and generally followed some trade. Their pay was originally about one shilling a day, and, though it continued nominally the same, was ultimately, from the depreciation of the coin, reduced to a fractional part of this sum. Small companies of *topgis* or artillerymen were also placed in the garrisons, but they were totally ignorant of gunnery; and very often the guns were without carriages. The *yamacks* or unembodied janizaries, and spahis, served merely to fill vacancies in the standing corps, and furnish extraordinary levies in time of war. These levies were made at the rate of one man out of ten persons of the families attached to the military bodies. When called upon for active service, they marched without uniforms, armed with fowling-pieces, pistols, lances, or such weapons as they could find. The Albanians, from greater practice in war, were better organized, though destitute of what would be considered discipline in regular armies. Many of the pashas, indeed, keep in their service a corps of Albanians, who have become the principal and far the most efficient part of the Turkish military in Greece. We do not find any accurate account of the amount of the military force actually kept on foot in Greece, or of the contingent furnished by it for the general service of the empire. But the pashalik of Salonica, with the mousselimlik of Larissa, which have a population of 500,000 souls, Greeks, Jews, and Turks, supplied, in time of foreign war, 15,000 men; and as the proportion of Mahommedans is much greater in these districts than anywhere else, perhaps the contingent for the whole country, including Albania, would not exceed three times this number. But so inefficient was the military administration, that generally not more that one half of the individuals called upon actually joined the army. The late pasha of Albania, the most formidable military power in Greece, had seldom more than 8000 men in pay, according to Mr Hobhouse. But Dr Holland, who wrote at a later period, when Ali's dominions were much more extended, estimates his standing army at 15,000, and thinks he could, for a short time, maintain 30,000 men in arms. As nearly one half of the peninsula of Greece was, at the latter period, subject to Ali, containing a population of

---

[1] *Turkey and its Resources*, by D. Urquhart, chap. ii. 1833.

,200,000 or 1,300,000 souls, the estimate seems extreme-y moderate ; and the whole military force of the country pplicable to any emergency, calculated on the same scale, vould be 60,000 men, or one tenth of the males able to ear arms. The Albanians of all classes possess arms. Those in active service use a sabre in addition to the gun, istols, and poniard which the peasantry carry. Pouque-ille speaks of them as being formed in chiliads or bodies f a thousand men each, which are subdivided into com-anies ; but these companies do not consist of a fixed num-er. They have few cavalry ; and their infantry is with-ut tactics, discipline, or regular order. But they have he military virtues in a degree not surpassed by any na-ion in Europe ; and their impetuous courage has often natched victory from an enemy superior in numbers and echnical skill. They are strong, hardy, active, and en-erprising ; they delight in combats ; are daring in action, ven to rashness, and firm in the midst of dangers.[1]

Such was the composition of the Turkish military force n Greece previous to 1826, when the reigning sultan sup-ressed the formidable corps of janizaries, and organized n army on the principles adopted in Western Europe.

ue.

The public revenues of Greece, like those of other ude countries, consist of a number of imports, raised n a very simple plan, and often so much the more op-ressive for this simplicity. The expedients adopted in ther states to lighten and equalize the pressure of taxes, nd to mitigate their injurious effects on industry, are otally unknown in Turkey. Most of the taxes were nposed in rude times by men skilled in nothing but he use of the sword ; and the paramount authority of ustom, which in Turkey controls equally subject and so-ereign, will not allow of any material alteration. There re, however, local variations, both in the amount of the axes, and in the mode of their imposition. 1. The first f the Turkish taxes is the *miri* or land-tax, which affects qually Turks and Greeks, and consists of one tenth of he gross produce of the soil. Beaujour estimates its ac-ual amount at one twelfth. Vineyards and gardens, with round under cotton, madder, and mulberries, generally ay a composition. 2. A tax on moveables, that is, shops, ouses, furniture, &c. affecting all other classes but Turks ; is assessed in a very arbitrary manner, varying much in ifferent towns, and is estimated by the Greeks to absorb fourth part of their gains. 3. A tax on consumable com-nodities, cattle, provisions, fire-wood, liquors, &c. levied at he gates of towns, at rates probably not uniform. Sheep nd goats pay one para, an ox one piastre, wine two, and randy four paras the oke ; compositions are accepted for ther articles. 4. The karatch or capitation-tax, imposed n all males not Mahommedans, who are above twelve ears of age according to some, above five or eight ac-ording to others. The rate varies from two to ten pias-res, according to the supposed wealth of the person, and nay vary to a still greater extent, as it is levied on the asis of an ancient roll or census, and, when the popula-on of a district diminishes, the rate is raised in order o afford the same annual amount. The officers judge of child's age by putting a cord round its head. The per-on paying receives a ticket, which he is obliged to pro-uce at the gates of towns, and if he fails, he is compelled o pay anew, perhaps with the addition of the bastinado. . A duty on exports and imports, amounting generally o three per cent. when the merchant is a foreigner, and ive or six per cent. when he is a native subject. 6. The roperty of all public officers at their death, and of all persons who die without heirs, devolves to the pasha, on behalf of the grand seignior. By a composition, however, the heirs of a public officer are sometimes allowed to retain his property. 7. Each pasha has generally a number of farms and villages attached to his place, of which he draws the rents. Ali, pasha of Albania, was reported to be the proprietor of four hundred villages, which yielded him L.200,000 per annum. Mr Hughes thinks that one third of the whole cultivated territory belonged to him. 8. The arbitrary requisitions made of horses, forage, and provisions, for the public service, are a productive source of revenue. 9. Large sums are drawn from the sale of public offices, including those of the dignitaries of the Greek church. The inferior clergy are also compelled to pay a sum at their installation. 10. In some provinces, perhaps in all, there is a duty on legal proceedings, amounting to one tenth of the value of the disputed property. 11. *Avanies*, or vexatious prosecutions, and fines levied on districts for crimes committed within their bounds, on the ground that they might have prevented them. This last practice is made a pretext for many grievous acts of extortion and cruelty, the inhabitants being subjected to military execution when they are unable to pay. 12. Sums are wrung from the tributary classes as a composition for working at the highways and fortifications ; but the money passes wholly into the pockets of the public officers. 13. A considerable revenue is derived from escheats, forfeitures, and confiscations ; and a trifling amount from the produce of the mines, all mines being regarded as the grand seignior's property. Lastly, the *istira*, or regulation by which the cultivators are compelled to furnish corn for the supply of the capital, at one fourth or one fifth of its market value, operates as a tax on the husbandman, though it bring little into the treasury of the prince. Many of these taxes are farmed ; but certain districts, as Maina, and certain bodies of men, as the Jews of Salonica, are allowed to make a composition with the government, under which they assess or collect taxes, wholly or in part, themselves. Were we to judge of these taxes by the amount paid in to the government, we should pronounce them extremely light. But the unequal and often arbitrary mode of apportioning and collecting them is sufficient to render the lightest impost oppressive ; and the numberless fraudulent demands for which they afford a cover on the part of the revenue officers greatly aggravate their pressure. From isolated facts stated by various writers, we are warranted to believe that the gross revenue, or the money drawn from the people, is generally double, sometimes triple, of what is paid even to the provincial governments.[2] To the credit of the present sultan it must be said, that since 1824 he has done a great deal to regulate the finances, and remedy the evils of the old system.

We have no account on which the smallest reliance can be placed, of the whole produce of the taxes of Greece ; and the statements with regard to those of particular districts are too contradictory to be received without suspicion. Mr Hobhouse heard the revenues of Ali estimated at six millions of piastres, exclusively of casual levies, a very comprehensive head. Attica has been said to remit annually to Constantinople 700 or 750 purses, of 500 piastres each. According to Pouqueville, two millions of piastres were raised in the Morea, of which only one half was paid in to the pasha. There is very little consistency in these statements. If we take the first as a basis, and assume that Ali's territories comprehended one third of Greece at the period alluded to, the revenue of the whole peninsula might be estimated at eighteen millions of piastres, or L.1,100,000 sterling, exclusive of what are called casual levies. But, from the vigour of Ali's government, his revenue was probably greater in proportional amount, and collected at a less expense, than that of any other provincial ruler. A different mode of calculation would conduct us to a similar result. In the least advanced countries of Europe, such as Spain, Portugal, Austria, Russia, and Sweden, the public revenue, compared with the population, is generally at a rate varying from 8s. to 15s. sterling per annum for each inhabitant; and as Greece is certainly near the bottom of the scale in point of productive industry, her revenue can scarcely exceed the lowest of these rates. Calculating on this principle, and supposing the population to be two millions and a half, the net revenue before the revolution would be L.1,000,000 sterling, and this sum doubled may represent the gross amount extracted from the pockets of the people.[1]

Population. Of the various estimates given of the population of Greece, that of Beaujour has been most generally followed. This writer assigned a population of 700,000 souls to Macedonia, 300,000 to Thessaly, 400,000 to Epirus, 200,000 to Ætolia, Phocis, and Bœotia, 300,000 to the Morea, and 20,000 to Attica, making a total of 1,920,000. We speak of the country as it existed before the revolution. The population of the new kingdom of Greece will be afterwards given. In two particulars this statement seems to require correction. The population of the Morea, since the desultory war of 1770, appears to have been gradually increasing. Scrofani and Pouqueville, who had good means of information, estimate it at 400,000 Greeks, 15,000 Turks, and 4000 Jews. Again, Beaujour appears not to have included under the name of Epirus the district watered by the Drino, or even Northern Albania; and the researches of Mr Hobhouse and Dr Holland have shown that the parts of this country he did include are more populous than he imagined. Perhaps on these grounds we may raise the entire population to 2,400,000. Probably the number of inhabitants was not greater in Strabo's time, if we may judge from the account he gives of the deserted state of the country (lib. vii. p. 322); and the government of the Turks, with all its train of abuses, is probably not more destructive to Greece than that of the Romans was. This population is very unequally distributed. It is densest in the southern parts of Macedonia, in the eastern parts of Thessaly, and in the central and northern districts of Albania. Acarnania is almost a desert; Ætolia is thinly peopled; Attica, including the city, has not more than twenty-five or thirty inhabitants to the square mile. The plain of Argos, and the hilly region of Maina, are the most populous parts of the Morea. As might be expected from the insecure state of the country, single cottages or scattered hamlets are scarcely anywhere to be seen. The inhabitants are always collected into villages or cities; and those who are engaged in husbandry waste a great part of their time and labour in travelling to and from their lands. Hence, in the agricultural districts, the proportion of the inhabitants who live in towns seems unusually large, considering the small resources that trade and manufactures afford. Of 500,000 persons inhabiting the pashalik of Salonica, and the mousselimlik of Larissa, one third, according to Beaujour, live in the large towns. The most fertile districts are not uniformly the most populous. A barren soil in mountainous parts, which afford the means of defence, is often laboriously cultivated, while the rich plains below are neglected.[2]

It would be interesting to compare the modern with the ancient population of Greece in point of numbers. But inquiries with regard to the latter seem to lead into a labyrinth of difficulties, partly from the want of sufficient data, partly from the multitude of errors that have crept into the numerical expressions in the text of ancient authors, and partly from the civil distinctions of citizens, slaves, and strangers, which render the application of particular statements uncertain. It would baffle human sagacity to build any satisfactory conclusion on the mass of discordant details collected by Hume. We shall proceed more securely, if we ground our reasonings on some single statement that is pretty well established. From a variety of circumstances which elucidate and fortify each other, Hume deduces that Athens contained at one period 284,000 inhabitants.[3] Let us suppose this to include also the rural population. Attica was comparatively a barren district; and, exclusively of Eleusis, Megara, and Salamis, did not occupy more than one sixtieth part of the countries to which our statements apply in this article. Its commerce and colonies, however, more than compensated for the inferiority of its soil. Now, if we suppose the other and more fertile, but less improved parts of Greece, to have been peopled only to one fourth of the density of Attica, this would give a population of eight millions and a half for the whole country. Mannert, a German writer, whose opinion is entitled to great weight, estimates the entire population of Attica at 550,000, chiefly on the authority of Athenæus.[4] Without relying much on these calculations, we may observe, that if one amidst a multitude of small states had such a mass of population, her neighbours and rivals must have possessed something like a proportionate strength to preserve their independence. And, considering the strong feeling of emulation which pervaded these small republics, we may be certain that, before the arts of industry could be so far advanced in Attica as to enable such a mass of people to subsist on so small a surface, the neighbouring states must have been considerably improved.

---

[1] The ancient Athenian revenues consisted of, 1. Contributions from the allies, which amounted to 600 talents in the time of Alcibiades; 2. Customs at the rate of two per cent. on imports and exports, which yielded about thirty-six talents; 3. Confiscations of the property of individuals; 4. Rents and produce of mines and marble quarries; 5. Capitation tax on the Μετοικοι, or strangers permanently resident in the city. Xenophon estimates the whole at 1000 talents, or L.250,000. (Walpole's *Memoirs relating to Turkey*, p. 435.)

[2] Beaujour, let. 1; Holland, p. 113, 251, 280; Hobhouse, p. 176, 201, 487; Pouqueville, chap. x.

[3] This conclusion is not without its difficulties. But if it involves any errors, they are errors of defect, and not of excess; for any different construction of the text of Athenæus would give a larger number. (See Hume's *Essay on the Populousness of Ancient Nations.*) We may adopt another mode of calculation. The Spartans were the only power who regularly employed their slaves (helots) in their armies, and whose military force may therefore be taken as a criterion of their whole population. They sent, of Lacedæmonians and helots together, 50,000 to fight the Persians at Platæa. The men were collected and sent off within the space of a day or two, and as the Messenians were shortly after in a state of revolt, it may be presumed that none of that nation were in the army. (Herodotus, lib. ix.) If we suppose that this army contained one half of the males of a military age (and probably no country ever sent a larger proportion beyond its own confines), the whole population of Laconia would be 400,000; and that of Peloponnesus, in the same ratio, would be 2,000,000. Supposing the parts beyond the isthmus to be peopled only to three fifths of the density of Peloponnesus, the whole population of Greece would be 8,300,000, an amount not materially different from the other. After all, it must be confessed that so general a conclusion, built on so narrow a basis, is scarcely better than a confession of total ignorance. It may be observed, that the greatest army which England ever sent beyond her own frontier, previous to the present times, was that with which Edward II. invaded Scotland, consisting of 100,000 men.

[4] Geographie der Griechen und Roemer, achter Thiel, p. 294.

We have stated that a small proportion of the inhabitants of Greece live scattered through the country. Were this circumstance not attended to, the number of large towns mentioned by travellers would lead us to conclude that the country is more populous than it really is. We subjoin the names of some of the most considerable towns, with the estimated population :

ALBANIA.

Yanina	35,000	Hobhouse.
Argyro Castro	20,000	do.
Berat	15,000	Holland.
Scutari	12,000	Hobhouse.

MACEDONIA.

Salonica	70,000 60,000	Holland. Beaujour.
Seres	30,000	do.

THESSALY.

Larissa	20,000	do.
Vodina	12,000	do.
Trikala	11,000	Holland.

ATTICA AND BŒOTIA.

Athens	15,000 12,000	Clarke. Hobhouse.
Livadia[1]	10,000	Holland.

MOREA.

Patras	10,000	Holland.
Argos	8,000	do.
Tripolizza	15,000	do.
Misitra	16,000	Pouqueville.
Hydra (Island)	25,000	Holland.

The towns of Greece contrast strikingly with those of Western Europe in their general appearance. Founded rather as places of security, than with a view to commercial advantage, their sites are generally elevated and picturesque. Instead of the long and uniform lines of buildings seen in our cities, the houses often stand detached, and appear irregularly scattered over the ground. The tall, airy minarets also, which break the outline in an agreeable and fanciful manner, and the groups of cypresses surrounding the mosques, which are seen blended with the buildings, give them a character of repose and softness, combined with richness, and even magnificence, which has a fine effect in the landscape. On a near inspection, however, their beauty vanishes. The mean buildings, the streets narrow and dark, seldom paved, and covered with offal and filth of every kind, grievously offend both the senses of sight and smell. The houses of the poorer classes are miserable hovels, built of mud and straw ; those of the peasants in the country are often formed, like the huts of savages, of wooden poles rudely put together in the shape of a tent, and covered with turf. The houses of the better classes in towns are of wood, sometimes with a foundation of stone. They are pretty generally of two storeys ; the upper storey sometimes projecting beyond the lower, in the manner of the old wooden buildings in Edinburgh, and the roof again extending far beyond the face of the upper wall, apparently for the purpose of giving shade and shelter to the streets below. The style of building is extremely uniform. The larger houses are built round a square area ; the under storey, used as stables and warehouses, has seldom any windows on the side towards the street, or it is shut in on that side by a wall, so as to give the house the appearance of a jail. The upper storey presents in front an open gallery, with small windows, latticed with cross bars of wood, and serves chiefly to communicate with the apartments behind. The furniture consists of a very few articles, of a rich, or rather gaudy description : a divan or raised seat, from ten to fifteen inches in height, stuffed and covered with silk, and cushioned behind for the back, extends round three sides of the room. A handsome carpet covers the rest of the floor. These, with a table of very plain construction, and two or three large mirrors in the corners, are generally all that a well-furnished Turkish room contains. The walls are sometimes wainscotted, and adorned with landscapes, or purely ornamental paintings. The roofs exhibit gilding and carved work. Many of the houses of the rich have gardens attached to them, inclosing fountains. The dwellings of the wealthy Greeks are in no respect different from those of the Turks. There is a total absence, in the Greek towns, of that noise, bustle, and activity which give such an animated character to our cities. There are no wheel-carriages of any kind seen, but loaded camels or horses are passing to and fro, through the dust or mud. Hawks and storks are flying about the trees, mosques, and houses ; and great numbers of gaunt and half-wild dogs, which have no owners, are prowling about, picking up the offal thrown into the streets. One of the most interesting objects in a Greek town is always the bazar or market. This consists of one, two, or more streets, filled entirely with shops or wooden booths. The dealers in the same class of articles are all ranged together. One street is occupied by those who deal in jewellery ; another by those who deal in pelisses and shawls ; a third by the retailers of common cotton goods ; a fourth by the dealers in groceries, tobacco, &c. ; a fifth by those who sell pipes, amber, mouth-pieces, &c. ; and so on. These bazars are often shaded by wooden trelisses interlaced with vines, or by branches of trees laid across from the roofs of the opposite shops or booths.

Different races.

The population of Greece is composed chiefly of three different races, not more distinct in their origin than in their manners and character. These are the Turks, the Greeks, and the Albanians, with whom are intermixed a smaller number of Jews, Armenians, and Wallachians. It is extremely difficult to estimate, with any accuracy, in what proportions these different races are combined. The scanty information given by travellers on this subject is often rendered ambiguous by the indiscriminate application of the name of Greeks to persons attached to the Greek church, whether they are of that nation or Albanians. Except in some towns and very limited districts, the Turks nowhere appear to constitute the majority of the population. They are most numerous in Thessaly, Macedonia, and Negropont, are thinly diffused through the rest of Greece and Albania, and are scarcely seen at all in the islands. In the districts of Salonica and Larissa, where they most abound, they scarcely exceed, according to Beaujour, one third of the inhabitants (180,000 out of 500,000) ; in Athens, according to Dr Holland, they amounted to one fifth before the revolution ; in the Morea, they formed one twenty-eighth part by Pouqueville's enumeration ; in Livadia, there were few of them ; in Acarnania and Ætolia, still fewer. In Yanina, they are less numerous than the Greeks ; and throughout Greece generally, except in Thessaly and Macedonia, there were very few Turks among the rural population. Since the revolution, the Turkish inhabitants have almost disappeared from the country south of Mount Œta. If there are any exceptions, they must be trifling. Without pretending to accuracy on a point where accuracy is unat-

Turks.

---

[1] The population of Livadia is computed from the number of houses, reckoning five persons to a house.

tainable, we may perhaps estimate the Turks on these grounds at one fourth of the inhabitants in Thessaly and Macedonia, and at one tenth in the other parts of Greece and Albania, on an average. The whole number of Turks computed on this principle would be 450,000, which is between one fifth and one sixth of the entire population.[1]

Albanians and Greeks.

It is more difficult to form any satisfactory conclusions as to the respective numbers of the Greeks and Albanians. Colonies or parties of the latter people have, from time to time, settled in various districts of Greece. Nearly all of these belong to the Greek church; and they have, with very few exceptions, preserved their native manners, dress, and language, though many of them are also able to express themselves in Greek. Colonel Gordon informs us that Attica, Bœotia, Phocis, Argolis, with the isles of Hydra, Spezzia, Salamis, and Andros, are inhabited by Albanians. They have also several villages in Arcadia, Achaia, and Messenia. In the rest of the Peloponnesus, in all the other islands, in Ætolia, Acarnania, a great part of Thessaly, and Lower Macedonia, the population is exclusively Greek.[2] Mr Urquhart gives an estimate of the different races inhabiting European Turkey, which we subjoin, though his rash and precipitate mode of judging divests it of any high claims to authority.[3]

Osmanlis, Turkish race and language, all Mussulmen	700,000
Greeks, Hellenic race and language, all Christians	2,050,000
Albanians, Skipetar race and language, two thirds Mussulmen	1,600,000
Sclavonic race and dialects (Bosniacs, Tulemans, Servians, Bulgarians, Mirdites, and Croats), one third Mussulmen, two thirds Christians	6,000,000
Vlachi, or Wallachians, Greek church	600,000
Gypsies 200,000, Jews 250,000, Armenians 100,000, Franks 50,000	600,000
	11,550,000
Wallachia and Moldavia	1,500,000
	13,050,000

We are satisfied that the entire population of European Turkey does not exceed nine or ten millions; and in the above table the proportional number of the Sclavonic race seems to be much exaggerated.

Wallachians.

The Vlaki, or Wallachians, are next in numbers to the Greeks, Albanians, and Turks. Like the Albanians, they first appear in the history of Greece about the eleventh century. They are a tribe of mountaineers, chiefly employed as shepherds, living permanently on the great ridges of Pindus and Olympus, and their branches; but, like the Albanians, descending into the plains of Thessaly, Macedonia, and Southern Greece, during the winter, with their flocks. They have a language of their own, which, from the great proportion of Latin words it contains, has led to a belief that they are the descendants of the Roman colonies planted in Mœsia and Dacia by the emperor Trajan and his successors. The rugged country they inhabit has kept them unmixed with other tribes, and enabled them to maintain a considerable degree of independence. They are hardy, but less ferocious than the Albanians, sober, industrious, cleanly, and in high repute as shepherds throughout Greece, both for their fidelity and skill. Some of the higher classes go abroad as merchants; and the lower classes furnish some of the best artisans in Greece and Turkey at large; but wherever their occupations carry them, a strong national spirit recals them ultimately to their native mountains. Within their own country they have considerable manufactures of coarse woollens. They are of the Greek church, and the men generally speak Romaic, or modern Greek, besides their own language; but the women know only the latter.[4]

Bulgarians.

The mountainous districts in the north of Macedonia are inhabited by Bulgarians, who occupy the whole region, from these parts to the Danube, and the neighbourhood of Constantinople. They are a people of Sclavonic origin, profess the Christian religion, and have a language distinct from that of the other people settled in Greece. They live chiefly by their flocks, are rude and ignorant, but brave. They possess only a small portion of the country at present; but for a considerable period between the eighth and eleventh centuries, they were masters of nearly the whole of Greece, and have left traces of their establishment there in the language, and in the names of places.[5]

Jews.

Small bodies of Jews are found in most of the considerable trading towns of Greece, engaged as usual in the lower branches of commerce. There are none in Athens, and this fact is accounted for, as in some other places, by the supposition that the native Athenians outdo them in their favourite profession of usury. There is a considerable number in Yanina; but they are nowhere so numerous as in Salonica, where they have been settled for some centuries. Their number in this city is estimated at 12,000; the peculiar privileges they enjoy, however, have not raised their character; for they are proverbially distinguished throughout Greece for chicanery, dishonesty, and immorality. Considered as a branch of the general population of the country, they are too inconsiderable to be of the least importance. Armenians are also found in some of the towns, but in a still smaller proportion than the Jews.[6]

Gipsies.

Bands of Tchinganies, Zinganees, or gipsies, distinguished by the habits and occupations peculiar to them in other countries, wander over Greece. They are subjected, however, to the capitation tax. Some of them make a profession of Mahommedanism, but they are held in great contempt by the Turks. Some of the more wealthy Turks keep negro slaves, who are imported from Barbary and Egypt.[7]

Greek church.

The Greek church appears at the present day covered with the accumulated abuses of ten or twelve centuries. It was founded in an age of theological casuistry and dogmatism; it has never felt the benign influence of general knowledge, or the salutary control of rival sects; but the bigotry or crooked policy of Christian princes, the barbarism of Mahommedan conquerors, the pious frauds of monks or fanatical priests, the credulity and superstition of an ignorant populace operating uncontrolled, have been continually loading it with new errors, new absurdities, and new corruptions. Though its priests are more numerous than in any other church, its rites and forms infinitely complicated, and its fasts absorb about two thirds of the year, it is scarcely possible to trace one genuine idea of Christianity in the minds either of the clergy or laity, or one trait of its influence in their conduct. The subtlety of understanding by which the Greeks are distinguished, and still more their proneness to superstition, have made them hold fast by their national faith amidst all the calamities they have suffered. And their barba-e.

sm has never yet been carried so far as to reduce the
umbrous machinery of their religion to any degree of
mplicity.

nes
es.

The Greek church agrees so closely with the Roman in
s doctrines, and even in its forms, that it is rather diffi-
ult to discriminate them by any intelligible distinctions.
he Greek church holds the doctrine of the Trinity, with
ome unimportant peculiarities. In the number of its sa-
raments, the invocation of saints, the belief of the real
resence, the practice of auricular confession, and in ad-
itting masses and services for the dead, it agrees per-
ctly with that of Rome. The sacrament of the Lord's
upper is administered to infants newly born, and, in the
lace of confirmation, they substitute the chrism or sacred
nction, being a part or appendage of the baptismal cere-
ony. The sacrament of the Holy Oil, or Euchelaïon, is not
onfined, like the extreme unction of the Roman Catholic
hurch, to the sick and dying, but is given to devout per-
ons upon the slightest malady, or even in perfect health.
n Holy Thursday the Greek archbishop, like the pope,
ashes the feet of twelve priests or monks. It is rather
oubtful whether the Greek church admits a purgatory,
least in the same sense as the Roman Catholics; and
ey themselves, at the present day, are too ignorant to
e able to tell. The most palpable distinction between
e two churches, in the eyes of the common people, is,
at the Greeks abhor the images used by the Catholics,
d employ only paintings in their churches. They have
ur liturgies; and the service, which consists chiefly of
rayers, hymns, recitative chants, and frequent crossings,
ithout any sermon, often occupies five or six hours. The
ant of seats in their churches, during the long service,
supplied by staves or crutches, which are used for lean-
g on, and form part of the church furniture. Their mu-
c is without instrumental accompaniments, but is allow-
d to have considerable beauty. The floor of the church
generally of earth, the altar of stone, the sanctuary se-
arated from the nave by deal boards, and an enclosure of
ales set off at the other end for the women. The church
generally in the form of a Greek cross. The choir is
ways placed towards the east, and the people turn their
ces in that direction when they pray. The books of
ffices include biographies of saints, and are numerous and
ulky. The clergy are distinguished by a great variety
striking vestments, to which many mystical virtues are
scribed. The Panagia, or Holy Virgin, has succeeded
the worship formerly paid to Minerva. There is scarce-
a cottage in which her picture, with a lamp burning
efore it, is not seen in a wooden case or a niche of the
all. The secular Greeks have four Lents, which are ob-
erved with various degrees of strictness; and the caloy-
s, or monks, have two more. The first of the secular
sts lasts two months, the second forty days, the third,
hich depends on moveable feasts, varies in its length,
e fourth endures from the 1st of August to the festival
the Assumption. Every Wednesday is a fast, because
was on that day Judas received the money for betray-
g Christ; and every Friday in remembrance of the cru-
fixion. A vast number of saints' days are also observed,
that of the whole year there are only about a hundred
d thirty days free of fasts or festivals. During these
sts the women are employed in gathering snails, and
arching for herbs of different kinds. The change of
od is enforced, without exception, on infants, old peo-
le, and the sick. Some of the festivals are celebrated in
e open air during several days, with the firing of guns,
ngs, dancing, banqueting, and the most extravagant re-
lry. As confession generally takes place on these occa-
ons, as a preparation, they are a harvest to the papades,
ho make a charge for absolution proportioned to the mag-
itude of the sin, and the supposed wealth of the sinner.

Greece.

Monks.

The Greek clergy are of two classes, the caloyers or monks, and the papas or priests. Monasteries, which are very numerous throughout Greece, are generally built in rocky and inaccessible situations for the sake of defence. They are supported partly by farms cultivated by lay brothers, partly by donations and perquisites received from the pious, partly by the exercise of mechanical trades, and the fabrication and sale of crosses, pictures of saints, psalters, &c. Their cells and prisons are universally dirty, as their minds are overrun with ignorance and superstition. In the vast establishment of Mount Athos, however, where before the revolution five or six thousand monks were assembled, and in the monastery of the Apocalypse, in Patmos, there are seminaries where some slight theological studies are pursued. The Patriarch of Constantinople, and all the superior Greek clergy, are generally taken from these places. Novices are admitted into monasteries as early as ten or twelve years of age. The noviciate lasts two years, in the most regular monasteries; after which the novice changes his habit, and becomes one of the professed. The monks who distinguish themselves by superior sanctity may be advanced to a still higher class, called Megaloschemoi, who are thought worthy of being compared to angels. Their general diet is fish, pulse, roots, olives, and wine; during their fasts, which occupy nearly the whole year, pulse, roots, and water only. But, notwithstanding this mortified style of living, they are the sleekest and best fed people among the Greeks. Convents for women are rare. There are some anchorets, who live three or four together, in houses depending on convents; and a few ascetics, who live solitarily in caves in the mountains. Convents of all kinds are under the superintendence of the bishop of the diocese. The expectations, long indulged, of finding some of the lost classics in the libraries of these establishments, have been at last entirely dissipated. Professor Carlyle examined the libraries of the whole twenty-two monasteries on Mount Athos, containing altogether 13,000 manuscripts, a greater number, certainly, than exists in all the other monasteries in Greece, and found not a single unedited fragment of any classical author. (Walpole, p. 196, 220).

Secular clergy.

The officiating clergy consist of two classes, the patriarch, archbishops, and bishops, and papades or parish priests. All those of the first class are taken from the monasteries, and are not allowed to marry. The papades are allowed to marry once only previous to their consecration, but not afterwards. Hence, before entering into orders, they are generally careful to choose healthy partners, who are likely to live many years. The superior clergy have some little learning, are generally decent in their characters, and attentive to the duties of their stations, which are numerous and difficult; as, besides having to control the licentious and fanatical priests, they are umpires in all disputes among those of their communion, and exercise an extensive civil authority under the Turks. They enjoy the title of δεσποτης, or lord, and are treated with extraordinary reverence. They are, in fact, the princes of the Greeks at the present day; and hence the first families send their children to the monasteries of Athos or Patmos, on purpose to qualify them for these dignities. The Turks having reserved to themselves the investiture of the prelates, openly put the offices to sale, and hence the most indecent broils arise among the candidates. The Patriarch of Constantinople, who ruled the whole Greek church in European Turkey, and nominated all its inferior dignitaries, was said to pay sixty thousand crowns for his office. His income does not exceed L.3000 per annum; and that of bishops in general L.300. Dr Holland, however, was informed that the Archbishop of Larissa had a revenue of L.9000, but he doubts whether the amount was not exaggerated. The patriarch draws his revenue from contributions upon the archbishops and bishops, who are supported by a tax on each house within the dioceses inhabited by Greeks.

The inferior clergy are appointed papas, or parish priests, by a species of parochial election; and before arriving at this office, they pass successively through the subordinate stations of reader, chanter, subdeacon, and deacon. No farther promotion, however, awaits them. Their means of living depend as much on their knavery as on their diligence in pastoral duty. They are supported chiefly by perquisites derived from absolutions, benedictions, exorcisms, sanctifying water, administering sacraments, selling amulets, sprinkling the streets and tombs, blessing the sea, granting divorces, for most of which a certain price is fixed. The profits of excommunications, which are large in proportion to the terror they inspire among all classes, belong to the superior clergy, who alone have the power to issue them. By a shocking abuse of religious functions, the priests, when well paid, grant divorces at the instance of one party on the slightest pretence, and break the most sacred ties for a paltry bribe. Nearly all authors who have alluded to the Greek priests agree in describing them as the most depraved part of the population. They are coarse in their manners and dirty in their persons, ignorant, greedy, and corrupt, and instead of cherishing virtuous habits in the people, they enervate and debase them, by practising on their credulity, and filling their minds with wretched superstitions, and perverted ideas of duty. It is not uncommon for them to lay aside the sacerdotal character, and become menial servants or public dancers, or to join bands of pirates or robbers. They are besides excessively numerous; and the people, who are extremely credulous and superstitious, are entirely under their influence. Athens, with 7000 or 8000 Christian inhabitants, had formerly 200 churches, of which about fifty were used every Sunday, and the rest occasionally. (Wheler, p. 350.) In Albania the priests are much less numerous, and much less respected. In a word, the swarm of worthless priests is the moral pest of the country, and contributes more, perhaps, to keep the people in a state of ignorance and degradation than all the other evils in their condition.[1]

Antiquities.

The antiquities of Greece open so wide a field, that, in an article of this kind, we can do nothing more than allude to the various classes of objects comprised under the title. Among these we may, without much impropriety, rank many of the cities themselves, which not only exist on the very spots they anciently occupied, and bear the same names, but, deriving their most striking characters from natural objects, which remain unchanged, they still present to the eye, at a distance, the same general aspect and outlines. With regard to the interior of the cities, also, though the august temples of the gods have disappeared, and filth and meanness meet the eye everywhere, little doubt will remain with those who have read what the ancients have left us on the subject of their private houses, and what modern travellers have told us respecting the disinterred buildings of Pompeii, that the houses at the present day, with their square enclosed courts, their projecting roofs, and dead walls, and all that is most peculiar in their plan and interior arrangements, are copies, though miserable copies, of those of the ancient Greeks; and it is probable that some of the modern dark and narrow streets of Athens come much nearer in appearance to what they were in the age of Pericles than the admirers of antiquity are willing to allow. Among the cities which occupy their ancient sites, and bear their ancient names with little alteration, may be mentioned, Athens, Thebes, Livadia, Larissa, Pharsalia, Salonica, Corinth, Argos, Nauplia, Patræ; and a great number of others of less note, might be added. The ancient buildings of which remains now exist belong to three different eras: 1. The very ancient structures to which the name of Cyclopian has been given, consisting of vast masses of unhewn stone, put together without cement. They are not numerous. The ruins of the citadels of Tyrins and Mycenæ, which are of this description, have remained in their present state for 3000 years, and present the most perfect specimen in existence of the military architecture of the heroic ages.[2] 2. The works of the classical ages, consisting of temples, baths, porticoes, theatres, columns, stadia, fountains, which are extremely numerous, and executed in a great variety of styles, exemplifying the infancy, progress, perfection, and decline of the arts. Of the two or three hundred temples enumerated by Pausanias, many of which were models of the most exquisite beauty and symmetry, that of Theseus at Athens was the only one tolerably entire; and it was destroyed by the Turks in 1827. Others are found in various stages of dilapidation; and the far greater part have vanished from their sites, and only left traces of their existence in their innumerable fragments of inscribed and sculptured marbles scattered over the fields, or stuck into the walls of forts, churches, and clay-built cottages. 3. A number of square towers, of a rude construction, built on the tops of hills, for military purposes, are the only memorials left by the Latin princes who ruled Greece for two or three centuries before the Mahommedan conquest. 4. Next in importance to the remains of ancient edifices we may rank the statues, bas-reliefs, and inscribed marbles; a great number of which, generally somewhat mutilated, have been brought from Greece to enrich the museums of Western Europe; and a much greater number, no doubt, lie buried under the soil. 5. Vessels of terra cotta, or ancient pottery, consisting of vases, amphoræ, lamps, &c. of exquisite workmanship, adorned with coloured designs illustrative of the arts, habits, and mythology of the ancients, and often in high preservation. The quantity of these found among the ruins of ancient cities is incredibly great. 6. Coins of gold, silver, and copper, which are great in number and variety, every considerable town having its separate coinage. 7. Amongst the most interesting remains are the tumuli, erected to commemorate great victories. These simple but expressive monuments, formed of conical mounds of earth, but long since divested of their sculptured ornaments, still mark the fields of Marathon, Leuctra, Platæa, Cheronæa, Thermopylæ, Pharsalia, and Pydna. 8. We ought also to class among the antiquities of Greece a vast number of fountains, caves, rocks, and other natural objects, which owe their interest, not to any beauty or importance they possess in themselves, but to the legends associated with them in the history and mythology of the ancient Greeks. With regard to the antiquities of Greece in general, it may be observed, that the finest, the best preserved, and the most numerous specimens of ancient art are found at Athens. Salonica, it is said, ranks next to it in this respect: but its monuments are deficient in the interest derived from classical associations. In general the southern and eastern parts of Greece, and the islands, abound most in antiquities. Albania and Ætolia contain but few, and these not of much interest.[3]

[1] Tournefort, let. 3; *Constantinople, Ancient and Modern*, by James Dallaway, sect. xxiv.; Pouqueville, chap. xii.; Hobhouse, let. 32.

[2] In Sir William Gell's *Itinerary of Argolis*, a good account of these remarkable ruins is given, illustrated by excellent drawings.

[3] On the subject of the Antiquities of Greece, the reader may consult the following works: *Les Ruines des plus beaux Monumens de la Grèce*, par M. Le Roy, fol. 1758; *The Antiquities of Athens*, by Stuart and Revett, 4 vols. fol. 1762–1816; *The Ionian Antiquities*,

There are five languages spoken in Greece at the present day: 1. The Turkish, which is in use among a few of the Turks, but the great majority speak Romaic. 2. The Bulgarian, a dialect of Sclavonic, spoken by the tribes of Bulgarians who inhabit the northern parts of Macedonia. 3. The Wallachian, in use amongst the Vlaki, who occupy the branches of Pindus and Olympus; a language of uncertain root, but containing a large mixture of Latin, and some Italian. 4. The Albanian or Skipetaric, spoken by the natives of Albania, and by some of the colonies of this people in the south of Greece. It is an unwritten tongue, and abounds in nasal sounds. Its basis is supposed to be the ancient Illyrian, with which is intermixed a large proportion of Latin, and smaller proportions of Romaic, Sclavonic, Italian, and Turkish. 5. The Romaic (*Ρωμαικη*) or modern Greek, spoken by all the Greeks, by most of the Turks, and by a part of the Albanians. This is the name given to the language by the Greeks, who call themselves *Ρωμαιοι*, or Romans, a denomination derived from the establishment of the Roman empire for so many ages at Constantinople, which they consider as the capital of Greece. The Romaic bears a much closer resemblance to the Hellenic than the Italian to the Latin. Indeed we have been informed by one of the best modern Greek scholars in Europe, that if we take the Attic as a standard, the ancient Doric differs as much from it as the present living dialect. The peculiarities which distinguish the Romaic from the ancient Greek cannot be fully explained without many details; we shall, therefore, only notice some of the most prominent. These are, 1. The disuse of the aspirates in speaking, though they are retained in writing. 2. The adoption of the first numeral *ενας μια ενα*, for an indefinite article, as in the French. 3. In substantives it discards the dual number, and the dative case; makes some alterations in the oblique cases; marks cases sometimes by prepositions; and often changes the Hellenic masculine and feminine into neuter. 4. The degrees of comparison are formed as of old, by adding -*τερος* and -*τατος*, but sometimes by *πλεον*, *plus*, as in the French. 5. Diminutives are much used, as in the Italian. 6. Considerable changes and substitutions have been made in the tenses of the verbs; the infinitive and the middle voice have been suppressed, and two auxiliary verbs introduced, *θελω*, *I will*, and *εχω*, *I have*. 7. The Hellenic pronouns are retained, but with many modifications. 8. Some new words have been adopted from the Turkish, Latin, and Italian; others have been formed from Hellenic roots; and many old Hellenic words have changed their meaning, attributives being used as substantives, and *vice versa*. The pronunciation of the Romaic deviates widely from that of the ancient Greek as taught in our schools. The Β is sounded like our V, whilst the place of Β is supplied by *μπ*. The Δ is sounded like *th* in *that*, and *θ* like our *th* in *think*. The vowels *η*, *ι*, *υ*, and the diphthongs *ει*, *οι*, *υι*, are all pronounced like the Italian *i*. Great liberties are also taken with the orthography of the Romaic. Vowels are substituted for one another, and letters or syllables suppressed or added, according to the fancy of the writer, at the beginning or end of words. In addition to all this, there is a perplexing diversity in the style and construction. Those who write in Romaic, having no good models before them, readily fall into provincial vulgarisms; and as they often derive their ideas of composition from works in Hellenic, Italian, or French, they adopt, to a greater or less extent, the idioms of these languages. It is said, however, that the dialects of the spoken Romaic in Greece have not so marked a difference as those of the distant provinces of France or England. The purest dialects, or those which approach nearest to the Hellenic, are found in some of the least frequented islands of the Archipelago, in the mountainous parts of Greece, at Yanina, and among the well-educated Greeks of Constantinople. The Romaic of Athens is full of corruptions derived from the Italian and French; and the Athenians of modern times, though still distinguished for quickness and subtlety of understanding, are reproached by their countrymen with an indifference or want of capacity for literary pursuits. A great number of books, chiefly translations, have been printed in Romaic within the last fifty years; and even previously to the revolution there was not a Greek community, in a moderate state of opulence, which did not support a school for instructing their children in the ancient Greek, and often in other branches of polite education.[1] Since tranquillity was restored, the cultivation of the modern tongue has not been overlooked; and the object of their best scholars now is to bring it back as near to the standard of the ancient as may be practicable. The name of Romaic is going into disuse; the modern language being denominated *Greek*, and the ancient, for the sake of distinction, *Hellenic*.

Physiognomy, &c.

There is a national likeness observable in all the Greeks, though, upon the whole, the islanders are darker and of a stronger make than those on the mainland. They have a larger facial angle than the other nations in the south of Europe, to whom they are manifestly superior both in countenance and form. Their faces are just such as served for models to the ancient sculptors, and their young men, in particular, are of that perfect beauty, which we should perhaps consider as too soft and effeminate in those of the same age in our northern climate. Their eyes are large and dark, their eye-brows arched; their complexions are rather brown, but quite clear; and their cheeks and lips are tinged with a bright vermilion. The oval of their faces is regular, and all their features in perfect proportion. Their hair, which is dark and long, is shaven off on the fore part of the crown and side of the face, and they wear a thin long mustachio on the upper lip. Beards are worn by the clergy, the codjia-bashees, and other men in authority. Their necks are long, but broad and firmly set, their chests wide and expanded, and their waists rather slender. Their legs are strong and well made; their stature above the middling size; and they are muscular, but not brawny, nor inclined to corpulency. Both the face and form of the women are very inferior to those of the men. Though they have the same kind of features, their eyes are too languid, and their complexions too pale, and, even from the age of twelve, they have a flaccidity and looseness of person which is far from agreeable. They are generally rather below the middle size, and when between twenty-five and thirty, are commonly rather fat and unwieldy.

Dress.

The dress of Greeks of the wealthier classes closely resembles that of the Turks. A cotton shirt made like a woman's chemise, cotton drawers, a vest and jacket of silk or stuff, a pair of large loose trousers drawn up a little above the ankle, and a short sock, make the inner part of their dress. Next above this is a long shawl wrapped in wide folds round the loins; and a large gown or pelisse, with loose sleeves, forms the outer garment. The head is covered with a calpac instead of a turban. They wear slippers or quarter boots, which the privileged

[1] Leake's *Researches*, chap. i. The works published in Romaic have been chiefly printed at Vienna and Venice; a few at Moscow, Buda, Paris, and other towns. See a list of these works in Hobhouse's *Travels*, chap. xxxiii. and Leake's *Researches*, p. 77.

Greeks may have of a yellow colour, but even they are not permitted to wear robes of green, the favourite colour of Mahommed. The common people have their trousers descending but a little below the knee, with bare legs, and a slipper pointed and turned up at the toe. Above this they have a jacket, and on their heads the little red Albanian scull-cap.

The dress of the females approaches much nearer to that of the Frank ladies, and need not here be particularly described. That of the richer females is profusely ornamented with gold and silver trimmings. They wear bracelets of precious stones, and strings of gold coins round their arms and necks. They colour the inside of the eye-lashes with a composition, and use washes and paints to improve their complexion. With the young women it is a prevailing fashion to dye the hair of an auburn colour. When abroad, the Greek ladies are muffled up in a wrapping cloak, and wear a long veil, which, however, they frequently throw aside when not in the presence of the Turks. They live almost as much secluded as the Turkish ladies. Indeed before marriage they are rarely seen by any male, except of their own family; and even the lover rarely sees his mistress till she become his bride. But afterwards the ladies enjoy the privilege of being introduced to people of their own nation, and to travellers. When in the interior apartments, a young woman divests herself of her outer robes; and, in the summer season, may sometimes be surprised reclined on a rich carpet or sofa, with her feet bare, and her whole form rather shaded than concealed by trousers of gauze, and a muslin cymar.

Women.

The women can seldom read or write, but are all of them able to embroider very tastefully; and they can generally play on the Greek lute or rebeck. Their dancing they learn without a master, from their companions; and their favourite national dance, the Romaika, is thought to bear a striking resemblance to the ancient Cretan dance, invented in the time of Theseus. Most of them are acquainted with a great number of songs or recitatives, accompanied with tales, which are combined and taken up by different individuals in succession for hours together. The Greek women evince a great quickness of understanding, and much aptitude for the acquisition of languages and other branches of education, when an opportunity offers. But their early marriages (for they are sometimes married at thirteen or fourteen) are prejudicial to their mental improvement. They are, however, assiduous housewives and tender mothers, and, notwithstanding the scandalous imputations of some travellers, generally chaste. The state of bondage and seclusion in which they are kept naturally enfeebles their characters, and they are excessively credulous, weak, and superstitious, slaves to a thousand vain apprehensions, believing in sorcery and witchcraft, and receiving implicitly the dogmas and fables of their church. They are much guided by ominous dreams and celestial revelations; and at births, marriages, and other memorable domestic events, they have recourse to many spells and superstitious rites, to guard against fairies or wicked spirits. The evil eye is particularly dreaded; and the herb garlic is in high repute as a charm against this and other imaginary misfortunes. At funerals, women hired for the purpose accompany the bier, howling in a manner rather ludicrous than mournful, proclaiming the virtues of the deceased, and calling aloud to the corpse, "Why did you die? You had money, you had friends, you had a fair wife and children; why did you die?" On the ninth day after the funeral, the nearest relation gives a feast, with music, dancing, and every other sort of merriment. Many of the rites and ceremonies now in use, and not a few of the observances connected with religion, have evidently been transmitted unaltered from pagan antiquity. (Hobhouse, let. 31.)

The Greeks affect a great deal of parade in their style of living. Those who are in office are addressed by pompous titles, keep great numbers of servants, dignified with the names of secretaries, physicians, couriers, &c. and have large houses, which are in general shabbily furnished, and very dirty. Both Greeks and Turks contrive to support a respectable appearance by very slender means. The Greeks, like the Turks also, are all smokers, and addicted to the use of the hot bath. The men generally bathe once a week, the women at least once a month. Their diet, when not restricted by their fasts, consists, amongst the poorer classes, of bread made of barley, wheat, or Indian corn, pilau, or boiled rice mixed with butter, eggs, sheep's milk curdled, cheese made of sheep or goat's milk, dried fish, olives, gourds, melons, and various other vegetables. On holydays, lamb, mutton, kids' flesh, or fowls, are served up. The rich have a greater variety in their dishes and cookery. The mutton, which is the kind of animal food most in use, is seldom good, and is generally roasted or stewed, rarely boiled. Pastry is common, but is very indigestible, being sweetened with honey, and not well baked. Boutaraga, caviar, and macaroni, are generally met with on the table, and a dish of snails is not uncommon. The bread is coarse and under baked. Salted olives are a standing dish, and gourds and melons in their season. Great quantities of vegetables are consumed, such as cabbages, cauliflowers, spinach, artichokes, &c. which are generally prepared with oil or butter, and seasoned with pepper, mint, marjoram. Oranges, pears, olives, citrons, medlars, pomegranates, are served up as a dessert. During dinner the Greeks drink wine, and a spirit made from barley, resembling whisky; but they rarely indulge to excess. Coffee is much in use, but is taken rather as a refreshment than as a part of diet. In general, says Dr Holland, the Greeks have an appearance of comfort in their dwellings, clothing, and in the various habits of life, not much inferior to that of other nations in the south of Europe.[1]

Travellers seem now to be nearly agreed as to the intellectual and moral qualities of the Greeks. It is allowed that they have much acuteness of understanding, polished and agreeable manners, a sprightly wit, and great natural eloquence; but, on the other hand, their apologists cannot deny that, though strict in their fasts, they are lax in their morals; that their vanity forms a lamentable contrast with their humbled condition; and that they have more than an ordinary share of duplicity, meanness, and bigotry.

A great proportion of the Greeks are engaged in foreign or domestic trade; and as merchants they are reported to be vigilant and dexterous, but overreaching and deceitful. Those who get into power, as archons or codjia-bashees, are as rapacious and tyrannical as the Turks. All classes are devoutly attached to the doctrines of the church, and hold other sects in such contempt that they regard themselves and the Russians as the only Christians. The few well-informed men among them are generally sceptical, as will always happen where religion is debased by absurdities which shock the understanding. One of the best features in their character is the strong national spirit which animates them, and the lively interest they take in the fate of their country. The Greeks settled in Russia and Italy, and some of those at Constantinople, have expended a considerable part of their fortunes in supporting schools, and in printing works designed to enlighten their countrymen; and the sacrifices made during the revolution, by men of all classes, proves that their patriotism is strong and ardent. Though the deeds of the ancient Greeks live n their memories, and are often in their mouths, they have a very confused and erroneous idea of their character. They associate the glory of their ancestors much more with the empire of Constantine and his successors, than with the Greek republics. And their bigotry has so far perverted their ambition, that the overthrow of the Turks would gratify them more as the triumph of their church than as the establishment of their independence. In private life the Greeks have much social feeling; and, though easy in their manners, are strict observers of forms. Two men in saluting first touch their foreheads, then place their right hand on their hearts, and kiss each other. They make the most ceremonious and particular inquiries after each other's families. It is rare to find a Greek living single, except as a widower, for they seldom marry a second time. They are fond of titles and distinctions, in proportion to their want of real strength and dignity of character. Every archon and codjia-bashee, though he has but the shadow of official dignity, is "most illustrious," or "most noble." A bishop is styled "your beatitude," a priest "your holiness." They are avaricious; but they desire money only for the purpose of ostentation. Their veneration for wealth ndeed supersedes, in some measure, the strongest natural ties. Children who get rich sometimes employ their own fathers as menial servants, and are waited upon by them at table. Parents teach their children to kiss their hands, and to address them by the title of signor, which implies superiority, and is therefore preferred to more endearing appellations. All classes, but especially the lower, are ively and gay, excessively fond of dancing, music, and pastimes. They delight in poetry, and have a remarkable facility in versifying. Of popular songs they have a great variety relating to love and drinking; some of them written by living authors who have distinguished themselves n this species of composition. They have also some pieces of a greater length, and of a dramatic form. Their music, which is plaintive but monotonous, is sung with a nasal tone. The fiddle and three-stringed guitar are the instruments most in use. Strolling bards, still bearing the ancient name of rhapsodists, frequent the houses of the wealthy, singing love songs, or celebrating in rude verse the exploits of some warrior, and accompanying their voices with the lyre. Foot races, wrestling, and the disc, are still, as n ancient times, favourite amusements.

---

[1] Hobhouse, 226; Pouqueville, chap. xv.; Holland, 268.

The Greeks of the present day, though unquestionably much debased, are rather objects of compassionate sympathy than indignation. The cardinal vices of their character, dissimulation, meanness, and superstition, are so distinctly referrible to their political situation, as to warrant a belief that a favourable change in the one would speedily be followed by an improvement in the other. Experience tells us that misery and persecution increase men's attachment to their religion; and that, among a people so attached to their religion, possessing lively imaginations, but grossly ignorant, and where the only pittance of knowledge to be found is in the hands of priests, superstition must take root and flourish; and when we recollect that the national faith of the Greeks, rendered venerable in their eyes by its antiquity, has descended through a period of fifteen centuries, exposed to the continual action of all the causes that could corrupt it, without one lucid interval of free inquiry and diffused knowledge, we cannot be surprised that the vital principles of religion have totally disappeared amidst the rubbish of senseless forms, mystical rites, and vain pageantry. Again, with regard to the civil condition of the Greeks, it may be observed, that the slavery in which they are held is of the most demoralizing kind. Uninstructed though they be, they are enlightened compared with the Turks. But knowledge, when doomed to dependence on ignorance and rudeness, unavoidably degenerates into craft and duplicity. Instead of raising the character of the individual, it furnishes him with new powers of servility and deceit, and makes him more deeply conscious of the ignominy of his condition. A human being can never feel his self-degradation so complete as when he is the slave of another whom he despises. What is still worse in the state of the Greeks, the lord and vassal are separated by difference of faith; and the rancour of religious bigotry inflames the contempt and hatred naturally generated between the oppressor and the oppressed. Human nature, in such painful circumstances, has but two resources; resistance at the hazard of extermination, or entire submission. The suffering party must either bend to its hardy destiny, and endeavour, by flattery, duplicity, and management, to molify the violence of the oppressor, and by cunning and dissimulation to elude his tyranny; or it must assume a courage from despair, and extort better terms by the obstinacy of its resistance. The Jews, the most degraded portion of European society, illustrate the one case; the Albanians the other. Though too many of the Greeks chose the less honourable alternative, and sunk to a state of abasement resembling that of the Jews, they have also shown themselves capable of acting the more rugged and difficult part when favoured by circumstances. The inhabitants of the hilly country have everywhere forced the Turks to respect their privileges; and the firm and unconquerable spirit displayed by the Mainotes of the Morea, and the Suliote Greeks, in defence of their rights, is worthy of the most brilliant days of Sparta or Rome.

NARRATIVE OF THE GREEK REVOLUTION.

In the course of last century, the Greeks made two unsuccessful attempts to liberate themselves. The first was in 1770, during a war between Russia and the Porte. The Russians, in pursuance of a plan previously concerted, landed a small force of 2000 men at various points in the Morea. The Mainotes and other Greeks instantaneously rose in arms, and got possession of the open towns, butchering the Turks with every circumstance of cruelty. Before they had mastered any of the fortified places, however, a great force of Albanians pouring in, defeated them, and retaliated, with dreadful severity, the cruelties committed on the Turks. The inhabitants of some entire towns and villages were massacred, and the country was almost desolated. Though the Greeks acted with much vigour at the outset, it was observed that their spirits sank at the first check they received. But it is impossible to reprobate too strongly the cruelty and perfidy of the Russian government, which, by sending such an inadequate force, exposed the Greeks to certain destruction, for the sake of operating a paltry diversion in its own favour; and, at the conclusion of a peace, took no effectual means to protect them from the rage of their enemies.

In 1790, the Greeks of Suli, in Albania, rose in arms, upon an understanding that assistance was to be received from Russia. A deputation went to Petersburg to offer the crown of Greece to Prince Constantine, brother of the present emperor, whom they saluted *βασιλευς των Ἑλληνων*. They were to collect their various troops from Suli, Livadia, Attica, and the Morea; to march through Thessaly and Macedonia, where they were to be joined by other reinforcements; and to meet the Russians at Adrianople with 300,000 men (as they gave out), after which the combined army was to proceed to Constantinople, and drive the Turks out of Europe. But in the end little was done. The Russians sent a trifling sum of money, which was chiefly embezzled by their own agents, and soon made peace, without concerning themselves about the peril into which they had brought the Greeks. The Suliotes defeated the Pasha of Yanina; and, aided by their rocks, defended themselves, performing prodigies of valour against the Albanian Turks. A squadron of twelve small vessels, which they had fitted out at Trieste, signalized itself in the Archipelago, and after spreading terror amongst the Turks, was overpowered and destroyed by a greatly superior force. This second enterprise, in short, ended like the first, without any other effect than that of exposing the Greeks to renewed outrages from the Turks. The brave tribe of the Suliotes, on whom the Greeks placed great reliance, as the best soldiers of their faith, were reduced to a remnant by Ali in 1803, after a contest of many years.

Though the hopes of the Greeks were cast down for a time by this event, various causes were silently operating a change in their situation, and preparing the way for a more successful effort. Amidst all the hardships of their lot, knowledge had been steadily increasing. The influence of Russia over the Porte was visibly extending, and promised them sooner or later the means of exchanging Mahommedan for Christian rulers. But what was of more immediate importance, the establishment of Russian ports on the Black Sea, and the destruction of the French shipping by the wars of the revolution, created a trade in corn between Odessa, Marseilles, Leghorn, and Trieste, which falling into the hands of the Greeks, had raised up a class of capitalists amongst them, and given them possession of a commercial navy. From a few small barks engaged in coasting traffic, a short period saw them in possession of some hundred large well-rigged merchantmen, making long voyages. Greek houses were established at the ports mentioned, as well as at Smyrna, Salonica, and Constantinople. As patriotic feelings were universally diffused, a part of the wealth thus acquired was expended in founding schools and libraries, and the number of Greek youths sent to the universities of Western Europe was greatly increased. The ancient classic writers of the country were studied with new ardour, and lessons of freedom, magnanimity, and patriotic devotion, eagerly imbibed from their pages. Amongst the educated Greeks, those especially who had studied in France, Russia, and Germany, a more just idea was acquired of the relative weakness of the Porte, and the advantages which any people contending with it might derive from those arts and improvements, the growth of an advanced civilization, which the Turks despised. The conviction thus gained strength, that nothing more was necessary to accomplish the liberation of the Greeks, than a combined and organized effort by themselves, aided if possible by the countenance of some great Christian power. This idea gave birth to the *Hetairia*, a secret association, which is supposed to have originated about the beginning of the present century, but remained obscure and feeble till 1815. About that time Count Capo d'Istrias, a Greek by birth, who enjoyed a considerable rank in the Russian service, established a Philomuse Society, ostensibly to promote Greek literature, but really to serve as a cloak for the Hetairia. In a little time he withdrew from its apparent guidance, but without ceasing to promote its objects privately. The Hetairia had a complex and artful organization. It was divided into five orders: those of the first or lowest receiving merely a general intimation that a scheme was in contemplation to regenerate Greece; and the information communicated of the society's designs becoming more special and distinct through the other grades, to the fifth or highest, called the Grand Arch, which was composed of sixteen members, and alone possessed a full knowledge of the society's plans, the power of issuing general orders, and fixing the time and mode of execution. All the members were sworn to secrecy on their knees, at the dead of night, and bound to kill any one of their brother members who should be guilty of treachery. The grand arch had its seat at Moscow, from which it corresponded with persons in all parts of Europe. The society spread its ramifications through the southern parts of Russia, had numerous members in Odessa, Yassy, Bucharest, and in Greece Proper, and some at Vienna, Paris, and Leghorn. Most of the primates of the Morea joined it in 1819. This conspiracy had been spreading its roots through European Turkey for five years before the Ottoman government knew of its existence; and when at length apprised of the fact by an accidental circumstance, its usual apathy, and its contempt of the Greeks, prevented it from taking any precautions to avert the threatened danger. It has been said that the Hetairists had fixed upon the year 1825 for beginning the revolution; but the statement rests on no good authority. Whatever might be their intentions, the rebellion of Ali Pasha, by embarrassing the Porte, and neutralizing one who would have been a formidable enemy, presented an opportunity too favourable to be lost, and precipitated the commencement of hostilities.

In the autumn of 1820 a Turkish army advanced into Albania. Most of Ali's officers and armies having deserted his standard and joined the enemy, he shut himself up in a fortress at Yanina, after destroying the town, and prepared to stand a vigorous siege. Aware of the designs of the Hetairists, he stimulated them to take up arms, by a promise of money and assistance; and though they did not confide in it, they resolved to embrace the advantage which the position of affairs held out. The first movement was in a distant quarter. By previous concert a number of Greeks assembled at Yassy in Moldavia in the end of February 1821, and on the 6th of March Prince Ipsilanti, who held the rank of major-general in the Russian service, crossed the Pruth, and joined them. After proclaiming the independence of Greece, he left that town on the 13th, with eight hundred horsemen, proceeding towards Bucharest, but lost time foolishly on the road, and did not enter the capital of Wallachia till the 9th of April. Dissensions in the mean time broke out in his small army; and though the spirit of the people was good, and the lethargy of the Turks left him a clear space for action, his incapacity and indecision rendered him unable to improve these advantages; and a proclamation issued by the Russian consul, in which the insurrection was strongly condemned by the emperor, on whose assistance they had relied, completely disheartened the insurgents. About the end of April, a body of Turks put themselves in motion from Silistria, occupied Bucharest, and followed the insurgents northward. Some trifling skirmishes took place in the neighbourhood of Tergoivisht, rather to the disadvantage of the Greeks; and a rash and unsuccessful attack made by one of their officers at Piteshti caused a panic in the army, followed by a disastrous retreat. In this action the greater part of the Sacred Battalion, composed of Greek youths from various parts of Europe, was destroyed, after a brave resistance. Ipsilanti shortly afterwards stole away from his troops, and sought refuge within the Austrian boundary. A partisan warfare was continued a little longer. One small corps retreated to Yassy, and thence to Skuleni on the Pruth, where, under Athanasius of Agrapha, they sustained an attack from a body of Turks six times more numerous, refusing to fly, though the means of retreat were open to them, till three fourths of their number were destroyed. Another small party under Yorgaki, or George the Olympian, shut themselves up in the monastery of Secka, where they resisted the Turks for six and thirty hours. At length, when the enemy got into their rear, and success was hopeless, the gallant chief, having refused the safe retreat which the Turks offered him, called his followers together, and exhorted them to seek a glorious death sword in hand.

inding that instead of seconding his heroic resolution, ey were preparing to fly, he retired to the chamber where s powder was deposited, and uttering a short prayer, ew himself up, with four of his attendants. George was native of Mount Olympus, and in his conduct during is short campaign showed a prudence and courage which ould have fitted him admirably for heading the insurrecon; but the Greeks are slaves to titles and family names, d George, who had no pretensions to rank, held only a bordinate situation. Quiet, modest, averse to intrigue, e seems, says Mr Gordon, to have been a real hero, inspird with sincere devotion, sublime courage, and an enthuastic love of his country. With his death, on the 26th f August, all resistance ceased in the principalities. The tention of the insurgents was to erect European Turkey to a province for Prince Ipsilanti.

From the beginning of 1821 secret conferences were eld by the more zealous Hetairists of the Morea, and a pirit of insubordination began to appear amongst the peoe. At length, on the 2d of April, the standard of indendence was hoisted at Kalavrita, a town about thirty iles south-east from Patras, by Germanos, archbishop of ripolizza, and Andreas Londos. Two days afterwards the ghting began at Patras, where the Christian inhabitants se on the Turks, and, during a bloody struggle of some ys, a part of the town was burned. The Turks, however, tained the citadel, from which the Greeks had no means f expelling them; and Yusuf Pasha crossing the straits f Lepanto, the armed insurgents suddenly fled, leaving eir brethren in the town to be butchered by the Turks. he insurrection spread with such rapidity over the Morea, at seven days after the first shot was fired, a Greek sete assembled at Calamata in Messina, under the presiency of Petras Mavromichalis, bey of Maina. A partisan arfare was carried on for some time against the small boes of Mahommedan settlers living in the country, most of hom ultimately sought refuge in Tripolizza, the capital of e Morea. Meanwhile three thousand Albanians coming om the north, victualled the Acrocorinthus, and advanng to Argos, routed a body of Greeks posted there, killing even hundred of them, and afterwards burned the town. he Kihaya Bey then proceeded to Tripolizza, and seemed solved to act with vigour. The Greeks, who had now sembled a considerable force, were divided as to the ode of acting; but it was finally determined to fight, and ey accordingly posted themselves at Valtezza, near the emy. The Kihaya Bey, leaving Tripolizza with five thound troops, attacked them on the 27th of May, but was pulsed in several attacks made on the village in that and e following day, and finally fled to Tripolizza, with the ss of two pieces of cannon and four hundred men. This ctory, though small, had a great moral effect in raising e courage of the Greeks. The three great seats of Greek mmerce, Hydra, Spezzia, and Psyra, entered into the volutionary cause about the same time with the towns n the mainland. A small fleet of Hydriot and Spezziot vesls visited the other isles of the Ægean, proclaiming the dependence of Greece, and was everywhere received ith enthusiasm; whilst light-armed ships scoured the seas, d captured every Ottoman trader.

In Rumelia the insurrection broke out a few days later. he Armatolis, a sort of stationary Christian militia, in e mountains of Acarnania, Ætolia, and Thessaly, kept up y the Turkish government for the purposes of police, ere unwilling to risk the loss of their pay. The peasants f Attica and Bœotia, however, took the field in the beinning of May; and on the 7th of that month, scaling the w wall which surrounds Athens, took possession of the wn, and drove the Turkish inhabitants into the citadel. n Epirus, the remnant of the brave Suliotes, reinforced by ther Greeks, and encouraged by Ali Pasha, harassed the Seraskier Kourschid Pasha, by cutting off his convoys of provisions. The scene of these hostilities was chiefly in the ancient Thesprotia, and it was carried on with great activity in May by Marco Bozzaris. From this district it spread into Acarnania and Ætolia; the independent flag was hoisted in Messalonghi in June, by several of the Armatoli chiefs; Vrakhori, a Mahommedan town twenty miles north of Messalonghi, was carried very gallantly, and some weeks afterwards Zarpandi in the same district; Salona was next taken; and the Turks in three months were deprived of a large proportion of the posts which they had occupied south of Mount Œta. Kourschid Pasha, however, made a vigorous opposition, and success often changed sides. In this desultory warfare the summer passed away. The Rumeliots, in the various actions fought, showed themselves much better soldiers than the Moreots, and this reputation they continued to maintain during the war. Whilst these events were passing, Mavrocordato arrived at Messalonghi from Leghorn, and, after conferring with the primates, went to Tripolizza, where the Moreot leaders were assembled for the siege. Finding he was an object of jealousy to Demetrius Ipsilanti, he returned to Messalonghi in September, and laboured to organize the insurrection in Rumelia. In the mean time the Pasha Omar, with a body of four thousand Turkish troops, marched from Thessaly, routed a party of seven hundred Greeks at Thermopylæ, a second larger party under Odysseus at Seripu, and destroyed Livadia, the most flourishing town of Rumelia. He then advanced to Athens, and on the 30th of July relieved the citadel, in which sixteen hundred Turks had been blockaded for eighty-three days, by a motley army consisting of Attic peasants, Æginetans, and other islanders. The armed Greeks retired to Salamis and Ægina, and the Albanians of the pasha's army plundered and wasted the country. The Greeks now collected in small corps in the hilly districts of Bœotia and Phocis, straitening the communications of the Turks, and cutting off their supplies. A strong reinforcement coming to the latter from Thessaly, was routed at Thermopylæ by Odysseus, with the loss of eight hundred men. The pasha shortly afterwards withdrew from Attica and Bœotia, and the Athenians from Salamis re-occupied the town, and resumed the blockade of the citadel in November. In the extreme north the insurrection had been unfortunate. The Macedonian Greeks, who had taken refuge in the peninsula of Pallene, had their line of defence at Isthmus forced by Aboulaboud, and, except a portion who escaped by sea, were either killed or made prisoners. The monks of Athos capitulated to the same pasha, after two thousand of them had left the mountain. The people of Magnesia, when dividing the booty they had taken from the Mahommedans, were surprised and routed by the Pasha of Drama. A part sought shelter in the forests of Pelion, and part fortified themselves in the peninsula of Trikeri, or fled to the neighbouring isles of Scopelos and Skiathos. The thirty-five neat and flourishing villages of the district were mostly burned by the Turks. The Olympians, or Greeks of Pieria, also rose in arms, but at too late a period. The Pasha Aboulaboud had previously subdued the Christians of Athos and Macedonia, and being able to bring his whole force against them, routed them, and burned the 120 villages they possessed in the valleys of Olympus.

The Greeks of Macedonia, cruelly used by the Pasha of Salonica, were driven by despair to take up arms. Unable, however, to make head in the plain country against the Ottoman cavalry, they retreated to the peninsula of Cassandra, abandoning seventy villages, which the Turks burned. We must explain, however, that the rage of the Turks was excited to fury by the discovery of a plot formed by a Hydriot captain, to fire the arsenal at Constantinople, kill the sultan, and raise the Greek population.

The government, alarmed by this event, seized and executed the leading individuals of the Fanariot families, whilst some thousands of the other Christian inhabitants were massacred in their houses, without the least regard to legal forms. The death of the patriarch, a very old man, much esteemed for his virtues, and of a number of the other high clergy, created a great sensation. Salonica, Adrianople, and Smyrna, were the scene of similar barbarities. The last of these towns, in particular, was consigned to a general sack, like a city stormed. Kydonia, a Greek town with thirty thousand inhabitants, which had grown up in a few years, and was renowned for its college, where three hundred students received a superior education, falling under the suspicion of the Turks, was burned to the ground, and its people were forced to seek refuge in Psyra and other isles. The Greek ships, which were merely merchant vessels, carrying from twelve to twenty-four guns, would have been impotent against any navy but the Turkish; but by their superior seamanship, and a bold and skilful use of brulots or fire-ships, they often baffled or defeated strong squadrons of large men of war. Their first exploit of this kind was the burning of a Turkish seventy-four on the coast of Mytelene in June. This paralysed the operations of the capitan-bey for a little; but setting forward again, he arrived at Samos, the poor but brave inhabitants of which, forty thousand in number, had slain their Ottoman rulers, and now harassed the Turks of the neighbouring continent by frequent descents upon the coast. A large land force was collected to subdue them, and the capitan-bey attended with the fleet to co-operate. But the Turks were defeated with great loss in an attempt to land a thousand men, and a second armament was intercepted by the Greek fleet, who burned ten transports, whilst the soldiers escaped to the shore. The troops after this refused to embark. The Greek and Turkish fleets manœuvred in presence of each other, but parted without fighting, after the former had burned several fire-ships without effect.

Demetrius Ipsilanti, second brother of Alexander, travelling in disguise from Russia, landed at Hydra in June, and thence sailed over to the continent, where he was welcomed with extraordinary demonstrations of joy. He brought a small supply of money and arms, and a commission from his brother, investing him with the supreme command of the army. Patriotic, upright, brave, and accomplished, he unfortunately wanted the energy necessary for the post he assumed, and soon found himself thwarted in his views, and rendered incapable of effecting any thing, by the jealousy of the bishops and military chiefs. Prince Mavrocordato, another Greek of noble descent and considerable talents, arrived in the Morea a few weeks later. The Turks at this time were driven out of the open country, but held nine fortresses in the Morea, Patras, the castle at the adjoining straits, Navarin, Coron, Modon, Nauplia, Acrocorinthus, Monemvasia, and Tripolizza. The Greeks wanted both materials and skill for conducting regular sieges, and merely kept most of these places blockaded less or more strictly. Monemvasia, and afterwards Navarin, surrendered in August, in consequence of famine. The one capitulation was pretty faithfully kept; the other was most disgracefully violated by the massacre of the Turks, to whom a safe retreat had been guaranteed. The siege of Tripolizza was pressed with a little more vigour, as it was the capital of the peninsula, and contained a number of wealthy Turks, whose property was looked to as the prize of conquest. The city was defended by a wall fourteen feet high and two miles in circuit, flanked by a few towers with cannon, and its population was increased by refugees to 25,000 souls. The besieging army amounted to about 4500 men, which was less than the number of adults within the walls; it gradually swelled, however, as the increasing scarcity in the town multiplied the chances of a surrender. The contest was carried on by trifling skirmishes, till the Turkish cavalry, which was the only force dreaded by the Greeks, being entirely ruined, the besiegers were enabled to invest the place more closely. Famine was now doing its work upon the unhappy Moslemins, who were negotiating for a capitulation on the 5th of October, when some Greeks mounting a part of the wall which had been neglected (there was no truce), entered the town, and were immediately followed by the rest of the army. The place was completely sacked, and of ten or twelve thousand inhabitants, young and old, of both sexes, still remaining in it, about eight thousand are supposed to have been slain. A number of women were carried off as captives, and a few officers were spared for the sake of the ransom expected for them. Some Turks sold their lives dearly, and a party of forty cut their way through the Greeks, and escaped to Nauplia. The booty in money, shawls, jewels, dresses, pistols, sabres, and other articles, was very great, and led to petty contests amongst the victors. The town presented the aspect of a ruin. As a small counterpoise to this loss, the capitan-bey destroyed the village of Galixidi, near Salona, and carried off thirty-four small trading vessels, the property of its industrious inhabitants. The Ottoman fleet at the same time revictualled Modon, Coron, and Patras. The Greeks made an attempt to surprise Nauplia, which would have succeeded but for the cowardice of the Moreots; and a large body blockading the castle of Patras were, owing to their gross carelessness, surprised and routed by a party of Turks who crossed at Lepanto. Thus terminated the year 1821.

The Turks of Crete, inspired with alarm by the appearance of Greek cruisers in the adjacent seas, began to strip the Christian inhabitants of their arms, and to butcher many of them in cold blood. A number of the latter, comprehending the brave and hardy mountaineers of Sphakia, were driven by this cruel usage to fight for their lives. In July, August, and September 1821, the insurgents, about twelve hundred in number, repeatedly defeated large bodies of Turks; but the pasha at length collecting an army of ten thousand men, overpowered them, and burned most of their villages.

A national assembly convoked by Prince Ipsilanti had met at Argos about the end of 1821, but finding that position insecure, it removed to Piada, near the ancient Epidaurus, in January 1822. The assembly chose Mavrocordato president, and adopted an organic law or constitution, framed on republican principles. The government was to consist of a senate of seventy members elected annually by the people, and an executive council of five persons. The constitution enacted equality of rights, the freedom of the press, and toleration in religion. The government was then organized. The executive council consisted of Mavrocordato, president; Kanakaris, Logotheti, Delhyani, and Orlando, members; and Theodore Negris, secretary. Seven ministers were also appointed for finance, foreign affairs, war, &c., whose names it is unnecessary to give. After passing a decree for a loan of 5,000,000 of piastres, the assembly closed its session on the 20th of January. The government thus erected proved a mere phantom. It had no means of coercing the military chiefs, who set its powers at defiance, and disdained even to pay it marks of outward respect.

The citadel of Corinth, a post of great importance, surrendered on the 26th of January 1822, when the Turks were inhumanly slaughtered, in violation of a compact to convey them away in safety. The Greek government fixed itself here for some months, and issued a variety of decrees, which were very little attended to. The death of Ali, pasha of Yanina, who was shot by the Turks in February, after ving himself up on a promise of personal safety, made a onsiderable change in the position of the Greeks. Kourhid Pasha shortly after sent an army of 17,000 men to tack the Suliotes, who, though numbering only 4000 warors, including Epirots, made so obstinate a resistance with e aid of their rocks and woods, that the Turks were finally ompelled to retreat with a heavy loss, and the pasha had o resource but to turn his active hostilities into a blockade. avrocordato arrived at Messalonghi in June, commissioned act as captain-general of Western Greece. Anxious to ccour the Suliotes, he marched northward with 3000 men Petta near Arta. Here he was attacked by 10,000 Turks, d in consequence of the treachery of Gogos, one of the rmatoli chiefs, his little army was overpowered, and lost ur hundred men, including two thirds of the small corps of sciplined Philhellenes. He made his way back to Messalonghi; and the Suliotes, reduced to extremity, signed a pitulation with the pasha, by which the existing remnant three hundred and twenty men, and nine hundred women nd children, were transported to Cephalonia, with their arms nd baggage, at the pasha's expense, with a douceur of two undred thousand piastres superadded. Released from this oublesome enemy, Omar Pasha approached Messalonghi October with ten thousand men. The town had scarceany defences, and the garrison being under four hunred men, he might have carried it by a *coup-de-main.* e spent some weeks, however, in a state of inaction, or trifling negotiations, and this interval Mavrocordato digently improved, by raising new works, whilst a reinforceent of men from the Morea increased the garrison to upards of 2000 men, and the Greek fleet brought supplies of mmunition and arms. The rainy season too having set in, read sickness through the Turkish camp; and the pasha, ow aware of his error, and anxious to retrieve it, attemptd to carry the works by escalade before daylight on Christas morning, when he supposed the Greeks would be at eir devotions. They had previous information, however, nd beat back the Albanians at every point, with the loss f six hundred men. The pasha now began his retreat, obructed by the swoln rivers, and harassed at every step y the Acarnanians, who where up in arms; he reached revisa with the wrecks of his army in February 1823.

In the Ægean Sea the spring of 1823 was marked by he most unfortunate and tragical event which distinguishd the revolution; the entire destruction of the happy and rosperous Greek community of Scio. This island conined 100,000 Christian inhabitants, whose peaceful haits, intelligence, industry, and wealth, exhibited a picture f civilization unrivalled in the other parts of the Turkish mpire. They were unwarlike, but being mildly governd, they desired no change. When the Hydriot fleet apeared, they entreated the admiral to leave their coast, and ot compromise them with the Porte. Two adventurers, owever, one of them a Sciot by birth, who had spent is life abroad, the other a Samian, in an evil hour, planed an expedition to dislodge the Turks, which was too eeble and ill supported to accomplish its object, but strong nough to alarm the Porte, and bring ruin on the unhappy landers. Leaving Samos in March 1822, with a flotilla f eight brigs and thirty launches, filled with one or two housand men, the two adventurers, Bournia and Logoheti, disembarked near Scio, and entered the town without xperiencing any resistance. They were coolly received y the inhabitants, who dreaded the vengeance of the urks; but the citadel with a stout garrison held out gainst them, and disturbed them by frequent sallies. A onth passed away thus, when the Ottoman fleet suddenappeared before the town, and driving off the few Greek hips stationed there, conveyed over a part of an army of hirty thousand men collected on the opposite Asiatic oast, which is only ten miles distant. The Turks carried the town by assault on the 15th of April, putting to death the men, young and old, without mercy, and not even sparing women and children. A part of the town was burned, and what escaped the fire was destroyed otherwise. For a month crowds of armed barbarians wandered over the island, wasting and plundering. It was calculated that 25,000 of the Sciots were slaughtered, and 45,000 dragged into slavery; 15,000 were saved at first in the Mastic villages, the property of the sultan, but were afterwards massacred; the rest escaped, or were absent when the catastrophe occurred; but those who saved their lives lost every thing else, and the most opulent families of which Greece could boast were thus reduced in an instant to beggary. In August the island did not contain above 1800 Greeks, out of the 100,000 who peopled it in March. If the Hydriot fleet had appeared in proper time, the Turks could have been prevented from disembarking, and, with moderate diligence, the town might have been secured against a sudden assault. But the insurrection was no less rashly planned than ill conducted, and the horrors in which it terminated filled all Greece with unavailing lamentations. A strong fleet sailed from Hydra when it was too late; but it achieved nothing except burning the Turkish admiral's ship, in which more than 2000 men perished. This exploit was accomplished in a very gallant manner, by Canaris, a high-spirited patriot, whose name, and that of Miaulis, are associated with the most brilliant achievements of the Greek navy in the history of the war.

In Eastern Greece a desultory warfare was carried on in the spring of 1822. The Greeks of Mount Œta, Othrys, and Pelion, harassed the Turks in the south-eastern plains of Thessaly, but without gaining any advantage. An attempt was made to dispossess the Mahommedans of Eubœa, but it miscarried. The Athenians had tried to bombard their citadel, but they wanted skill and an adequate supply of projectiles; they then mined parts of the wall, but could not produce a practicable breach. At length, however, famine did their work. The Turks capitulated on the 22d of June, and though their personal safety was guaranteed, a large number of them were, as usual, massacred in cold blood, and the rest were saved with difficulty by the Frank consuls.

Koursehid Pasha had been collecting a large force in Thessaly, but the Greeks, with their usual negligence and want of foresight, though apprised of the fact, made no defensive arrangements till the enemy was in the heart of their country. The Turkish army, twenty or thirty thousand strong, chiefly cavalry, with a small body of infantry and artillery, crossed the Sperchius, seized the defiles of Mount Œta, and entered Bœotia in the beginning of July. Odysseus, who had charge of the Pass of Thermopylæ with 4000 men, either from weakness or treachery, offered no resistance. The Pasha Dramali, the commander of this army, burned Thebes, passed Cythæron and the Dervend of the isthmus unopposed; and the impregnable castle of Corinth, though victualled for three months, fell into his hands by the pusillanimity of the garrison, without firing a shot. From Corinth he pushed on to Nauplia, the Greeks everywhere leaving their houses and flying in the utmost consternation at his approach. No one thought of fighting, till Demetrius Ipsilanti threw himself with a small party into the ruined castle of Argos, not with the hope of making an effectual resistance, but in order to gain time, and induce the fugitives to rally. The manœuvre succeeded. A pause took place in Dramali's operations, during which Colocotroni arrived from the interior with a considerable force, which he drew up between the mountains and the sea near Lerna, strengthening his position with some hasty works calculated to render useless the cavalry, which was the pasha's right arm. After skirmishing for one day, with little success, the Greeks wisely resolved to wait the effect of scarcity upon their enemies, having previously burned all the standing corn. The Turks soon exhausted their stock of provisions by their wasteful habits, and Dramali had neglected to secure his communications with Corinth and Northern Greece, by guarding the passes. The insalubrity of the soil, and the inconsiderate use of unripe fruit at the same time, gave birth to fevers, which cut off numbers of his men; whilst the cattle brought for food, and the cavalry horses, died in thousands from want of fodder. Pressed by these evils, and unable to force the entrenchments in his front, he began his retreat on the 5th of August. The Greeks, however, who had divined his purpose, stationed some thousand men in the mountainous defiles, who assailed him in his flight, and, besides killing 2000 of his soldiers, captured all his treasure and baggage, with a vast number of horses, mules, and camels. Many more of the Turks died at Corinth, where marsh fevers prevailed, and amongst these the commander, Mahmoud Dramali. A great number of the survivors were destroyed in an attempt to reach Patras by land; and at the commencement of winter only a small remnant was in existence of the formidable army which, three months before, seemed powerful enough to overwhelm Greece.

The Palamede, or castle of Nauplia, pressed by famine, capitulated in the end of December; and for once the Turkish prisoners were allowed to depart in safety. The Greeks who held the citadel of Athens gave up the command of it to the crafty and treacherous Odysseus, a choice of which they had reason to repent. The Turkish fleet, instead of supporting the army, sailed round the Morea to Patras, and on its way back to the Hellespont a ship of the line was burned by the intrepid Canaris.

In February 1823 a second Greek congress assembled at Astros in Argolis, and was attended by 260 deputies. Feuds ran so high between the parties that it was difficult to prevent bloodshed. It broke up at the end of April, having appointed Petro Bey president of the executive council, and fixed Tripolizza as the seat of the government. Its decrees, however, were treated with contempt by the military chiefs, who soon compelled the executive to seek refuge in Salamis. The transient gleam of prosperity caused by the retreat of the Turks had kindled a violent spirit of disunion; and the nation was now rent into factions, headed by men like Colocotroni, Petro Bey, Londos, Delhyani, Odysseus, Ghouras, and Panourias, who, having been originally *klephts* or robbers, retained the craft, ferocity, and rapacious habits of their primitive vocation, and, when the enemy was no longer present, thought of nothing but plundering the people, and assassinating one another. The men of better principles, Mavrocordato, Ipsilanti, and Conduriotti, armed only with resolutions of the national congress, had no power to awe these ruffians and their military bands into obedience. The country, in fact, was everywhere a prey to anarchy, and as early as 1823 the wiser part of the people began to broach the scheme of inviting a foreign prince to accept the sovereignty of Greece.

In the early part of the year 1823 the Turks of Eubœa made predatory incursions into Attica and Bœotia; whilst the Greek mariners of Psyra and Samos made descents on the coasts of Asia Minor, plundering the towns, and carrying off wealthy Mahommedans prisoners for the sake of the ransom obtained for their liberation. In June, however, a Turkish army of 6000 men broke into Phocis and Doris, and advanced to the neighbourhood of Athens. The Greeks, as before, avoided battles, but encamping on the heights, cut off detachments and foraging parties; and ultimately this force melted away by casualties or desertion, without accomplishing any thing of importance. An expedition undertaken by Odysseus to drive the Turks from Eubœa miscarried; and the Christians of that isle having risen in arms, were vanquished, and compelled to seek refuge in the isles of the Ægean, after witnessing the destruction of the 150 villages they possessed. The principal effort of the Turks, however, was made in Western Greece. The Pasha of Scodra led an army of 5000 Mirdites or Albanian Christians into Acarnania. Messalonghi at that time was without men or arms, and almost defenceless. Marco Bozzaris, a brave Suliote, with a small corps of his countrymen, finding himself unable to arrest the pasha in his march, conceived the bold idea of surprising him in his camp. The attack was made in the night time; but of the three parties of Souliotes, two slunk back; and the third, led by Bozzaris, consisting of only 350 men, after storming several tambourias, and making a horrible slaughter of the enemy, finding itself unsupported, retired with the loss of one third of its number, including its intrepid commander. The Pasha of Scodra now joined Omar Vrioni, and the two approached Messalonghi; but the town was by this time garrisoned and provisioned; and the Ottoman commanders having an extravagant idea of its strength, turned aside to besiege Anatolico, a paltry village a few miles distant. They bombarded it for some weeks, till the rains setting in, and spreading sickness amongst their troops, forced them to retire in November. No solicitations could induce the Pasha of Scodra to engage in the invasion of Greece a second time.

In Crete the insurrection opened in 1823 with a promise of success, which was not realized. Affendouli, the former chief of the insurgents, having lost his influence, resigned; and Tombazi, a Hydriot, and an able but rapacious man, was elected leader in his place, and dignified with the Lacedemonian title of Harmost. He arrived in Crete with 1200 Rumeliots and Moreots, and a few small armed vessels, early in the summer, and being joined by the Sphakiots, gained several advantages over the Turks. Kissamos, a fortified post, fell into his hands by capitulation, but his troops were routed at Khadeno, and failed in an attack upon the Mahommedans of Selino. The sea being in the mean time open, the Pasha of Egypt disembarked two successive bodies of disciplined troops. The last of these, which landed at Canea in September, routed the insurgents in the neighbourhood of that town, and carrying fire and sword throughout Sphakia and the other disaffected districts, completely extinguished the insurrection. In the course of the year the capitan-pasha sailed as far as Patras, and afterwards paraded his fleet about the Ægean; but the whole extent of his achievements consisted in relieving Carysto, and reducing the Magnesians of Trikeri; whilst some of his smaller vessels were run ashore and destroyed by the Greeks. The citadel of Corinth, after a blockade of nine months, surrendered in November to Nikitas, who, in terms of the contract, faithfully secured the unmolested retreat of the Mahommedans. Whilst the Greeks thus prospered externally, there was nothing but dissensions among themselves. "The members of the executive," says Mr Gordon, "with the exception of Zaimis, were no better than public robbers.... Every corner of the Morea was torn to pieces by obscure civil contests, and hardly any revenue came into the treasury."

The efforts of the Greeks to liberate themselves from the Turkish yoke had from the first excited the sympathies of Western Europe; and in 1823, when their resistance began to rise above the character of a transient rebellion, these sympathies produced small succours in men and money. In England, France, Germany, and Switzerland, subscriptions were raised, the value of which was generally sent out in ammunition or military stores. Small corps of volunteers, actuated by a fine enthusiasm, also went from Western Europe, and though universally disgusted with the treatment which they received, they always fought bravely, and often rendered very important serce. Amongst these foreigners, who received the approriate name of *Philhellenes*, no one was the object of such niversal interest as Lord Byron. His lordship disemrked at Messalonghi with 8000 dollars in specie, on the h of January 1824, and was received with the most extragant marks of joy. Shortly afterwards Lieutenant Parry rived with some small field-pieces, supplies of powder, ot, and tools, sent by the Greek committee in London. is lordship took into his pay a corps of 500 Suliotes, hose insolence and rapacity rendered it soon necessary expel them from the town, or rather to purchase their sence with a sum of money. The Rumeliots who placed them were not much better; and Byron found mself so incessantly teased for money, so distracted by e turbulence of the military, the intrigues and dissenons of the different parties, that his mental anxiety preyg on his frame, produced a shock of apoplexy, by which s health was seriously injured. A fever followed some me afterwards, and carried off this gifted man, on the th of April, amidst the lamentations of the Greeks, who oned in some degree for the vexation they had caused m, by the sincere homage which they paid, and still pay, his memory. After his death the mutual jealousies of e chiefs became more violent than ever, and the summer ssed away in a state of comparative inaction. Mavrordato advanced with 2000 men to the Gulf of Arta in ugust, and skirmished with the Turks, till the rains in ovember forced him to retire. In the east a body of urks, who penetrated into Bœotia and threatened Athens, tired without effecting any thing. Ghouras, who held e citadel of that town for Odysseus, having quarrelled ith the latter, got him into his power, and put him to ath.

The naval campaign of 1824 was signalized by two unrtunate events. The small and prosperous isle of Kas, of which Savary gives so interesting a description, as invaded by an Egyptian force, and entirely ruined, 00 of its inhabitants being sold into slavery. The Porte, eatly exasperated by the active hostilities of the Psyots, whose ships preyed on the Ottoman trading vessels, d insulted the coasts of Asia Minor, sent a powerful et against them under the capitan-pasha, with 14,000 oops on board. The island of Psyra is small and barn; its rocky coasts render disembarkation difficult; and s inhabitants, whose numbers had been increased to fifen or twenty thousand by emigration from Scio, trustg to their courage and the natural strength of their tertory, had taken no pains to secure themselves by artiial works. The small Greek fleet stationed off the harur fled at the approach of the Moslemins, who, under ver of a false attack, landed a strong force at the north tremity of the isle, and gained possession of the hill hich rises above the town. This unexpected success oduced a panic among the timid refugees, which spread om them to the Psyriots; men and women threw themlves into the boats and attempted to escape, whilst the urks entered the town unresisted, and laid it waste with e and sword. In the midst of this miserable rout, a nd of 600 refugees from Mount Olympus and other rts of Macedonia distinguished themselves by a feat of roism worthy of ancient Greece. Throwing themselves to the convent of St Nicholas, where they had placed eir wives and children, they resisted the attacks of the hole Turkish army, till two thirds of their number were lled. All hopes of relief being at an end, they resolved blow up the convent. Their fire having accordingly ased, the Turks scaled the walls on every side, when ddenly, says Gordon, the Hellenic flag was lowered, a hite banner inscribed with the words *Liberty or Death* ved in the air, a single gun gave the signal, and a emendous explosion, shaking the isle, and felt far out at sea, buried in the ruins of St Nicholas thousands of the conquerors and the remnant of the conquered. This happened on the 5th of July. Only two of the Greeks were taken alive. The loss of life was great in Psyra; and the island, which might have been saved by a little foresight and exertion, was completely ruined. After the deed was done the Greek fleet appeared, took some Turkish vessels, and destroyed a small corps of Janizaries left on the island. From Psyra the capitan-pasha proceeded to Samos, but here all his movements were watched by the Greek fleet; and his attempts to convey over an army from the mainland were not only defeated, but he lost three ships of war and a thousand men, and at last retired from the shores of Samos completely baffled.

The sultan, made sensible, by the failure of three campaigns, of the inefficiency of his own fleets and armies, delegated the task of re-conquering Greece to the Pasha of Egypt, whose ambitious views made him listen readily to the request of his nominal superior. In the beginning of August, Ibrahim, the pasha's adopted son, sailed from Alexandria with a powerful fleet of ships of war and transports, amounting altogether to 400 sail, with 17,000 men on board, 2000 horses, and a strong train of artillery. He put into the bay of Macri, the ancient Telmessus, to water, and shortly afterwards was met by the Greek fleet of seventy sail, carrying 700 guns. For more than three months Ibrahim manœuvred amongst the gulfs and isles on the coast of Caria, endeavouring to beat off the Greeks, and proceed on his voyage; but though he counted six guns and six men for every one his enemies could muster, his mariners were so wretchedly deficient in skill, that he was continually baffled, and at last thought himself fortunate in escaping to Crete in the beginning of December, with the loss of two fine frigates and four brigs of war blown up, fifty transports taken or sunk, and 4000 soldiers and seamen slain or drowned, exclusively of some thousands who died of disease.

The first Greek loan was negotiated in London in February 1824. The nominal amount was L.800,000, of which all that was available, after deducting interest, commission, sinking fund, &c. was L.280,000. It served to quicken the operations of the government, and no doubt contributed materially to the success of the fleet, and the defeat of Ibrahim. In the Morea fierce civil war raged, Colocotroni, Londos, Sisini, and other robber chiefs, setting the government at defiance. They were crushed, however, by the vigorous efforts of Colletti, the secretary; but the Rumeliots, by whose agency he put them down, proved a scourge to the country by their rapacity.

Ibrahim having procured reinforcements from Egypt during the winter, set sail from Suda in February 1825, and landed with 4000 men at Modon on the 24th, a day pregnant with sorrow to the Greeks. The success of their naval efforts in the preceding year showed that, with common activity, they might have prevented the disembarkation; but no precautions were thought of, partly from want of foresight, partly from a feeling of false security, which led them to think that the Egyptians would be as feeble adversaries as the Turks. Ibrahim attempted nothing till he had brought over additional corps, and raised his army to 11,000, and afterwards to 15,000 men. He then commenced the siege of Navarin, defeated 7000 palikars who tried to relieve it, breached the walls, carried some outworks after hard fighting, and gained possession of the place by capitulation on the 18th of May. Thence he advanced into the interior, burning the villages, which the Greeks deserted on his approach. Colocotroni endeavoured to arrest his progress in the mountainous defiles, but without success; Tripolizza was burned by its inhabitants; and Argos shared the same fate at the hands of the Egyptians. Nauplia was threatened, but

Ibrahim had no battering artillery; and dreading the want of provisions, he retreated towards Messenia. The Greeks, who had assembled to the number of 7000, attacked him near Tripolizza, but were beaten so completely that they gave up all further thoughts of resistance in the open field. In August and September the pasha ravaged the valleys of the Alpheus and the Eurotas, destroying the town of Misitra and a number of villages, and then returned to Modon. One or two gallant feats were performed by the Greeks during this unfortunate campaign. A small body of 300 men under Papa Flessas, surrounded by many thousand Egyptians, defended themselves with the bayonet and the but-ends of their muskets, till the whole perished except two, who lay hid under the slain: and at the Mills of Lerna, Ipsilanti, with a few hundred men, baffled the main body of the pasha's army.

In Northern Greece, Redschid Pasha, the most energetic of all the sultan's officers, had been intrusted with the conduct of the war. Leaving Yanina, he arrived in May before Messalonghi, which contained about 5000 of the bravest Greek soldiers, and opened trenches. The works were carried on with vigour, in the face of a most determined resistance. Elevated mounds were raised to command the batteries of the besieged, and mines were sunk; the Franklin bastion, the most exposed part of the defences, was laid open by breaching, and repeated attempts were made by the Turks to take it by assault, in one of which they at length succeeded; but the Greeks, no way daunted, sprung a small mine, and rushing upon their enemies sword in hand, dispossessed them, and following the Turks into their lines, destroyed some of their batteries. Fresh efforts were made by the pasha, and still frustrated by the courage of the Greeks, till the winter rains in October compelled Redschid to suspend his operations, and coop himself up within a fortified camp near the town. Ibrahim, who had received a great accession of force in November, now determined to try a winter campaign, and gratify the Porte by conquering Messalonghi. Marching northward, he burned the villages of Elis, and crossing the Straits of Lepanto, encamped before Messalonghi in January 1826. He began by offering terms to the besieged, which were proudly rejected. His batteries were more skilfully constructed than those of the Turks, and his artillery better served; but after he had ruined part of the town's defences, his attempts to storm were constantly defeated by the Greeks, who, in fighting hand to hand, with sword or bayonet, were vastly superior both to the Turks and Egyptians. The siege would indeed have ended in total failure, if he had not succeeded, at a great expense of life, in reducing various outworks commanding the channels of the lagoon by which the besieged communicated with the sea, and received supplies of provisions. Starvation now accomplished what arms could not achieve. After every thing edible, whether wholesome or unwholesome, was consumed, the remainder of the gallant garrison adopted the resolution of cutting their way through the enemy's lines. A deserter betrayed their plan to the pasha, who was fully prepared to receive them. Formed into two bodies, they issued from the town by moon-light on the 22d of April; a false alarm induced the one to return: the other, raising a simultaneous shout, "On, on, death to the barbarians," rushed forward with their muskets in their hands, and their sabres slung to their wrists. "Neither ditch nor breastwork," says Gordon, "neither the flashing peals of cannon and small arms, nor the bayonets of the Arabs, could arrest the tremendous shock; in a few minutes the trenches were cleared, the infantry broken, the batteries silenced, and the artillerymen slaughtered at their guns." Of the other body which returned to the town, some escaped in boats, some by wading through the lagoon, some voluntarily blew themselves up with a number of the enemy, when the latter entered the powder magazine, and not a few of the survivors died of fatigue and exhaustion before they reached Salona. The heavy loss of the Turks and Egyptians during the siege attested the superior valour of their enemies; and the heroic defence of Messalonghi may well vie with the proudest achievements of ancient Greece.

In Eastern Greece, Colonel Fabvier, a brave and zealous French officer, formed a corps of regulars or tacticos, and carrying them over to Eubœa, made an attempt on Carysto, which failed. No drilling, in fact, could induce the palikars, or Greek irregulars, who had been accustomed to rely entirely upon their strength, agility, and adroitness, to meet a steady fire when drawn up in line. Another national assembly was held at Piada in Argolis, but it effected nothing. After the fall of Messalonghi, Redschid Pasha invaded Attica, and took Athens, but failed in his attempts upon the citadel, into which, when its garrison was greatly reduced, Colonel Fabvier introduced 600 men, with a supply of powder. The glorious fall of Messalonghi had awakened an enthusiasm in Western Europe in favour of the Greek cause, and contributions to the amount of not less than L.70,000 were raised in 1826. The royal families of Bavaria, Prussia, and Sweden, and the present king of France, were amongst the contributors.

In May 1827 Ibrahim invaded the country of the Mainots, but was defeated in all his attempts to penetrate their mountain fastnesses. The rest of the summer was spent in ravaging the open country, and burning the villages, the inhabitants of which took refuge in woods and caverns. To his great mortification, none of the people made their submission, and parties of irregulars watched his movements, cutting off stragglers, and intercepting convoys. Lord Cochrane arrived in Greece in March 1827 with a steam-frigate. A very splendid frigate, built in America, also reached Ægina this year, but proved of no great use, the Hydriot mariners being unaccustomed to manage vessels of such a size. These two frigates were nearly all that the Greeks derived from a second loan of L.2,000,000 negotiated in London in February 1825.

General Church, an Englishman who had served in a Greek corps formerly kept in English pay in the Ionian Isles, arrived by invitation about the same time. They found the Greeks rent into factions furiously hostile to each other. It is a memorable fact, that whilst Ibrahim was wasting the Morea, there were no less than seven petty civil contests raging in different parts of Greece! By the influence of Church, Cochrane, and Captain Hamilton of the Cambrian, a temporary reconciliation was effected between the adverse parties, and the necessity of having a foreign chief being generally acknowledged, a congress assembled at Trœzene in April, and elected Count Capo d'Istrias president for seven years. Church was appointed general of the land forces, and Cochrane admiral of the fleet. The fortunes of Greece were now at a very low ebb; but what power remained in the country was summoned up in an expiring effort. From the Morea, the isles, and Western Greece, a force of nearly 10,000 men was collected at Salamis and the Piræus. After carrying on a war of posts, chiefly at Port Phalerus, for some time, General Church was persuaded to risk a battle with the Turks in the plain of Athens, the object being to relieve the citadel. The result was a disastrous defeat on the 5th May, in which the Greeks lost 1500 men. The remaining troops dispersed, and the citadel capitulated. The only fortified posts now in the hands of the insurgents were Nauplia and the Acrocorinthus.

Relief was, however, approaching from another quarter. From circumstances which it would be tedious t explain here, the policy of the great Christian powers hd undergone a change. A protocol had been signed at etersburg in April 1826, by the Russian and British inisters, the object of which was to effect an accommo-ction between the Porte and the insurgents, by erecting reece into a dependency of the Porte, paying a fixed tri-bte, but having the entire regulation of its own affairs. n the 6th July 1827 a treaty of intervention was signed tween France, Russia, and Britain, on the same basis. he sultan firmly denied their right of interference, for hich, however, the piracy practised by the Greeks gave em a good pretext. A naval force was sent into the editerranean to inforce the provisions of the treaty, and e belligerent parties in Greece were enjoined to sus-nd hostilities. The Greeks joyfully agreed; but Ibra-m hesitated, as the measure was not sanctioned by the ltan; and the capitan pasha, who was lying in the har-ur of Navarin with a strong Turkish fleet, having similar ruples, the warlike movements were partially continued. he combined fleets of England, France, and Russia, stood to the Bay of Navarin in order of battle on the 20th Octo-r. Though the intention of the admirals was to treat, e Turks believed they came to fight, and were anchored smooth water to receive them, and supported by batte-es on shore. Who began the battle is uncertain; but it as obstinate and bloody, and most destructive to the van-ished party. About 6000 Turks were slain, and of 120 en of war and transports, all were sunk or destroyed ex-pt twenty or thirty brigs and corvettes. The killed and ounded on the side of the allies amounted to 626. The ctory produced unbounded joy among the Greeks, and cited them to make a new attempt upon Scio, by an ex-edition under Colonel Fabvier, which, though conducted ith great courage and skill, ultimately failed. Ibrahim, see-g his communications with Egypt now cut off, obtained s father's authority, and agreed to evacuate the Morea. e sailed in the beginning of October 1828, leaving, ac-rding to stipulation, about 8000 troops in Patras, Modon, oron, Navarin, and Castle Tornese, of whom 1200 were gyptians. To avoid renewed hostilities between the reeks and Turks, a French army was sent to the Morea the autumn, and took possession of these five fortresses, e last being the only one that offered any resistance.

Count Capo d'Istrias passed from Petersburg to London d Paris in the end of 1827, and after conferring with the ritish and French ministers, he set sail from Toulon, and nded at Nauplia on the 18th of January 1828. The peo-e received him with great joy, hoping to find repose and curity under his government; and his authority was ac-nowledged at once by the military chiefs and other func-onaries of all descriptions. He was a clever and dexte-us diplomatist, but his conduct as president seems not have been judicious. Anxious to copy the centralising stem which prevails in absolute monarchies, he dissolved e municipalities, and nominated prefects, judges, and her officers, deriving their authority entirely from him-lf. Many of his appointments also gave offence: among hers, the nomination of his brother Augustin, a person of ability, to the command of Western Greece, led to the signation of General Church in 1829, after that officer d recovered all the country south of the Gulf of Arta om the Turks. The French troops, it is to be observed, nfined themselves to the Morea, such being their instruc-ons, and left the Greeks to carry on hostilities in the rth with their own means.

The Porte obstinately rejected the arrangement proposed the three powers in 1827, till it was humbled by numerous efeats in 1828 and 1829, and saw the Russian army with- a few leagues of its capital. The stipulations in behalf Greece made by Nicholas were, however, set aside by e governments of France and Britain, and it was settled that the affairs of that country should be discussed in London. The conference held there, after much deliberation finally resolved that Greece should be erected into a monarchy entirely independent of the sultan, and ruled by a Christian prince. The crown was offered, in the end of 1829, to Prince John of Saxony, who refused it; and then to Prince Leopold of Saxe-Cobourg, who agreed to accept it; but having corresponded with Capo d'Istrias, the latter artfully infused so many doubts and apprehensions into the prince's mind, that he resiled from his engagement. This was in May 1830. Other princes, it is said, were proposed, but nothing was decided; and in the mean time Greece was again falling into a state of anarchy. The popularity of Capo d'Istrias' government was of short duration. Visibly the partisan of Russia, he showed a devotion to her interests which offended all the more independent Greeks. He extinguished the freedom of the press, which the people were perhaps more eager to possess than fitted to enjoy; established a council, called the Panhellenion, which was intended to supersede the elective senate; refused to publish any account of the national finances, and threw many popular leaders into prison. These and other measures produced violent discontents, which at last broke out into open rebellion. The Mainots, whose prince he had placed in durance, were the first to throw off his authority. They were followed by the people of Hydra, who established a provisional government, at the head of which were Miaulis and Condouriotti, assisted by Mavrocordato. The French and English ships of war in the Archipelago stood neuter; but the Russian admiral, Ricord, eagerly took a part in the contest, on the side of the president. With this aid he attacked Poros, where the Greek fleet lay; but the islanders had anticipated his design, and, when the loss of their ships of war became inevitable, blew them up to prevent them falling into his hands. Whilst this contest was going on, the son and brother of Mavromichaeli, the captive bey of Maina, instigated by a feeling of revenge, came to Nauplia and assassinated the president at the door of a church, on the 9th of October 1831. One of the assassins was seized, tried, and executed, but the other escaped. A new commission of government was then appointed, consisting of Augustin Capo d'Istrias, with Coletti and Colocotroni, who thought it prudent to convoke a national assembly. Loud complaints were made that the free choice of the people was defeated by force and fraud; and when the assembly met in December, it speedily separated into two hostile bodies, one of which remained at Argos, while the other seated itself at Megara, and thence fulminated decrees against Augustin and his associates. The Moreots generally adhered to the former, the Rumeliots to the latter. Civil war now raged furiously in the country, and the peaceful cultivators were driven, as in the time of the revolutionary struggle, to desert their homes, and seek refuge in the woods and caverns. This lamentable state of things probably quickened the languid proceedings of the conference in London, who in May 1832 fixed upon Otho, second son of the king of Bavaria, as the sovereign of Greece. The prince was born in 1815, and was of course a minor; but the defect was supplied as far as possible by a council of regency. The three powers, parties to the conference, obtained an extension of territory and a better frontier for the new state, including the province of Acarnania, for which, however, a price was to be paid to the sultan; and, in order to put Otho in a condition to meet initiatory difficulties, they guaranteed a loan of L.2,400,000 for him, to be paid in three equal annual instalments. Otho landed at Nauplia on the 31st January 1833, attended by 3600 Bavarian soldiers, and was warmly welcomed by the people. The French troops had been gradually reduced, and were now entirely withdrawn. The regency commenced the work of organizing the government, made a new division of the country, disbanded the palikars, formed a small body of Greek regulars, and took some steps towards the establishment of tribunals. As might have been expected, its endeavours to introduce order soon awakened the factious spirit of the klephts or military chiefs, some of whom, including the arch-anarchist Colocotroni, were tried for plotting the overthrow of the government, convicted, and sentenced to imprisonment or exile. These are only the beginning of troubles, springing from the natural levity and turbulence of the people, and which it will require a firm government to control. The last act of the regency of which accounts have reached us was the removal of the government to Athens, which took place in December 1834.[1]

In the whole course of the war, the Greeks never had any regular army; for the attempts to form a corps of disciplined troops, and keep them in pay, always failed. Their soldiers, with the exception of some small bands of Armatoles, consisted of peasants who took up arms for a few months, when the enemy made an irruption, and fought till he was expelled, or driven into the fortresses. They made war as irregulars, seldom encountering the Turks in the field, but posting themselves in defiles, and on mountains, taking advantage of rocks, inequalities of the ground, villages, or ruined buildings; and where these were wanting, covering themselves by small temporary parapets of earth or stones, called Tambourias. The Rumeliots were excellent marksmen, and admirable at defending a post. A hundred of them planted in a ruined monastery, seldom failed to beat off one or two thousand Turks. Their defeats were chiefly owing to three circumstances: first, their entire want of cavalry, for as infantry they were superior to their enemies; secondly, their deficiency in artillery, both for service in the field, and for battering fortified posts; thirdly, their incorrigible neglect of order and discipline, in consequence of which they were often surprised and routed by a contemptibly inferior force. As obstacles to their success, we must also mention their mutual animosities, the rapacity and selfishness of their chiefs, and their habit of neglecting all advantages for the acquisition of spoil. Their fleet was better managed than their army, but its operations failed on many occasions, from the mutinous spirit of the sailors, and the habit, which they could scarcely ever be persuaded to abandon, of returning to port to see their families at the end of every month, however pressing might be the occasion for their services. With all their faults and errors, it is impossible to read the history of the revolution without feeling respect for their courage, and for the unconquerable spirit which bore them up under the most dreadful privations and reverses.

STATISTICAL VIEW OF INDEPENDENT GREECE.

It was settled by the conference of London in March 1829, that the northern or inland frontier of Greece should extend from the Gulf of Arta to the Gulf of Malia; but this was coupled with two conditions, that the sultan should be acknowledged as sovereign, and receive an annual tribute. In the following year it was resolved that Greece should enjoy entire independence; and, as an indemnity to the sultan for the loss of the tribute and titular sovereignty, the limits of the new state were contracted, so as to extend from Thermopylæ to the mouth of the Achelous, excluding Acarnania and part of Ætolia. By a later arrangement, made after Otho received the crown, the original boundary was again restored, with the consent of the Porte, which agreed to accept a sum of money for the ceded districts. This boundary commences at the north-east angle of the Gulf of Arta, passes eastward to the sources of the Sperchius, and thence follows the line of Mount Othrys to the Maliac Gulf at Zeitouni. The isle of Eubœa, the Northern Sporades, viz. Skiathos, Scopelos, Helidromia, and Skyros; the Cyclades; and the isles in the Gulfs of Ægina and Nauplia, also belong to Greece. There are four provinces, Eastern Hellas, Western Hellas, the Morea, and the Isles; and each of these is divided into eparchias or departments. Thiersch gives the following estimate of the population, which is chiefly founded on an enumeration of towns and villages, which are assumed to have a certain mean number of inhabitants each.

Eastern Hellas,[2] comprehending eleven eparchias or departments, which contain eleven towns and 585 villages.

Eparchias.	Towns.	Villages.
Megara	1	12
Attica	1	118
Thebes	1	150
Livadia	1	72
Talanti	1	66
Boudenizza (at Thermopylæ)	1	34
Zeitouni (at the Maliac Gulf)	1	29
Neapatras (on the Sperchius)	1	66
Malandrinos	1	16
Lidoriki (ancient Doris)	1	60
Salona (Locri-Ozolæ)	1	32

The towns are assumed to have 300, the villages fifty houses or families each; and reckoning four persons to a family, the population of Eastern Greece is computed to consist of 32,550 families, or 130,000 individuals.

Eastern Hellas contains 1,886,000 stremas[3] of cultivated soil, of which 720,000 belong to the nation, and 1,166,000 to individuals. Of this, 75,000 stremas are in vines, and 3700 in gardens. In 1829, there were computed to be 210,000 olive trees in the eparchias of Attica, Megara, and Salona, and a very few in other places. The cultivated soil, according to the above account, seems to form about one fifth of the whole surface, a result which we suspect contains some considerable error in excess.

Western Hellas.

This province comprehends Ætolia, Acarnania, and a part of the country of the Locri-Ozolæ. It forms twelve eparchias,[4] containing nineteen towns and 265 villages.

Eparchias.	Towns.	Villages.
Messalonghi	1	2
Anatolico	1	2
Zygos	1	20
Lepanto, with Galixidi	1	—
Beneticon	1	18

---

[1] The preceding narrative, as far as the end of 1827, is abridged from Mr Gordon's *History of the Greek Revolution*, Edinburgh, 1832, an able, impartial, and instructive work, which should be read by all who wish to understand the moral and social condition of the Greeks. The part of the narrative subsequent to 1827 is derived from various sources.

[2] The terms most in use among English and French writers are Eastern *Greece* and Western *Greece;* but these, when applied exclusively to the districts beyond the Morea, are evidently improper, and we have therefore preferred the denominations which, as we find from Thiersch, the Greeks themselves use. In the preceding part of the article we have followed Gordon in employing the more usual terms.

[3] The cultivated land is measured by the *strema*, which, according to Thiersch, is a square of forty paces (*pas*). By the pace he seems to mean a full step of three feet; and the strema, on this supposition, will be a fraction under one third of an English acre, which agrees pretty well with the statements of other writers.

[4] Thiersch says there are eleven eparchias, but enumerates twelve, and his aggregate numbers seldom agree with his details.

Eparchias.	Towns.	Villages.
Baltas	1	28
Vonizza[1]	1	11
Vlochos, with Vrachori	1	20
Xeromeros	4	23
Krabara	2	53
Apocoura	1	26
Carponisi	4	62

The population, estimated hypothetically as before, amounts, he says, to 19,000 families, and 76,000 individuals.

The cultivated land in Western Hellas amounts to 99,000 stremas, of which 179,000 belong to the nation, and 818,000 to individuals. Of these lands, 65,000 stremas are in vines, and 3650 in Corinthian grapes.

The Morea or Peloponnesus, comprehending thirty-five eparchias.

Eparchias.	Towns.	Villages.
Nauplia	2	64
Low Nachare	3	3
Argos	3	15
St Petros	9	4
Prastos	3	2
Corinth	10	8
Tripolizza	1	61
Leontari	1	53
Kalavrita	15	97
Carytene	11	119
Phanari	2	52
Androuzza	2	48
Vostizza	2	26
Patras	1	112
Gastouni	7	172
Pyrgos	2	8
New Arcadia	1	90
Navarin	1	14
Modon	1	28
Coron	1	56
Nisi	1	2
Calamata	1	17
Micromani	1	10
Embelakia	1	35
Lacedemon	21	108
Monemvasia	3	30

Kolokynthia Trigonas Malembris Phoucas	Inhabited by the Eastern *Spartiates*, or Mainots, numbering from 8000 to 10,000 families.
Stauropygos Androbysta Zygos Mylea Maina	Western *Spartiates*,[2] or Mainots, numbering 6700 families.

The Morea has eighty-six towns and boroughs (*villes et burgs*), 1335 villages, and 92,550 families, exclusive of the country of the Spartiates. Adding 15,400 families of Spartiates, the population will consist of 107,900 families, or 429,000 inhabitants. The statistical commission employed under Otho's government had received more correct returns for nine eparchias; and, taking these as a basis, the population should be 308,800 inhabitants, exclusive of the Mainots, an estimate which falls short of the former by 61,000 persons.

The returns of land in cultivation are extremely incorrect as to the Morea, exhibiting only a total of 1,776,000 stremas, of which rather more than two thirds are national property. "In general," says Thiersch, "we may reckon fifty stremas of cultivated soil for each family, which gives an aggregate of ten millions of stremas for the 400,000 inhabitants of the Morea." The real quantity of laboured land is thus presumed to exceed sixfold the returns made to the government, a circumstance proving that little authority is due to the other statements.

The Greek Islands.

The inhabited isles are thirty-three in number, exclusive of Eubœa. No eparchias are named in reference to these.

	Inhabitants.		Inhabitants.
Hydra	20,000	Thermia	2,050
Spezzia	8,000	Naxos	10,800
Poros	4,464	Paros and Antiparos	4,751
Ægina	5,572	Siphnos	4,431
Augistra	1,552	Seriphos	3,200
Salamis	1,124	Cimolos	420
Scopelos	6,515	Milo	1,458
Helidromia	240	Polycandros	1,200
Skiathos	1,532	Sicinos	1,100
Skyros	1,578	Ios	2,177
Syra	30,000	Amorgos	2,067
Tinos	22,000	Santorin	9,656
Miconos	4,012	Anaphe	643
Andros	5,000	Astypalœa	951
Cea	3,112	Eubœa	20,000

The entire number of inhabitants in the islands amounts to 176,000; and adding 429,000 for the Morea, and 206,000 for Eastern and Western Hellas, we have 811,000 for the population of the kingdom of Greece.[3] Thiersch thinks, that prior to the revolution the number of inhabitants in Continental Greece was nearly double of what it now is; but though this may be true as regards the more exposed districts, namely, Eastern and Western Hellas, the accounts given by Pouqueville would lead us to believe that the Morea is nearly as populous at present as before the war. The islands have suffered much less in the struggle than the continental districts, except Eubœa and Hydra, the latter from the decline of its trade, the former from the expulsion, first of the Christians, and latterly of the Turks, who composed a larger proportion of the population here than anywhere south of Mount Œta.

Independent Greece comprises, including the islands, according to our measurements, an area of 20,000 or 21,000 square English miles. Thiersch's estimate is 1100 square German, which is equal to 23,000 English miles; but this appears to us an exaggeration. Otho's kingdom is therefore nearly of the same extent with Denmark, or Belgium and Holland united. But in the nature of its surface it resembles Switzerland or Bavaria more than any other country in Europe; and if we suppose its population, favoured by peace and good institutions, to multiply till it rivals the most densely peopled of these states, Greece might then support about three millions of inhabitants. Commerce and manufactures, however, which enable a small spot to draw subsistence from the whole globe, may extend its capacity to nourish a large population much beyond the limits which circumscribe the powers of inland countries.

---

[1] These tables are taken from Thiersch, but much confusion arises from the practice in use among the Greeks, of sounding the B as V. Thiersch invariably puts the English B for the Greek beta, and hence has Bonizza, Blochos, Blachori, where others write Vonizza, Vlochos, Vrachori. We could not venture to exclude B entirely from the map of Greece, and were unwilling to disguise names pretty familiar, such as Vonizza, by writing it Bonizza; and we have therefore allowed Beneticon, Baltas, and various others previously unknown to us, to stand as we found them, and changed a few where usage had already fixed the spelling. We believe however the reader may pretty safely substitute V wherever B occurs in these names.

[2] The Mainots are not of Sclavonic race, as some have imagined. Gordon says, that "their language is thought to come nearer the ancient Greek than that of any other canton." He adds, "We may assert with confidence that they are the lineal descendants of the Eleuthero-Lacones, who, pent up among the crags of the snowy Taygetus, had little commixture with any foreign race, while the barren country did not tempt invasion." Vol. i. p. 150. Thiersch says that the Mainots are merely the inhabitants of one canton, and that the name in use among the people themselves is *Spartiates*.

[3] These statistical details are taken from Thiersch, tom. i. sect. 6. We have preferred *stremas* in the English form to the Greek plural *stremata*.

The revenues of the present kingdom of Greece under the grand seignior were supposed, says Thiersch, to yield 15,000,000 of francs, or L.600,000, of which more than a half remained in the hands of the local authorities. The imposts consisted of the caratch or capitation tax, the tithe or land-tax, the customs, the duties on salines, fisheries, mills, olives, &c. The first of these was abolished as a badge of slavery, and the productiveness of the others has in general greatly declined. The financial statements published by Capo d'Istrias were delusive, and offered no information worthy of confidence. Thiersch gives the following approximate amount of receipts and disbursements for the fourteen months ending 30th April 1831, from estimates published in October 1830, for the accuracy of which, however, he does not vouch.

	Phœnix.
Land-tax (dimes)	2,500,000
Customs	1,200,000
Tax on vines and currants	36,000
Tax on pasturage	300,000
Local imposts	50,000
Tax on olives	110,000
	4,196,000

The phœnix was a coin introduced by Capo d'Istrias, and was meant to be equal to one sixth part of the crown of commerce (*ecu de convention*). It has been replaced by the drachma, which is nearly of the same value, or about equal to the French franc. The 4,000,000 phœnixes, reckoned at 9d. each, would be equal to L.150,000. The expenditure for the same period was estimated at 8,500,000 phœnixes. Thiersch thinks that the revenue may be raised to 8,200,000 phœnixes, assuming the land-tax to yield 5,000,000 and the customs 2,200,000. It would serve no purpose to indulge in general speculations on statements like these, which are almost purely hypothetical.

Of the actual expenditure, the same author gives the following estimate.

	Drachmas.
Council of state	300,000
Public instruction and churches	900,000
Interior	809,000
Finances and public works	1,300,000
Justice	200,000
Army	3,500,000
Marine	1,200,000
King and court	1,000,000
	9,209,000
Probable receipts	8,000,000
Deficit	1,209,000

No provision is made here for the interest of the loan of L.2,400,000 guaranteed by the three powers, or the sinking fund to be established for its liquidation. But a resource applicable to these objects may probably be found in the sale of the national lands, which are expected to yield L.12,000,000 in thirty years.

Mr Urquhart gives an estimate of the national domains of independent Greece, which makes their value L.11,833,000. The population, according to his table, is 868,000, viz. the Morea 400,000, Eastern Greece 150,000, Western Greece 100,000, and the islands 218,000.[1]

Thiersch has gone into great detail upon the subject of primary and normal schools, academies, and a Greek university; but the whole are merely as yet plans on paper, and do not require particular notice here.

As a European power, the Greek state, though it should even by and by embrace Thessaly, Macedonia, and Albania, must remain insignificant. Its chief value lies in the basis it offers for spreading civilization over the East, a work for which the people are eminently fitted, by their enterprising spirit of commerce, and extraordinary mental activity. "Now that Greece," says Mr Urquhart, "has assumed a definite and substantial form, she can afford to discard the sympathies and the classical associations that have contributed so much to her importance. It is no longer her soil, her costume, her language, and her ruins, that interest; it is not even the emancipation of the clusters of the Ægean or the mountains of Peloponnesus, that is the reward of one of the most noble and disinterested of diplomatic achievements; it is the political regeneration of the East that we have commenced—it is the emancipation of eastern commerce that we have effected. Greece owes herself to the furtherance of these two grand and philanthropic objects.

"The political independence of the Greeks will elevate the raya of Turkey, and force the re-organization of that country. The light craft of Greece will frequent every creek of the Levant and the Euxine; her merchants, combining local experience and information with European connection and knowledge, and endowed now with political independence, will spread themselves over the whole surface of Turkey, supply their wants, excite their taste, take off their surplus produce, and, increasing their prosperity, augment their demands. Greece will become one great mart, where the manufactures of England will be distributed to the surrounding districts of Europe, Asia, and Africa, and to which the returns from these countries will be directed; she will be one free port, to link together the commerce of the East and of the West."

Greece needs repose greatly, to heal the wounds inflicted, first by the revolution, and next by the destructive civil wars which have raged in the country since the Ottomans were expelled; and if Otho's government, though a simple monarchy, succeeds in maintaining internal peace, and in securing protection to persons and property, it will be an incalculable blessing to the people. The country, ravaged by so many different parties, presents everywhere scenes of misery and desolation. Most of the villages have been burnt; the mills destroyed; the olive trees cut down; the canals for irrigation have fallen to ruin; the trade of Hydra and Spezzia is but a remnant of what it was; and a large part of the farming stock, the black cattle, horses, mules, asses, and sheep, have been carried off or slaughtered. Perhaps a greater evil than any of these is the demoralization of the people, from the habits of rapine and violence contracted in the course of their hard struggle, superadded to the vices engendered by ages of oppression under the Turks. A government enlightened and prudent, sufficiently strong to control the different factions, and the robber chiefs who head them, is the first want of the country; and, under such a government, the energetic, active character of the people would soon bring back prosperity.

[1] *Turkey and its Resources*, p. 281.

GREEN, one of the original prismatic colours exhibit-d by the refraction of the rays of light.

Green-Cloth, a board or court of justice held in the ounting-house of the king's household, composed of the rd steward and officers under him, who sit daily. To this ourt is committed the charge and superintendence of the ng's household in matters of justice and government, ith a power to correct all offenders, and to maintain the eace of the verge, or jurisdiction of the court-royal, which about two hundred yards every way from the last gate of e palace where his majesty resides. It takes its name, *ard of green cloth*, from a green cloth spread over the oard where the members sit. Without a warrant first obtined from this court, none of the king's servants can be rested for debt.

Clerks of the Green Cloth were two officers of the board green cloth, who appointed the diet of the king and his usehold; kept all records, ledgers, and papers relating ereto; and made up bills, parcels, and debentures for laries, provisions, and necessaries for the officers of the ttery, pantry, cellar, and the like. They also waited on foreign princes when entertained by his majesty. But ese clerkships have been abolished.

Green-House, or *Conservatory*, a house in a garden, ntrived for the purpose of sheltering and preserving the ost curious and tender exotic plants, which in our cliate will not bear to be exposed to the open air, especialin winter. Conservatories are generally large and beauful structures, equally ornamental and useful.

GREENLAND, or Groenland, an immense island ing to the north-east of North America, and for the most rt comprehended within the arctic circle. Formerly it was pposed to form part of the continent of America, but the scoveries of recent navigators have proved its entire seration from that country by the Arctic Ocean. Indeed, e very idea of a north-west passage from the Atlantic to e Pacific Ocean presupposed that such was the case. rom Cape Farewell, its most southern extremity, which om the mean of nine different authorities lies in lat. 59° 30′, it stretches on the one side in a north-north-westerdirection to Smith's Sound, at the top of Baffin's Bay, in . 77° 45′. On the other side of Greenland the figure of e coast is exceedingly irregular. For about ten degrees may be said generally to run in a north-north-easterly rection, describing during the first five degrees a considrable sinuosity, indented by numerous inlets of the sea. rom latitude 70° to that of 75° the direction of the coast more directly northerly, and from the latter parallel it oceeds nearly due north beyond Spitzbergen and the itude of 80°. This side of Greenland has been denomited East or Old Greenland, and the other side is distinished by the name of West Greenland. The average eadth may be about 500 miles. Such are the limits usually signed to this country. It does not appear to terminate, wever, at Smith's Sound. From this point it proceeds uth as far as the entrance to Lancaster Sound and Barw's Straits, and thence it stretches in a westerly direction several hundred miles. Captain Parry, the discoverer, lled this tract of country North Devon. To the west of are situated numerous islands, which the same navigator titled North Georgian Islands. The principal of these Cornwallis, Melville, Bathurst, and Bank's Land, the undaries of this last being unknown. To the west of ffin's Bay and Davis' Straits, and to the north of Hudn's Bay and Hudson's Straits, there is a large tract of untry, probably separated into various islands by narrow raits. Although these would appear to be disunited m Greenland, they should be included in every descripn of that region.

Greenland.

The south-eastern portion, from which a vast peninsula shoots off into Hudson's Straits, has been entitled Cumberland. Cape York, Cape Kater, Port Bowen, and so on, terminate the country towards the north-west. To the westward of these headlands lies a tract of land discovered by Captain Parry, and which he named North Somerset. At the head of Baffin's Bay are situated Southampton Island, Melville Peninsula, Cockburn Island, and some smaller islands. All these various tracts are either insular or indented by an immense bay and inlets, formed, it is probable, by the tempestuous seas and currents which here incessantly lash the shores, and which in many instances are supposed to penetrate across the most solid masses of land.

In general the discoveries which have been effected in this quarter of the globe have resulted from attempts made to discover a north-west passage to India through the Arctic Sea. The existence of such a communication is a subject which from time to time has occupied the attention of the British government for the last three centuries; and although much valuable information has been obtained by means of these voyages, the main object remains as yet unaccomplished; nor does it appear that although it were, any important benefits to commerce would be derived from it. The first discovery of Greenland, however, was the result of accident. About the middle of the ninth century, one of the numerous Scandinavian marauders who infested the seas at that period, was driven by a storm upon the coast of Iceland. The Norwegians were not long in establishing a colony on this island, which increased so rapidly that in little more than a century it was itself able to send out colonies to other parts. In the year 982, Eric, a Norwegian chief, set sail from Iceland in quest of adventures, and steering to the south-west, after a quick run discovered land. Two or three years were spent in exploring the country; and Eric being pleased with the freshness and verdure of the shores as contrasted with the vegetation of Iceland, and desirous to encourage emigration to the place, gave it the name of Greenland. On his return, he gave an exaggerated description of the newly-discovered land, in consequence of which a fleet of twenty-five sail was equipped and sent out, laden with persons of both sexes, cattle, and other necessaries for forming a settlement. Only about the half of the vessels reached their destination, but other adventurers setting out, not only from Iceland, but from Norway, the Orkneys, and other islands, in a few years a respectable colony was formed, and a regular trade established. It seems highly probable that the original colony of Greenland began about the southern promontory, near Cape Farewell, and gradually extended itself along the coast in a north-westerly direction. Beyond this first settlement another proceeded farther to the west. The former was called *Œstre Bygd*, or the eastern settlement, and the latter *Vestre Bygd*, or the western settlement. Christianity having been introduced about the beginning of the eleventh century, numerous churches and convents were built, and the country was divided into regular parishes, to which monks and other spiritual instructors were attached. The colonists, although compelled to lead a life of severe privation and hardship, continued to increase, and to extend to the north. The zeal with which the early Scandinavians pushed their settlements to the northernmost parts of Greenland is strikingly attested by a curious monument, which was discovered in 1824. It consists of a stone carved with Runic characters, which was found standing erect in the ground on the island of Kingiktorsoak, under the parallel of 73°.[1]

For some centuries the commercial intercourse between Greenland and Norway was kept up; but about the beginning of the fifteenth century all intercourse ceased, and the unfortunate colonists were cut off from the rest of mankind. The Esquimaux, the natives of the country, whom in derision the Norwegians called Scrœllings, or Dwarfs, on account of their diminutive stature, attacked the western colony, which was compelled to seek assistance from that which lay to the south-east. There can be little doubt that the scanty population was reduced by these savage invaders; but it was more effectually thinned by that dreadful pestilence called the *black death*, which desolated Europe from the year 1402 to 1404, and which extended its ravages even to Greenland. Such a waste of human life which necessarily accompanied this visitation could not readily be repaired in a thinly-peopled country. The colonies, it is believed, languished for nearly a hundred years afterwards, but became finally extinct about the commencement of the sixteenth century. This is the most probable account of the fate of the original settlers; but a notion very generally prevailed for a long time that the western settlement only had perished, the eastern one having escaped the calamity, but, from the vast accumulation of ice, had been secluded from all communication with the rest of the world. During the last century the court of Denmark repeatedly dispatched ships to ascertain if any of the eastern settlers still remained on that part of the coast which is now called East or Old Greenland, but without success. That any of the Norwegians originally settled on the eastern shores seems clearly a mistake, arising from a misapprehension of the words *east* and *west*. They do not apply to the *shores* of the country, but to the situation of the settlers upon the western coast with relation to one another. Thus the first colony, which was planted at the southern extremity of Greenland, was called the eastern settlement, and the term would naturally be frequently applied to distinguish that part of the country which it occupied; whilst the second colony, which stretched to the north-west, and seems to have been perfectly distinct from the other, although they maintained a mutual intercourse, was called the western settlement. During the last hundred years the Danes have formed numerous colonies upon the western side of Greenland, amounting to above twenty in number, and stretching from the sixtieth to the seventy-third degrees of north latitude. The whale fisheries have greatly contributed to the advancement of the colonies; and from the intimate intercourse which is now kept up with Europeans, their condition is at present more flourishing than that of the ancient settlers.

---

[1] The following is a translation of the inscription by Dr Rafer, secretary of the Royal Antiquarian Society of Copenhagen;—

There are eighteen Danish settlements, and some smaller establishments; the former are called colonies, and the latter factories. All the settlements extend from Nennortalik, in the south, to Upernavik, in the seventy-fourth degree of north latitude, and they are divided into two inspectorships. The northern inspectorship contains ten settlements. 1. The colony of Upernavik, which is the most northerly settlement. 2. The colony of Umanak, formerly Noogsoak, which was founded in 1758. It is distinguished by its excellent seal fishery, which is carried on by the Greenlanders in their kajaks or small boats, and upon the ice, and by the Danish garrison with nets, which are let down between the openings of the ice. There are here coal mines, which supply the colony with that article. 3. The colony of Ritenbenk, founded in 1725. Large quantities of seal-blubber and seal-skins are obtained from the natives. 4. The colony of Jakobshavn, or Jacob's Haven, founded in 1741, was for some time one of the most advantageous establishments in Disco Bay. 5. The colonies of Christianshaab or Christian's Hope, founded in 1734. 6. The factory of Claushavn, under it, founded in 1752, both in Disco Bay. They have a good fishery of seals and white fish, but the whale fishery is more precarious. 7. The colony of Egedesminde, or Egede's Memory, in Disco Bay, founded in the year 1759 by Captain Egede, and called after his father, Hans Egede. It consists of a great many large and small islands. The proper settlement is on the island of Ausiet. Between this and the Fox Island (Roevoe) there is a remarkably safe harbour. A great many seals are caught here, especially in nets; but the collecting of eider-down is the most important branch of industry. 8. The factories of Kronprindsens, Eiland, &c. 9. Hunde-Eiland, or Dog Island, both in Disco Bay, are settlements for the whale fishery. The first was settled in 1778, and consists of fifty large and small islands, in which there is a great deal of scurvy-grass and good turf moor. 10. The factory of Godhavn, or Good Haven, in Disco Island. The settlers subsist chiefly by the whale fishery and the produce of a coal mine, by which the settlements in Disco Bay are supplied with that article.

In the southern inspectorship there are eight settlements. 1. The colony of Holsteenborg, which was founded in 1759. 2. Kirgurtursuk. 3. Omanarsuk. These settlements subsist chiefly by the whale fishery; but about a thousand pounds of eider-down are annually collected. 4. The colony of Ny-Sukkertop is one of the most important settlements, on account of the quantity of seal-blubber which is procured there; and it has one of the safest and best harbours in the country. The colony, which was founded in the year 1755, under the name of Sukkertop, but in the year 1783 was removed much farther to the south, under the present name, is named after three pointed hills, which, at a distance, resemble sugar-loaves. 5. The colony of Godthaab, or Good Hope, the oldest in the country, was first founded in the year 1721, by Hans Egede, on the island of Kangek, which is called by the Danes Haabets-Oe, or Island of Hope, but was in 1728 removed to the continent. There belong to this colony, 6. The factory of Fiskernaes, Fisher Point, or Fisher Cape, founded in 1754. The Danes here carry on the seal fishery with nets which are fifty fathoms long, and often longer, and eight or ten fathoms deep; they are set between the islands which the seals frequent, so that numbers are taken at one draught. The settlements of the Moravian brethren are, New Herrnhut, in the neighbourhood of Godthaab, founded in 1733; and Lichtenfels, not far from Fiskernaes, founded in 1758. Here there are many remains of ancient dwellings. 7. The colony of Frederikshaab, or Frederick's Hope, founded in 1742. 8. The colony of Julianeshaab, or Juliana's Hope. This, the most southerly, and, on account of a pretty certain purchase of seal-blubber, seal-skins, and foxes skins, the most important colony, was founded in 1775, and its district extends to the most southerly point of Greenland, Statenhuk, and beyond it to a certain distance along the east side.

The population of these settlements has been reckoned at about 7000. For the administration of the colonies and the trade, there are two inspectors, and about thirty superior officers, with a number of subordinate functionaries. All these settlements are situated on the sea shore, the interior of the country being little known or visited. The other parts of Greenland will be described in the order in which they were discovered.

We shall now give a brief outline of the discovery of

" Erling Sigvatson, and Bjarne Thordarson, and Endride Oddson, erected these memorial stones, and cleared the place, on Saturday before Gagndag (the 25th of April), in the year 1135."

ne other parts of the arctic regions, which in general has ccidentally resulted from the numerous attempts made to penetrate from the Atlantic to the Pacific Ocean by a orth-west passage. During the reign of Queen Elizabeth, Frobisher, a distinguished English navigator, made everal voyages to this quarter of the globe. In 1577 he iscovered the straits which have been called after him. In the year 1585, Davis, another able seaman, came in ight of high land, which he called Mount Raleigh, being art of Cumberland Island, which lies on the west of the traits bearing the discoverer's name. In 1610 Hudson iscovered the straits and the bay which are called after im, in which he experienced a disastrous termination to is useful career. To certain rocky islands lying about he parallel of sixty-four degrees he gave the name of sles of God's Mercy. He also discovered two capes, ne of which was called Digge's Cape, and the other Villoughby Cape. In 1616, Baffin, another distinguished nglish navigator, discovered Baffin's Bay. A large inlet of the sea at the top of the former was called Smith's ound, after one of the chief promoters of discovery. rom the period in question until within the last fifteen or xteen years, no discoveries of any great importance were ade in this quarter. In the year 1818 the admiralty fitted ut two expeditions; one of which, under the command of aptain Ross, was destined for the discovery of the northwest passage; and the other, at the head of which was Lieutenant Parry, had for its object to attempt a voyage across he pole. On the continent of Greenland the first-named avigator discovered a high mountainous region to the orth of Upernavik, to which, from national predilections, he gave the name of the Arctic Highlands. It is little else han a mass of rocks, intermingled with immense blocks of e. He then proceeded to the northern extremity of Baffin's Bay, which he explored, and estimated Smith's Sound to be in lat. 77° 45′. The coast was surveyed, the positions scertained, and the appearance of the land, the situation of the islands, and the general form of the bay itself, estalished; thus confirming the discoveries of Baffin, which ad formerly been disputed. But the most important aditions to our geographical knowledge of these northern reions were made by Captain Parry, who undertook several oyages of discovery. Lancaster Sound was all along suposed to be only a large bay; an opinion which had reeived support from Captain Ross, who, in the course of his oyage, made an unsuccessful attempt to reach the extreity of it. Captain Parry, however, thought otherwise, and in 1819–1820 he succeeded in penetrating through it, and stablishing what had been much contested, the existence f a polar sea north of America. During his voyage up the arrow sea, and nearly directly westward, several headnds and wide openings towards the north and south were escried, and hastily named in passing, Croker Bay, Navy oard, Burnet Stratton, Prince Regent and Wellington nlets, Maxwell Bay, and the archipelago, to which he ave the name of the North Georgian Islands. A narrow rait, which forms a continuation of Lancaster Sound, as called Barrow's Strait. Melville Island, the most esterly of these, is upwards of a hundred miles in length, nd of about the same breadth, and lies in lat. 75° north. ere this enterprising discoverer spent two years, and raved all the rigours of an arctic winter. The sun disppeared from the horizon on the 4th of November, and as not seen till the third of February following. No inhabitants were found on these islands, and the vegetable roductions were few and short-lived. Land and sea ere covered by a thick sheet of snow, and the thermoeter during their stay averaged about sixty degrees below the freezing point. Bathurst Island and Cornwallis Island, which lie to the eastward of that upon which Parry wintered, are also of considerable size. The latter is separated by Wellington Channel from an extensive coast, which received the name of North Devon, and reaches to the shores of Baffin's Bay; but it is not known whether it forms a continuous tract with Greenland, or is composed of one or more islands.

In a subsequent voyage he explored what is denominated Melville Peninsula, a coast hitherto undescribed. He also succeeded in sailing up a narrow channel which separates Melville Peninsula from Cockburn Isle, and called it the Strait of the Fury and Hecla, after the vessels under his command.

A tract of country four hundred miles in length, and situated on the east coast of Greenland, was explored by Captains Scoresby and Clavering. It received the general appellation of the Liverpool Coast, whilst individual parts of it, bays, inlets, headlands, and the like, were named after persons eminent in science, or after private friends. There is here a mountain chain, which rises to the height of 3000 or 4000 feet, forming precipitous cliffs, which terminate in numberless peaks, cones, and pyramids. The coast was surveyed as far up as the parallel of 75°, where it was seen still to extend in a northerly direction as far as the eye could reach.

The aspect of a country subjected during the greater part of the year to an intense degree of cold, and also for several months deprived of the light of the sun, must of course be dreary and desolate in the extreme. A fall of snow in the midst of what is here called summer, only because it is not so dismal as the other parts of the year, is by no means uncommon. Towards the end of autumn it begins to descend in a regular succession of showers, which continue until every object is buried beneath a sheet of dazzling whiteness. Ice also begins to form about this time, first upon small streams and lakes, then upon larger ones and inlets of the sea, and finally upon the ocean itself, a vast extent of the surface of which is bound together by a solid chain of frost.

At Melville Island, Captain Parry found that the ice formed a thickness of from three to five inches around the sides of the ships in the space of four and twenty hours. In one instance, whilst the thermometer was twelve degrees below zero, he observed it to acquire in that time seven and a half inches in thickness. Ere the frost has reached its highest degree of intensity, the air deposits its moisture in the form of a fog, which freezes into a fine gossamer netting or into spicular icicles, dispersed throughout the atmosphere. The surface of the ocean also assumes a very remarkable aspect. It steams like a lime kiln, a phenomenon called the *frost smoke*, and caused, as in the other instances of the production of vapour, by the water being still warmer than the superincumbent atmosphere. As the cold increases both these appearances vanish; the air clears; and the sea, cooled down to the same standard, becomes a solid floor of congealed salt water. Winter now broods over the frozen continent in darkness unbroken save by the light of the moon and the stars, which serve to reveal the desolation of the scene. Haloes and other luminous meteors are also more numerous here than in lower latitudes. But the aurora borealis, in particular, is highly serviceable in breaking the monotonous gloom of an arctic winter. This brilliant meteor plays incessantly in fantastic coruscations, which have the appearance of very vivid sheet lightning, and keep up an almost constant illumination. But this serves only to discover the utter dreariness of all around. Captain Parry observes, "The sound of voices, which, during the cold weather, could be heard at a much greater distance than usual, served now and then to break the silence which reigned around us; a silence far different from that peaceable composure which characterizes the landscape of a cultivated country; it was the death-like stillness of the most dreary desolation, and the total absence of animated existence." During this cheerless period of the year, the natives, thickly covered with bear skins, remain immersed in their miserable huts, and, crowded around the stove or lamp, contrive to doze away the long and tedious night. The inside of the hut, all openings in the walls of which are carefully stopped, to exclude the piercing cold, become covered with a crust of ice; and if for an instant an aperture be made so as to admit the external air, the moisture within becomes precipitated in a shower of snow. When the frost is intensely severe, the rocks are sometimes heard to split with a loud noise; and the food of the inmates of these ice houses becomes frequently so hard as to require to be cut by a hatchet. It may be remarked, however, that the external darkness prevails only during a part of the day. Twilight exists whenever the sun is less depressed than eighteen degrees below the horizon; the limits of total obscuration occur in the latitude of 84½°, at mid-day in the winter solstice. During their detention at Melville Island, in the latitude of 74° 40′, Captain Parry's party could see to read the smallest print at noon in the middle of winter. After the sun has appeared above the horizon, and towards the end of May, the half-famished inhabitants venture forth in search of fish on the shores of the sea. In June and July the sun becomes vertical, and is always above the horizon. The heat, thus greatly augmented, gradually dissolves the chain of ice, vast masses of which, detached from the cliffs, descend on the shores with a crash like thunder. The icy covering of the ocean breaks, and, separated into vast masses, is driven about, dissevered, and dispersed, by the violence of the winds and currents. Some portions, more firmly consolidated than the rest, remain undissolved, by which several striking phenomena are produced. In particular situations, the ice of successive years is piled up into immense glaciers, the foundations of which being sapped by the sea, they descend in prodigious masses, and, being floated far into the ocean, present to the mariner a bright but fearful spectacle, by reflecting in varied tints the rays of light, yet threatening, if come into contact with, to crush to pieces the stoutest vessel. Not unfrequently they are borne to a great distance, even into lower latitudes, and at all times are appalling to the navigator, and dangerous to his bark, however strongly built. In these high latitudes, although the summer is short, the temperature is frequently oppressively sultry on land, which causes great humidity in the atmosphere; a characteristic of the arctic regions. During a period of spring and autumn, when the sun revolves in a small but complete circle above the horizon, the skies assume hues more varied and beautiful than those observed in any other climate.

The mineral productions of the arctic regions are of considerable interest to the geologist, inasmuch as some of the most precious minerals and ores have here been found. Only the shores of the country, however, have been examined, the interior remaining unexplored, on account of the eternal ice and snow under which it is buried. The east coast of Greenland is rugged and mountainous, the average elevation being about 3000 feet. There is a range called Werner Mountains, on the Liverpool Coast, which were estimated, by the distance from which they were seen, and the elevation which they assumed above the ordinary mountains, at about 6000 feet in height. The rocks, as far as they have been examined, are of the primitive formation, consisting of granite, gneiss, mica slate, hornblende slate, syenite, and clay slate. These are similar to the primitive rocks found in Britain and other countries. There are two formations of the secondary rocks, one aqueous, the other igneous. The Neptunian rocks belong to the first secondary sandstone, or coal formation; the Plutonic rocks to the secondary trap and porphyry series. The coal formation is similar to that which abounds in the vicinity of Edinburgh, and contains impressions and casts of plants which are characteristic of a tropical climate. On Melville Island, which lies in latitude 75°, specimens of the coal formation were found by Professor Jameson to contain impressions of such vegetable productions as grow within the tropics; a very interesting fact, as connected with the change of temperature which the earth appears to have undergone. The most northern part of the coast of East Greenland examined by Captain Clavering was mountainous, and principally composed of trap rocks. The west coast of Greenland is similar to that above described. The elevated parts of the country are for the most part covered with snow or ice; and in summer, although rivers appear, which are fed by the melting of the ice and snow, they are few in number and small in size. There are also lakes, some of which are of considerable magnitude, and supplied from the same source as the rivers. Springs likewise burst forth, and Giesecke mentions a tidal spring, which rises and falls with the tide, and a thermal spring, which maintains a temperature of 104°, and flows, uninterrupted by cold or storm, during the whole of the year. The islands upon this coast, of which the largest is called Disco, are similar to the continent, presenting the same bleak and wintry sterility upon a smaller scale. Four classes of rocks have been found on the coast of West Greenland; namely, primitive, secondary, tertiary, and alluvial. In the first of these, various curious and rare minerals occur, such as the cryolite, gadolinite, zircon, and tourmaline, and numerous precious stones, such as garnets, sodalite, iolite, rock-crystal, and the like. In the secondary and tertiary rocks, limestone containing fishes, and embedded amber, have been found. The geology of the islands and countries discovered by Captain Parry presents nothing very remarkable. The prevailing rocks were found to be primitive. The lands bordering on Baffin's Bay, and the islands lying at the northern extremity of it, are not much elevated above the level of the sea, the average height being 800 feet, and the highest elevations not exceeding 1500 feet.

The vegetation of a soil which for two thirds of the year is bound together by intense frost, and covered with snow several feet thick, cannot be supposed to present much variety or beauty. Even the hardy race of pine trees, which in North America during severe cold withstand the fury of the northern tempest, if they make their appearance at all within the arctic circle, dwindle into stunted shrubs, which only rise a few feet above the ground, throwing out lateral branches. But to supply this deficiency, and afford to the Esquimaux the means of making their arms and utensils, considerable quantities of drift timber are frequently thrown up on the barren shores. The most abundant plants are mosses and lichens; and these are not only copiously produced, but they possess a nutritious and salutary quality, which does not characterise those of the same species that grow in more temperate climates. Mushrooms and ferns also find the means of subsistence here; and there is a thick tufted juicy plant, of extreme fecundity, emphatically called scurvy-grass, on account of its acting as an antidote to scurvy. The different species of sorrel, especially the *rumex digynus*, were found by Captain Parry flourishing under the snow at the very farthest limits of vegetation. These are likewise antidotes to scurvy. During the short gleam of summer some beautiful specimens of the floral tribe adorn the northern fields, but the more precious fruits do not ripen under this ungenial sky. The order *algæ* or sea-weed, especially the species or tribe *fuci*, grows in great abundance, and covers the Greenland coast with submarine meadows. The singular phenomenon of *red snow*, which has excited so much interest, is now supposed to result from an assemblage of very minute vegetable bodies belonging to

Greenland.

e class of cryptogamic plants, and the natural order call-d *algæ*. The arctic mountains on which Captain Ross oserved the red snow are about 800 feet high, and ex-nd eight miles in length. Although snow is not the atural situation of this plant, it possesses a great tena-cty of life, and not only preserves its vitality in winter, ut, during the partial thawing of the snow, it multiplies as to cover a vast expanse with red suffusion.

Although vegetation be scanty and unimportant in the ctic regions, there is a remarkable profusion of animal fe. The sea, in particular, swarms with living beings, me of which are of a magnitude far surpassing any ing to be met with elsewhere. The grand article of od for supporting these numerous tribes is the genus *edusa* of Linnæus, graphically called by seamen sea-ubber. These animals are of a soft, gelatinous consis-nce, and they abound to an extraordinary extent. By r the most numerous of the medusan tribes, however, an only be discerned by the microscope ; but so plentiful re they, that about a fourth part of the Greenland sea is nged of an olive-green colour by them. This portion of e ocean is considered as the polar pasture ground, where hales are always to be met with in greatest numbers ; nd here also are found those less gigantic tribes upon hich whales prey. Animals of the class *Crustacea* stand ext in number and importance. Here are various spe-es of the crab, and above all of the shrimp, whose mul-tudes rival those of the *Medusa*, and whose carnivorous ropensities, as we are informed by Parry, are remarka-y strong. Many of the zoophitical and moluscous or-ers, and several species of marine worms, also abound. ut the cetaceous tribes are by far the largest in size, nd most important to mankind, of the numerous liv-g beings which people the northern seas. Of these the hale possesses the most enormous bulk, being sometimes xty feet in length. They have even been found of a con-derably larger size ; and there is at present (1835) exhi-iting in Edinburgh the skeleton of one which is seventy-ve feet long. Of whales there is a considerable variety ; nd the catching of them has long been a lucrative specu-tion, on account of the oil which is derived from them. ll the shores and borders of the arctic zone are crowd-d with huge amphibious races, which seem to form an in-ermediate link between whales and quadrupeds, between e mammalia of the ocean and those of the land. Amongst ese is the morse or walrus, a large and shapeless crea-ure, measuring from twelve to fifteen feet in length, and om eight to ten in circumference. Seals are very nu-erous, and constitute both the food and the clothing of e Esquimaux. Herrings are also found in immense oals amid the depths of the arctic zone. Amongst land nimals is the polar bear, whose prowess and daring ren-er him one of the most formidable of quadrupeds. The ein-deer are pretty numerous in the arctic regions dur-g summer, and afford a favourite object of chase. heir flesh is good, and the skin forms a very comfortable rticle of clothing. The musk-ox penetrates the arctic one, but in smaller numbers, and it likewise affords a holesome article of food. Several species of the canine ace are here met with in abundance. Wolves in large acks are found to brave the utmost severity of a polar inter ; and the arctic fox is met with in great numbers. he dog, however, is the most important quadruped, and e most valuable to the Esquimaux, who have succeed-d in taming and rendering it subservient to them in tra-elling and in hunting. Yoked to a sledge, these animals an draw a great weight with very considerable rapidity. he air, like the sea, is thickly peopled with appropriate habitants. The auk, the petrel, and the gull, in cluster-d myriads darken the sky, and make the rocks and shores e-echo with their wild clang. Vast flights of the swan, the goose, and the duck, also traverse these regions ; and great flocks of that species of duck called the eider, whose down is so valuable, arrive in spring on the most northern shores of Greenland. Amongst other arctic birds are terns, which produce the most delicate eggs of any water bird ; the *colymbus* (guillemot), whose skin affords a comfortable article of clothing ; the *tringa* (sand-piper) ; the *charadrius* (plover) ; and the *tetrao* (grouse and ptarmigan).

The native inhabitants of these countries are the Esquimaux, a race widely diffused over the shores of the Northern Ocean. The leading features of this people, as observed by different travellers in different parts of the arctic regions, possess considerable uniformity ; and by comparing ancient authorities with those of a more recent date, they appear to have remained the same for ages. It is believed that the Samoiedes and Kamtschadales, in Northern Asia, belong to the same family. They are not only similar to them in personal appearance, in habits, character, modes of life, and in the rude arts which they practise, but also in the language which they employ. There are different dialects in use amongst the Esquimaux, but they all display affinities which prove them to have sprung from a common root ; and this affords a presumption that an original race from some quarter of the globe has at some distant period spread over these immense and dreary solitudes. Hence it is by no means improbable that at an early period the Esquimaux connected the two continents which were otherwise entirely ignorant of the existence of each other.

Like the vegetation of these high latitudes, the human figure is dwarfish in size, and decidedly below the European standard. A man five feet nine inches in height is considered as a person of gigantic stature, and, compared with the average altitude to which they attain, as possessing amongst them the same superiority of size which a person six feet two or three inches in height does amongst us. The body is somewhat thick, but the hands and feet are small, and the fingers short. The face is generally round and flat, with prominent cheek bones, but full and plump cheeks. They are tolerably well shaped ; and the female countenance, although destitute of all pretensions to regular beauty, has a frank and good-humoured expression ; and if they would allow it to be purified of its thick incrustation of grease and dirt, it might even be accounted handsome. The flesh of these people is soft and flabby, and they have a phlegmatic constitution corresponding to this habit. The dress of the men consists chiefly in a double coat of the rein-deer ; the hairy side of the inner one being placed next the skin, whilst to the outer one there is an ample hood attached, which is drawn over the head. The breeches are also double, and of the same material, overlapping the boots, which extend to the knee ; the latter are composed either of deer skin, or, if for hunting or travel, of the hide of the seal or the walrus. The dress of the females is very nearly the same, with some slight variations in form. The chief distinction lies in their boots, which are of capacious dimensions, and, like those of Hudibras, receptacles for whatever sort of goods may come in the way of the wearer. These habiliments are rather neatly sewed together, an art in which the women display considerable dexterity. The thread they use is the sinews and some other parts of animals. There is also some taste shown in decorating them with parti-coloured stripes of skins. Like other savages, they are fond of ornaments, and contrive also to paint their bodies.

Under such a rigorous climate, much labour is necessary to secure subsistence. For nine months the ground is locked up in frost, and rendered incapable of producing any root or herb which can constitute a staple article of diet. They are, moreover, improvident, in consequence of which, combined with the precarious supply of food, they are often subjected to severe privation. Yet they are proof against the lessons of experience, and so happy is their disposition, that a moment's gratification of their wants makes them forget that they had ever suffered from hunger, or that on the morrow they may again be in the same distress. Hunting and fishing are their only resources, and of course their time is spent in pursuing, by land or sea, the wild animals by which these are inhabited. During summer, the deer is pursued with bow and arrow or the gun. and their flesh and skin are highly prized. But for the greater part of the year the Esquimaux must seek their food in the waters. In these are found plenty of cetaceous fishes, the seal, the walrus, and the whale. For the purposes of respiration, these animals rise above the water, and the moment they become visible, the Esquimaux attack them with dart or harpoon, to which they have sometimes a long line attached. The capture of a whale is the greatest of their marine achievements. On these occasions a large body of men assemble armed with a variety of weapons. The animal, when struck, plunges under water; but being obliged to rise for air, a fresh attack is made upon him, until, exhausted by fatigue and loss of blood, he falls an easy prey. These captures are shared amongst the inhabitants of the village, all the cooking pots in which are put in requisition when the arrival of one is announced, for the purpose of boiling the flesh of the animal, which is cut up into dainty slices. The cooking being finished, the feast commences by a person first extracting a large piece from the pot, and, after severing with his teeth as much as the mouth will hold, handing it to a second person, who does the same, and he to a third, and so on till the whole is devoured. There seems to be no assignable limits to the capacity of an Esquimaux stomach. He has been known to devour, in twenty-four hours, ten pounds four ounces of solid food, more than a pint of strong soup, and a gallon and a pint of water.

The attack of the polar bear is undertaken by a single Esquimaux, assisted only by his dogs, without the slightest fear or hesitation, in which case we cannot deny them the merit of great personal courage. The dogs keep the ferocious animal at bay, assailing him on all sides, whilst the master with his spear attacks the bear, and avoids, with astonishing adroitness, the furious springs of the enraged monster. In reflective intellect the Esquimaux have little to boast of. Although some of them are arch, ingenious, and jocular, no manifestations of a profound understanding have yet been discovered amongst them. In arithmetical skill they are lamentably deficient, being scarcely capable of counting as far as ten; and their taste for music is nearly at as low an ebb. Some of them, however, display a constructive talent, in exercising which the principal tool employed is the knife. Their houses are built in the following manner: When winter approaches, the ice is cut into tall square blocks, with which they construct regular spacious domes, connected with other smaller ones, for the purposes of domestic economy. For the admission of light, a round hole is cut on one side of the roof of each apartment, and a circular plate of ice, three or four inches thick, and two or three feet in diameter, is inserted in it. The light is soft and agreeable, similar to that which is transmitted by ground glass, and is quite sufficient for every purpose as long as there is any light to be derived from without. The inside of the tenement is shaped with care, and a glossy surface is then given to it by the affusion of water. The wall soon becomes a solid mass, which, being a slow conductor, checks the access of cold. It may be remarked, that the external darkness only lasts during a part of the day. "When after some time," says Captain Parry, "these edifices become covered with drift, it is only by the windows that they could be discovered as human habitations. It may then perhaps be imagined how singular is their external appearance at night, when they discover themselves only by a circular disc of light transmitted through the windows from the lamps within." The length of the best of seven canoes belonging to a tribe of Esquimaux inhabiting Winter Island, was found by Captain Parry to be twenty-five feet, the extreme breadth twenty-one inches, and the depth ten inches and a half. "The skin with which the canoe is covered is exclusively that of the small seal, prepared by scraping off the hair and fat with a knife, and stretching it tight on a frame over the fire, after which, and a good deal of chewing, it is sewn on by the women with admirable neatness and strength." In managing these boats they display great dexterity, even in the most boisterous weather. As mechanics they have little to boast of; but the Esquimaux of Greenland appear to be rather more skilful than the people described by Captain Parry. "The men," says Egede, "meddle with no work at home but what concerns their tools for hunting and fishing-tackling viz. their boats, bows, arrows, and the like. All other work, even of building and repairing the houses, belongs to the women. As dexterous and skilful as the men are at their work, so the women are not behind hand with them, but, according to their way and manner, deserve to be praised and admired." Captain Beechey found indications of considerable constructive talent in the vicinity of Behring's Strait; and Captain Franklin saw amongst the Esquimaux whom he met at Upper Savage Island, Hudson's Strait, imitations of men, women, quadrupeds, and birds, carved with labour and ingenuity out of sea-horse teeth.

In their moral character the Esquimaux inherit more than an average share of human frailty. Few savage tribes have made themselves more notorious for dishonest and thievish dispositions. Little respect indeed is entertained for the rights of property; gratitude is a virtue almost unknown amongst them; and in their habits they are exceedingly licentious, connubial infidelity being winked at as a very unimportant matter. They also display little or no sympathy or regret for the sufferings and death of neighbours, or even of relations. The Esquimaux, however, are not inclined to war; they are neither irascible nor revengeful; and they treat their offspring with the greatest tenderness. From the account given by Captain Parry of the inhabitants of Winter Island, they would appear to possess a higher moral character than that of any other of the tribes visited by Europeans. In their domestic economy, however, they are uniformly filthy, and disgusting in the extreme. "The Greenlanders," says Egede, "in their manners and common way of life, are very slovenly, nasty, and filthy; they seldom wash themselves, will eat out of plates and bowls after their dogs without cleansing them, and, what is most nauseous to behold, eat lice and such like vermin which they find upon themselves or others. They will scrape the sweat off their faces with a knife, and lick it up." Captain Lyon's description of the interior of an Esquimaux tent is to the same effect. He found accumulated "an immense heap of flesh, blubber, bones, birds, eggs, &c. which lie at the mercy of the heels of all who enter; the juices forming an intolerably filthy mud on the shingle floor. From this profusion of delicacies thus jumbled together, it may be unnecessary to add that the food of the family is selected as wanted." Details similar to the above are given by others who have visited these countries, but they are too disgusting to be quoted here.

In their religious superstitions the Esquimaux believe in a principal female deity, who is called Aywillaiyoo. She is immensely tall, having only the left eye, and a profuse allowance of pigtail, which descends to her knee, hing of a corresponding thickness. There is a chief magician, whose business is to invoke this goddess from the shades below for the purpose of giving responses to the questions of her devotees. This divinity has a giant for her father, who is fortunately, however, only furnished with one arm. Besides these mutilated deities, there are in the Esquimaux pantheon, Pamiooli, a spirit frequently invoked; and a huge bear, whose place of habitation is in the cold bosom of the eternal ice. The natives unanimously believe in a future state of blessedness, where the souls of the departed revel unchecked amidst all manner of sensual delights. They descend beneath the earth through four successive abodes, in the last of which perfect happiness is enjoyed. Here, on the margin of fresh lakes which never freeze, and in whose lucid waters the seal and the walrus abound, the blessed souls pitch their tents, and enjoy perpetual summer. The sun never sets; the deer and the birds range within bow-shot of their habitations, and are easily killed; the sea is always transparent, and the whales roll about so very tame, that they are with little difficulty harpooned, and towed to shore. Thus employed in their favourite amusements, and enjoying the feasting by which these are followed, the Esquimaux believe that their happy souls will enjoy, in a future state of existence, an eternal immunity from those harassing cares and hardships which they are doomed to endure in this world. With such fond anticipations of coming bliss do these poor savages contrive to cheer a life of extreme privation, in a state little elevated above that of the animals on which they subsist.

Such are the general features of the Esquimaux character and their mode of life, as delineated by various Europeans who have visited the countries which they inhabit. From the reports of the Moravian missionaries, those Esquimaux who are in more intimate connection with the Danes would appear to have become somewhat more civilized than the rest of their tribe who have not enjoyed the same means of improvement. The following account of their character and habits is derived from a German work of celebrity, In winter the Greenlanders dwell in houses, and in summer in tents. The houses are built of large stones, between which earth and moss are laid. The walls are very thick, and upon them a beam is placed lengthwise, across which rafters are laid. The intervening spaces are filled with small wood, over which, first a layer of heath, then another of turf, is heaped, the whole being covered with old boat or tent skins. Internally this fabric is laid out with some attention to comfort. It is divided into apartments, and two or three families generally live under one roof. The windows are made of the entrails of animals neatly sewed together; they admit the light, but are impermeable to rain. In every division of the house there is a fire-place, a lamp made of talc, and a kettle of the same material placed over it. By these fires and lamps a considerable degree of heat is kept up, which is also increased by the smoke, there being no regular chimney for its escape, and in general no door. The place of both is imperfectly supplied by a low covered passage of stones and earth, built on the long side of the house, and opening to the sea. As soon as the snow melts, the Greenlanders quit their wintry habitations, and erect their tents, which are of two kinds; one of these is of a pretty solid construction, and such as forms a fixed summer residence; the other is of a lighter nature, and can easily be removed from place to place. It generally consists of poles, upon which the skins of animals are stretched.

In their dress, the Greenlanders wear, besides a coat and breeches similar to those already described, stockings made of the skin of a young seal, shoes of the same materials tanned, and shirts made of the skins of birds, the feathers being worn inwards. The men have also a seal-skin covering when they go to sea, and sometimes a frock made of entrails for the purpose of keeping them dry. The men wear their hair short, but the women bind it in tufts over the crown of their heads. The boats consist of a light frame-work of wood, which is covered with seal-skins. There are two kinds of them; one large for the transport of goods and for the conveyance of women; the other small, and fitted to hold only one man. The top of the latter, which is called a kajak, is covered over with seal-skin, but in the middle there is a round opening for the reception of the Greenlander, who, here seated, propells himself through the deep by means of an oar, which is furnished with a broad blade at each end. With this slender vessel he swims over the billows like a sea bird, and without much dread of tempests. Upon the water the Greenlander pursues seals, birds, and whales. The former constitutes his chief wealth. It serves for food, for clothing, for covering his habitation, and its blubber supplies him with oil for his lamp. The weapons which he wields are harpoons, lances, and spears of various kinds, which he throws with great dexterity. The gun is also employed in destroying seals, but this method is not so successful as the others to which he has recourse. The whale fishery is only carried on by the Greenlanders in conjunction with the Danes. Some of the lines which they employ in fishing are made of thin slips of whalebone tied together; and they are often more than 200 fathoms in length. With these they catch certain kinds of fish peculiar to the arctic seas. They also spear salmon and salmon trout; and sometimes build dams at the mouths of rivers to facilitate the capture of these fish. Hunting is more an amusement to the Greenlanders than a source of wealth, and it is chiefly confined to the chase of the rein-deer. They now employ fire-arms instead of the bows and arrows which were formerly in use. The flesh of the deer is a favourite article of food, but the animal has now become scarce. A kind of smelt, dried in the open air, serves the Greenlander for bread and vegetables. These fish are caught in great abundance during summer, and they are stored up in leather bags for winter provision. The heads and the legs of seals are preserved under the grass in summer, and whole ones under the snow in winter. Various kinds of berries, roots, and herbs are used as food; and bears' flesh, together with the tails and skins of whales, are favourite dishes. Train oil, according to our authority, does not constitute an article of diet with the Greenlanders; and in their domestic habits they are not so abominably filthy as the other races of Esquimaux, although from their poverty and lazy habits they are very uncleanly. In their moral deportment the Greenlanders are said to be more amiable than the other races of Esquimaux already described. They are sociable, open hearted, cheerful, and contented. They live in great harmony with each other, and a propensity to thieving is by no means a feature of their character. This, however, can only apply to those who may be said to be immediately in connection with the Moravian missionary stations. They all possess a considerable degree of self-esteem, national pride, and vanity; and, like the rest of their race, they are careless of the future, spending the best part of the summer more in amusing themselves by hunting the rein-deer, than in laying up a stock of fish for the winter. Their religious creed is similar to that which is professed by the Esquimaux in general, but many of them have adopted all the external forms of Christianity. The Moravians, besides labouring in their pious avocations themselves, have educated some of the natives as missionaries, whose preaching has been productive of good. But the conversion of the Greenlanders advances very slowly, and exerts little influence over their moral ideas. They are inclined to look upon the Christian worship as a useless ceremony, whilst they consider criminal punishment as an unjust abuse of power. They moreover accuse the Danes and other European visitors of having introduced amongst them the double scourge of small-pox and spirituous liquors. Their language is remarkable for the copiousness of its grammatical forms. Their particles are as numerous and as varied as in the Greek; but the rule which directs them to introduce into the verb all the parts of the sentence, gives rise to words of a disproportionate length. The consonants *r*, *k*, and *t* predominate in this language, and produce harsh sounds by their frequent recurrence. The Greenlanders of the north speak a dialect unintelligible to those of the south; according to Captain Ross it is called *Kumooke.* The Greenlanders sometimes call themselves *Innouk*, or brothers; but their real national name appears to be *Kalalit*, and they commonly designate their country by the name of Kalalit Nounet. Denmark, the mother country, sends out annually a vessel laden with provisions and the materials of trade, and receives in return skins, blubber, feathers, and the tusks of the narwal. The Greenland company established at Copenhagen estimates its annual revenue at from L.20,000 to L.25,000 sterling. According to the statistics of Denmark for 1832, the population of Greenland amounts to 7000. This probably only includes those who hold allegiance to the Danes; of the amount of population scattered over the arctic territories, no conjecture approaching to the truth can be formed. (R. R. R.)

GREENOCK, a sea-port town of Scotland, in the shire of Renfrew. It is beautifully situated on the south bank of the Frith of Clyde, about twenty-two miles below Glasgow, in latitude 55° 57′ 2″ N. and longitude 4° 45′ 30″ W. In front of the town there is a fine and extensive bay, formerly known by the name of the Bay of St Lawrence, from a religious house which anciently stood there. Behind the town the land rises into a picturesque ridge of hills, about eight hundred feet high, between which and the bay Greenock stretches for about two miles and a half along the shore; but its breadth is inconsiderable, although it occasionally ascends to some height up the sides of the mountain chain. Greenock is not exempted from the common fate incident to towns in reference to the origin of their names. Its name is supposed to be derived from the compound Gaelic word *Grianaig*, *grian* signifying sun, and *aig* port or bay. This hypothesis receives support from the circumstance that the bay in which the town is built is directly opposite to the rising sun; and it seems probable that this may have been a station where the Celtic aborigines, who worshipped the sun, hailed his appearance. Others trace the origin of the name to a wide-spreading oak which once grew upon the shore; but this theory has few supporters.

Although Greenock is now the first sea-port of Scotland, it has risen to its present eminence since the union of the kingdoms. Previously to that period it was a mere fishing village, connected with a barony of ancient date under the family of Shaw. In 1589 James VI. granted leave to Shaw, the baron, to erect a place of worship for the convenience of the inhabitants of the district. In 1594 the estates of Shaw were erected into an independent parsonage and vicarage; and these again were in 1636 constituted a parish under the title of the parish of Greenock. As it is to its quays that Greenock owes its prosperity, we shall trace their origin, extension, and present state, together with the commerce thereby carried on, previously to describing the town.

In 1696 and 1700 Sir John Shaw made application to the Scottish parliament for public aid to build a harbour at Greenock; but his applications were unsuccessful. At this period there was only an insignificant landing-place, unfit for the reception of vessels; a disadvantage which the inhabitants felt so much, that in 1707 they agreed with their superior to allow themselves to be assessed at a certain rate to liquidate the expense of building a proper pier and harbour, which work was finished in 1710; and in the same year Greenock was established a custom-house port, and a branch of Port-Glasgow. For the time at which it was erected the work was a formidable undertaking. But although it cost L.5555, the whole sum was liquidated in less than thirty years, the trade created by this means not only bringing an accession of wealth, but also of inhabitants. In 1783 the harbour-dues amounted to L.111. 4s. 8d., and in 1792 to L.812. 9s. Of the original harbours scarcely a vestige remains, successive repairs and new erections having obliterated the traces of them. Six acts of parliament have been obtained for regulating the affairs of the port; the first was passed in 1773, and the sixth in 1817.

A dock was built in 1785, at an expense of L.4000; but from the increase of trade, one of more ample dimensions was found indispensable. Meetings were held at various times for the purpose of facilitating this project, and, in 1818, the harbour trustees finally resolved upon carrying it into effect. The work was finished in 1824, at an expense of L.20,000; but the harbours and new dry dock, together with the appurtenances thereto belonging, such as the lots of ground where warehouses and sheds might be erected, or which might be laid out as bonding yards for wood, have cost L.119,000. These works are considered to be as commodious and elegant as any in the kingdom; and, with the new erection eastward, which has been recently finished, they are in these respects scarcely surpassed anywhere. The following measurements show the extent of the quays, and their accommodation:

	Feet.
East quay	531
Entrance to harbour	105
Custom-house quay	1035
Entrance to harbour	105
West quay	425
Extreme length from east to west	2201
Breadth of piers	60

Along with the town council, commissioners, who are annually elected, manage the affairs of the harbour.

Greenock enjoys coasting and foreign trade to a very considerable extent. Vessels from the Clyde are to be found in every port to which British enterprise has penetrated. The first vessel belonging to this port crossed the Atlantic in 1719; but shortly afterwards the shipping rapidly increased, for the union had now opened up its full prospects to Scottish industry. With such rapidity did Greenock extend her maritime relations, that the jealousy of the traders of London, Liverpool, and Bristol, was excited. They accused the merchants of Greenock and Port-Glasgow of defrauding the revenue; but the charge was triumphantly refuted. The earliest trade seems to have been in herrings, and it is still continued, the amount cured annually averaging about 19,000 barrels. Trading in tobacco was also carried on at a very early period. It was first brought from the colonies, and then exported to the Continent. The Greenland whale-fishing commenced as far back as 1752, but it never rose to be of any importance, and is now discontinued. The disruption of America from Great Britain greatly depressed the commerce of Greenock, for at that period the most considerable trade of the port was with that country. At present the principal intercourse is with the East and West Indies, and with North America. Newfoundland and South America have also employed a considerable quantity of shipping. The gradual increase of trade is shown by the following tables:

Account of the Gross Receipt of the Customs at the Port of Greenock, in the Years 1728, 1770, 1802, 1822, 1828, 1831, 1833, *and* 1834.

1835	1,376,526

Previously to 1751, Greenock, like other burghs of barony, was vested in the hands of the lord of the manor, or baron. The town was now, by a charter from Sir John Shaw, enabled to elect a regular magistracy, consisting of two bailies, a treasurer, and six councillors, possessed of various powers.

Although Greenock has a somewhat irregular appearance, it contains several elegant streets, and many excellent buildings. The town is stretching towards the west, where of late years the most spacious streets have been erected. A number of beautiful villas are scattered from east to west, and along the heights behind the town, from which the view is striking. Amongst the public structures which deserve to be noticed is the custom-house. It is situated in the centre of the quay, where it is seen to much advantage. The structure is handsomely built in the Grecian style; the portico, in particular, is considered very elegant. It was erected in 1818, at a cost of L.30,000. The Tontine is a substantial and handsome building, containing one large hall and many small rooms. It was erected in 1801, at an expense of L.10,000. Nearly opposite to this elegant house stand the Exchange Buildings, which were finished in 1814, at a cost of L.7000. They contain, besides two spacious assembly-rooms, a coffee-room, which is excellently conducted; and on the western side is the Greenock Bank, which was instituted in 1785, and has ever since issued notes. Besides this bank there are other two banking establishments. The town-hall and public offices were built in 1765, after a plan by James Watt. A public office is connected with this structure. Amongst other public buildings there is an hospital or infirmary, erected in 1809, by the charity of the inhabitants. In connection with this establishment it may be mentioned, that the medical faculty of Greenock were in 1820 incorporated into a body under the name of the Greenock Medical and Chirurgical Association. In 1810 the jail or bridewell was built. It is situated in a fine open space enclosed by a wall, and is the only place appropriated to the reception of criminals. In 1820 a new coffee-room was erected. It is conducted upon the same liberal principles as the other one connected with the Exchange. In 1828 a gas-work was constructed at an expense of L.8731.

Greenock.

One of the most extraordinary works of the kind to be met with in any country is that by which the town is plentifully supplied with water, and machinery to a considerable extent is impelled. This consists of an immense artificial lake or reservoir situated in the bosom of the neighbouring alpine region, formed by turning the course of a number of small streams, and making them pour their waters into a hollow basin prepared for their reception. From this "Caspian" an aqueduct passes off along the mountain range, and for several miles it runs at an elevation of five hundred feet above the level of the sea. In the vicinity of the town it pours down a torrent of water in successive falls, and impels a number of mills erected on its course. The whole length of the aqueduct is six and a half miles; the great reservoir covers 294$\frac{3}{4}$ imperial acres of land; and there is a compensation reservoir covering forty acres of ground, besides other smaller basins. A series of self-acting sluices have been constructed in a most ingenious manner, by which not only is all danger of an overflow taking place obviated, but every drop of water, even during the greatest floods, is preserved. The whole of this magnificent public work, including two expensive filters, was planned by Mr Thom, an ingenious engineer, and executed under his directions at an expense of L.52,000.

Greenock is divided into five parisnes, which are respectively termed the West, the Middle, the East, the South, and the North. The first comprehends the western part of the town and the greater part of the country district. The church is situated close by the shore, in the midst of an extensive burying ground. It is built nearly in the form of a cross, and has a small belfry on the west side. The Middle Parish, which was formed out of the above in 1741, is confined entirely to the town. The church, which was finished in 1761, stands in a small square, fronting a street which descends to the mid quay. The architecture is plain but elegant, and the fabric is surmounted by a very handsome spire, 146 feet in height. The East Parish church is a very humble place of worship, having been originally built in 1774 only as a chapel of ease. It was constituted a parish church in 1809. The South and the North Parishes were formed in 1833. Besides these places of worship, there are a number of dissenting meeting-houses; one belonging to the Original Burgher Associate Synod, built at Cartsdyke in the neighbourhood of Greenock in 1745, and re-constructed in 1828; a meeting-house of the United Associate Synod, built in 1758, in Market Street, but abandoned in 1802 for a more commodious house; another erected in Union Street in the year 1835; another in the same communion reared in 1791; and a Gaelic chapel of ease erected in the same year. The other meeting-houses or chapels are, one Congregational Union, commenced in 1800; a Relief, in 1807; a Methodist, in 1814; a Roman Catholic, in 1815; a Baptist, in 1821; a chapel of ease, in 1823; and an Episcopal, in 1824. In 1834 a chapel was built for a sect called Irvingites. Greenock is well circumstanced with regard to education. It has a grammar-school master and a teacher of mathematics, under the control of the magistrates; but the places in which they teach are rented from private individuals. It has however excellent accommodation for teaching the children of the poor, besides a school of industry for girls. A library was instituted in 1783, which now contains seven thousand volumes. But the progress of literature in Greenock has not been equal to its other improvements; for although frequent attempts have been made to institute literary and philosophical societies, none have succeeded, and at present the town is destitute of any thing of the kind deserving such a title. There are numerous charitable institutions, both for the relief of those at home and for sending aid to foreign countries. A newspaper was established in 1802, entitled the Greenock Advertiser; and another in 1833, entitled the Greenock Intelligencer. Both are now published twice a week.

Greenock possesses manufactures of some extent, the principal of which, however, are connected with the commercial pursuits of the port. Ship-building, in which line of business there are five or six establishments, is carried on with much success. There are three patent slips, one large enough to admit a vessel of 400 tons register; but the other two are of smaller dimensions. Boat-building is also a considerable branch of trade; and in connection with these naval works are several extensive roperies and sail-cloth manufactories. Another prominent branch of business is sugar-refining, which is here prosecuted to a greater extent than anywhere else in Scotland. The first house was erected in 1765, and there are now eleven. Straw-hat making is also successfully carried on; and the manufacture of hats from rye-straw, in imitation of Leghorn bonnets, has been here brought to high perfection. Amongst the other manufactures are those of silk and felt hats, pottery ware, flint glass, steam-engines, glass bottles, chain cables, and iron work; and there are likewise four breweries, two tanneries, two soap and candle works, besides other smaller establishments too common in towns of this size to require particular mention. Greenock was the birth-place of the illustrious James Watt, the great improver of the steam-engine. To perpetuate the memory of this great man, it is intended to erect a monument to his memory, for which purpose a subscription has been raised. To this sum the son of Mr Watt has added L.3000, to be appropriated to building a library, in which is to be placed a statue of Watt by Chantrey. The population of this town amounted in 1821 to 22,088, and in 1831 to 27,571, exclusive of about 3000 seamen.

Greenwich.

GREENWICH, a market town of the county of Kent, in the hundred of Blackheath, within the lathe of Sutton, and five miles from London. It is situated on the south bank of the Thames, and extends along the shore of it. Though extensive, it is a single parish, but has two churches, and several places of worship for the various dissidents from the established religion. The most attractive object is the royal hospital, for aged, decayed, or wounded seamen. The manor of Greenwich was an ancient possession of the crown, and a royal residence as early as the year 1300. It was enlarged by Edward IV., improved by Henry VII. and Henry VIII.; Mary and Elizabeth, daughters of the latter, were born there; and his son Edward VI. closed his life in the same place. It was successively the occasional abode of James I. Charles I. and Charles II. Under William III. the manor and palace, but not the park, were conferred on the establishment for the maintenance of seamen; and in that reign the magnificent hospital was built, on a plan formed by Sir Christopher Wren.

The building consists of four piles detached from each other, but so connected as to form a complete whole, open towards the river, or three sides of a square. The several divisions are occupied either as the residences of the governor or other officers; and there are a hall, a chapel, and apartments for the accommodation of the pensioners. The latter are appropriated for seamen, consisting of a cabin with a single bed, and a long gallery into which each cabin opens, where free air and recreation may be enjoyed. The hall is a magnificent apartment, decorated with exquisite paintings on allegorical subjects connected with naval affairs, by Sir James Thornhill. This establishment has at present upwards of 3000 pensioners, besides between 5000 and 6000 others, called out-pensioners, who receive stipends at various rates. There is connected with it an infirmary, a school for 200 boys, and other institutions, but without he walls. The pensioners are amply supplied with food, re well and uniformly clothed and warmly lodged, and are, esides, supplied with the sailor's almost indispensable lux-ry, tobacco. The whole expense of maintenance is about .26. 10s. a head, but varying with the fluctuation of the rices of bread, meat, and malt. The funds for the support f the institution are in part derived from the rents of the onfiscated Derwentwater estate, but chiefly from sixpence er month deducted from the pay of all seamen, whether mployed in the royal navy or in the merchant service, hich is collected at the custom-houses. All seamen and arines in his majesty's service, and all seamen wounded in e merchant service, are admissible, and are selected by e commissioners.

In the Park of Greenwich is the astronomical observa-ry, inhabited by the astronomer-royal, and well furnished ith appropriate instruments. The office has been filled r a succession of years, from the time of Flamsteed to at of Maskelyne, by some of the most distinguished names the scientific world. The Park of Greenwich is an ob-ct of great attraction, and the hill behind commands a rospect of a most impressive kind over London and the ains of Essex. There are well-supplied markets on Wed-esday and Saturday. The population amounted in 1801 14,339, in 1811 to 16,947, in 1821 to 20,712, and in 31 to 24,553.

GREGARIOUS, amongst zoologists, a term applied to ch animals as do not live solitary, but associate in herds.

GREGORIAN CALENDAR, that which shows the new d full moon, with the time of Easter, and the moveable asts depending thereon, by means of epacts, disposed rough the several months of the Gregorian year. See HRONOLOGY.

GREGORY, surnamed the Great, born at Rome, was de-cended of an illustrious patrician family, and the son of the enator Gordian. He discovered such abilities in the ex-rcise of the senatorial employments, that Justin the young-r appointed him prefect of Rome, and Pelasgius II. sent im as nuncio to Constantinople, to demand succours against e Lombards. When he had thoughts of retiring to en-y a solitary life, he was, in the year 590, elected pope by e clergy, the senate, and the people of Rome, and suc-eeded Pelasgius II. Besides his learning and diligence instructing the church, both by writing and preaching, e had a happy talent in winning over princes in favour of e temporal as well as spiritual interests of religion. He ndertook the conversion of the English, and sent over ome monks, under the direction of Augustin their supe-ior, by whom the seeds of Christianity were first planted this island. His morality with respect to the chastity f churchmen was so rigid, that according to him a man ho had ever known a woman ought not to be admitted to e priesthood; and he always caused the candidates for oly orders to be examined upon that point. He likewise xerted himself most vigorously against such as were found uilty of calumny and other vices. But, notwithstanding l this zeal, he flattered the emperor Phocas, whilst the ands of that prince were yet red with the blood of Mauritius nd his three children, who had been butchered in his sight. e likewise flattered Brunehaut, queen of the Franks, whose haracter was worse than doubtful. He is further accused f having destroyed the monuments of ancient Roman agnificence, that those who visited the eternal city might ot attend to the triumphal arches rather than to holy hings; and burned a multitude of heathen books, includ-g amongst these the History of Livy. He died in 604. f all the popes, he is the one who left the greatest num-er of writings. The best edition of his works is that of aris, 1705, in four vols. folio, published under the auspices f Denis de Sainte-Marthe and Guillaume Bessin of the ongregation of St Maur.

Gregory.

GREGORY of Nazianzen, in Cappadocia, one of the most illustrious ornaments of the Greek church in the fourth century, was born in 328, and having studied at Cæsarea in Palestine, and also at Alexandria, he accompanied his countryman, St Basil, to Athens. He was chosen Bishop of Constantinople in 379; but finding his election contested by the bishops of Egypt, he voluntarily resigned his dignity into the hands of the general council, which had been assembled at Constantinople, in the year 381, and died about the year 389. His works, consisting of a hundred and fifty discourses or sermons, a hundred and fifty-eight poems or pieces in verse, and two hundred and thirty-five letters, the greater part of them interesting, were collected and printed at Bâle in 1550. In the Paris edition of 1609, 1611, in two vols. folio, a Latin version by the Abbé de Belly is printed opposite the Greek text. The Benedictines of the congregation of St Maur commenced a beautiful edition, Greek and Latin, in three vols. folio, of which, however, only one volume was published, Paris, 1788, containing the discourses, with a life of the author compiled from his works.

GREGORY, *Theodorus*, surnamed *Thaumaturgus* or the *Wonder-worker*, on account of his alleged miracles, was the scholar of Origen, and was elected Bishop of Neocæsarea in Pontus, the place of his birth, about the year 240. He assisted at the council of Antioch, in 255, against Paul of Samosata; and died in 270. He had the satisfaction of leaving only seventeen idolators in his diocese, where there were scarcely as many Christians when he was ordained. There are still extant of his, a congratulatory oration to Origen, a canonical epistle, a paraphrase on Ecclesiastes, and some other compositions, which have been published in the collection entitled *SS. Patrum Gregorii Thaumaturgi, Macarii Egyptii, et Basilii Seleuciensis Opera Græco-Latina*, Paris, 1622, in folio.

GREGORY, bishop of Nyssa, one of the Fathers of the Church, and author of the Nicene creed, was born in Cappadocia, about the year 331 or 332. He was chosen bishop of Nyssa in 371 or 372, and banished by the Emperor Valens for adhering to the council of Nice. He was nevertheless afterwards employed by the bishops in several important affairs, and died about the year 396. He wrote Commentaries on the Scriptures, Sermons on the Mysteries, Moral Discourses, Dogmatical Treatises, Panegyrics on the Saints, Letters on Church Discipline, and various works. The Bishop of Nyssa yields to none of the fathers either in the solidity of his matter, the fertility and soundness of his views, the force of his reasoning, or the beauty and richness of his style. Of his works there have been a great number of editions, the principal of which are those of Cologne, 1537; Bâle, 1567 and 1571; Paris, 1573 and 1603, all in folio; also Paris, 1615 and 1618, in two vols. folio, with a third volume by way of appendix, containing various pieces which had not before appeared.

GREGORY of Tours, an illustrious bishop and writer of the sixth century, was descended from a noble family in Auvergne. He was educated by his uncle Saint-Gal, or Gallus, bishop of Clermont; and distinguished himself so much by his learning and virtue, that in 573 he was chosen Bishop of Tours. He afterwards went to Rome to visit the tomb of the apostles, there contracted a friendship with Gregory the Great, and died in 593, at the age of fifty-four. His principal work is his *Historia Francorum*, or History of the Franks, divided into sixteen books, comprehending a period of 174 years from the establishment of the Franks in Gaul. It is written in Latin, which is not only grammatically barbarous, but without force, without expression, and, if we may be allowed the use of the term, without complexion. Gregory of Tours had read the Fathers, and acquired some knowledge of Roman literature; for he cites Virgil and Sallust, Pliny and Aulus Gellius. But the language, formerly so masculine and vigorous, had shared the fate of the civilization of which it was the type, and had fallen into a state of extreme debility and decay. Yet it had in it more of degradation than of barbarism. The Gothic tribes had not yet, by an intimate union, renovated the nations who had degenerated under the shattered yoke of the Roman empire. The victors oppressed the vanquished, without being as yet confounded with them.

Gregory, *David*, the son of the reverend John Gregory, minister of Drumoak, in the county of Aberdeen. He was born about the year 1628, educated by his father for business, and bound as an apprentice to a mercantile house in Holland. But as his love of letters exceeded his desire of money, he relinquished commerce in the year 1655, and upon the death of an elder brother he succeeded to the estate of Kinnardie, about forty miles from Aberdeen, where he resided many years, and had no fewer than thirty-two children born to him by two wives. Three of his sons became eminent for their extensive literature, and were at one time professors of mathematics in the universities of Oxford, Edinburgh, and St Andrews.

In the country where he dwelt he was the first person who had a barometer, to the oscillations of which, according to the changes of the weather, he paid great attention, and was once in danger of being tried by the presbytery for witchcraft or conjuration. He was waited upon by a deputation of ministers, who inquired into the truth of certain reports which had come to their ears; but he so far satisfied them as to induce them to waive a prosecution against a man who, by the extensive knowledge he possessed of medicine, was a public blessing to the country.

About the beginning of the eighteenth century he removed to Aberdeen, and during the wars of Queen Anne's reign, turned his attention to the improvement of artillery, and executed a model of an engine intended to render cannon more destructive. Dr Reid knew a clock-maker who had been employed to make the model of this engine; but as he made many different pieces without knowing their design, or the method of uniting them, he could give no consistent account of the engine. Satisfied with his invention by various experiments, Mr Gregory desired his son to show it to Sir Isaac Newton, but to conceal the name of the inventor; Sir Isaac however was much displeased with it, and declared that the inventor was more entitled to punishment than reward, as it was solely calculated for destruction, and might come to be known to the enemy. That great man urged the necessity of destroying it; and it is probable that Mr Gregory's son, the Savilian professor, followed his advice, for the model was never found.

When the rebellion broke out in 1715, the old gentleman went a second time to Holland; but when the insurrection had been put down, he returned to Aberdeen, where he died about 1720, in the ninety-third year of his age, leaving behind him a history of his own times, which was never published.

Gregory, *James*, one of the most eminent mathematicians of the seventeenth century, was a son of the reverend John Gregory, minister of Drumoak, in the county of Aberdeen, and was born at Aberdeen in 1638. His mother was a daughter of Mr David Anderson of Finzaugh, a gentleman who possessed a singular turn for mathematical and mechanical knowledge. Mathematical genius was indeed hereditary in the family of the Andersons, and from them it seems to have been transmitted to their descendants of the name of Gregory. Alexander Anderson, cousin-german of David Gregory above mentioned, was professor of mathematics at Paris in the beginning of the seventeenth century, and published there, *Supplementum Apollonii Redivivi*, 1612. The mother of James Gregory inherited the genius of her family; and observing in her son, whilst yet a child, a strong propensity to mathematics, she instructed him herself in the elements of that science. He received his education in the languages at the grammar-school of Aberdeen, and went through the usual course of academical studies in the Marischal College.

At the age of twenty-four he published his treatise, entitled *Optica Promota, seu abdita Radiorum Reflexorum et Refractorum mysteria, geometrice enucleata; cui subnectitur appendix subtilissimorum Astronomiæ problematum resolutionem exhibens*, London, 1663: a work of great genius, in which he gave the world an invention of his own, one of the most valuable of modern discoveries, namely, the construction of the reflecting telescope. This discovery immediately attracted the attention of mathematicians, both in our own and in foreign countries, all of whom were soon convinced of its great importance to the sciences of optics and astronomy. As the manner of placing the two specula upon the same axis appeared to Sir Isaac Newton to be attended with the disadvantage of losing the central rays of the larger speculum, he proposed an improvement on the instrument, by giving an oblique position to the smaller speculum, and placing the eye-glass in the side of the tube. But it is worth remarking, that the Newtonian construction of the instrument was abandoned for the original or Gregorian, which is now generally employed where the instrument is of a moderate size; though Sir William Herschel preferred the Newtonian form for the construction of those immense telescopes which he so successfully employed in observing the heavens.

The university of Padua being at this time in high repute for mathematical studies, James Gregory went thither soon after the publication of his first work; and, fixing his residence there for some years, he published, in 1667, *Vera Circuli et Hyperboles Quadratura*, in which he propounded another discovery of his own, the invention of an infinitely converging series for the areas of the circle and hyperbole. To this treatise, when republished in 1668, he added a new work, entitled *Geometriæ Pars Universalis, inserviens quantitatum curvarum transmutationi et mensuræ*, in which he is allowed to have shown, for the first time, a method for the transmutation of curves. These works engaged the notice, and procured the author the correspondence, of the greatest mathematicians of the age, Newton, Huygens, Halley, and Wallis; and as he was soon afterwards chosen a fellow of the Royal Society of London, he contributed to enrich the Philosophical Transactions by many excellent papers. Through this channel, in particular, he carried on a dispute with Huygens, on the occasion of his treatise on the Quadrature of the Circle and Hyperbole, to which that able mathematician had started some objections. It is unnecessary to enter into the particulars of this controversy; but, in the opinion of Leibnitz, who allows Mr Gregory the highest merit for his genius and discoveries, Huygens pointed out considerable deficiencies in the treatise above mentioned, and showed a much simpler method of attaining the end proposed.

In 1688 he published at London another work, entitled *Exercitationes Geometricæ*, which contributed still further to extend his reputation. About this time he was elected professor of mathematics in the university of St Andrews; an office which he held for six years. During his residence there, he married (in 1669) Mary, the daughter of George Jameson, the celebrated painter, whom Mr Walpole has termed the Vandyke of Scotland, and who was a fellow disciple of that great artist in the school of Rubens at Antwerp. In 1674 he was called to Edinburgh to fill the chair of mathematics in that university; but he had held this place for little more than a year, when, in October 1675, being employed in showing the satellites of Jupiter through a telescope to some of his pupils, he was

ddenly struck with total blindness, and died a few days
ter, at the early age of thirty-seven.

GREGORY, *David*, Savilian professor of astronomy at Ox-
rd, and termed by Dr Smith *subtilissimi ingenii mathema-*
us, was the eldest son of Mr Gregory of Kinnardie, bro-
er of the before-mentioned Mr James Gregory. He was
rn at Aberdeen in the year 1661, and received the earlier
rt of his education in that city. He completed his stu-
es at Edinburgh; and, being possessed of the mathema-
cal papers of his uncle, soon distinguished himself as the
ir of his genius. In the twenty-third year of his age he
s elected professor of mathematics in the university of
dinburgh; and published, in the same year, *Exercitatio*
eometrica de dimensione Figurarum, sive specimen methodi
neralis dimetiendi quasvis Figuras, Edinburgh, 1684, 4to.
e early perceived the excellence of the Newtonian phi-
sophy, and had the merit of being the first who intro-
ced it into the schools by his public lectures at Edin-
rgh. "He had already caused several of his scholars
keep acts, as we call them," says Whiston, "upon se-
ral branches of the Newtonian philosophy; while we at
ambridge, poor wretches, were ignominiously studying
e fictitious hypotheses of the Cartesian."

In 1691, on the report of Dr Bernard's intention of re-
gning the Savilian professorship of astronomy at Oxford,
avid Gregory repaired to London; and being patroniz-
d by Sir Isaac Newton, and warmly befriended by Mr
amsteed, the astronomer-royal, he obtained the vacant
ofessorship, for which Dr Halley was a competitor. This
valship, however, instead of animosity, laid the founda-
on of a lasting friendship between these eminent men;
d Halley soon afterwards became the colleague of Gre-
ory, by obtaining the professorship of geometry in the
me university. Soon after his arrival in London, Mr
regory had been elected a fellow of the Royal Society;
d, previously to his election as Savilian professor, he
d the degree of doctor of physic conferred on him by
e university of Oxford.[1]

In 1693 he published, in the Philosophical Transactions,
resolution of the Florentine problem *De Testudine veli-*
rmi quadribili; and he continued to communicate to
e public, from time to time, many ingenious mathema-
cal papers, through the same channel. In 1695 he print-
d at Oxford *Catoptricæ et Dioptricæ Sphericæ Elementa*;
work which, as he informs us in the preface, contains
e substance of some of his public lectures, read, eleven
ears before, at Edinburgh. This valuable treatise was
published first with additions by Dr William Brown,
d the recommendations of Mr Jones and Dr Desagu-
ers; and afterwards by the latter of these gentlemen,
ith an appendix containing an account of the Gregorian
d Newtonian telescopes, together with Mr Hadley's
bles for the construction of both instruments. It is not
worthy of remark, that, at the end of this treatise, there
an observation which shows, that what is generally be-
eved to be a discovery of a much later date, namely, the
nstruction of achromatic telescopes, which Mr Dollond
d Mr Ramsden carried to a high degree of perfection,
d suggested itself to the mind of David Gregory, from
flecting on the admirable contrivance in nature in com-
ning the different humours of the eye. The passage is
follows: "Quod si ob difficultates physicas in speculis idoneis torno elaborandis et poliendis, etiamnum lentibus uti oporteat, fortassis media diversæ densitatis ad lentem objectivam componendam adhibere utile foret, ut a natura factum observamus in oculi fabrica, ubi cristallinus humor (fere ejusdem cum vitro virtutis ad radios lucis refringendos) aqueo et vitreo (aquæ quoad refractionem haud absimilibus) conjungitur, ad imaginem quam distincte fieri poterit, a natura nihil frustra moliente, in oculi fundo depingendam."[2]

Gregory.

In 1702 our author published at Oxford, *Astronomiæ Physicæ et Geometricæ Elementa*, a work which is accounted his masterpiece. It is founded on the Newtonian doctrines, and was esteemed by Sir Isaac Newton himself an excellent explanation and defence of his philosophy. In the following year he gave to the world an edition in folio of the works of Euclid, Greek and Latin, in prosecution of a design, formed by his predecessor Dr Bernard, of printing the works of all the ancient mathematicians. In this work, which contains all the treatises attributed to Euclid, Dr Gregory has been careful to point out such as he found reason to believe, from internal evidence, to be the productions of some inferior geometrician. In prosecution of Dr Bernard's scheme, Dr Gregory soon afterwards engaged with his colleague Halley in the publication of the Conics of Apollonius; but he had proceeded only a little way in this undertaking when, in 1710, he died at Maidenhead, in Berkshire, in the forty-ninth year of his age. To the genius and abilities of David Gregory, the most celebrated mathematicians of the age, Sir Isaac Newton, Dr Halley, and Dr Keill, have borne ample testimony. Indeed it appears that he enjoyed, in a high degree, the confidence and friendship of Sir Isaac Newton. This illustrious philosopher intrusted him with a manuscript copy of his *Principia*, for the purpose of making observations on that work. These observations came too late for the first edition of Newton's great work; but he availed himself of them in the second edition. Besides the works published in his lifetime, he left in manuscript A short Treatise on the Nature and Arithmetic of Logarithms, which is printed at the end of Dr Keill's translation of Commandine's Euclid; and a Treatise of Practical Geometry, which was afterwards translated, and published in 1745, by Mr Maclaurin.

Dr David Gregory married, in 1695, Elizabeth, the daughter of Mr Oliphant of Langtown in Scotland, and by her had four sons, the eldest of whom, David, was appointed regius professor of modern history at Oxford by King George I. and died in 1767, at an advanced age, after enjoying for many years the dignity of dean of Christ Church in that university.

GREGORY, *Dr John*, professor of medicine in the university of Edinburgh, was the son of Dr James Gregory, professor of medicine in King's College, Aberdeen, and grandson of James, the inventor of the Gregorian telescope. His father was married first to Catharine Forbes, daughter of Sir John Forbes of Monymusk, by whom he had six children, most of whom died in infancy; and afterwards to Ann Chalmers, only daughter of the Reverend George Chalmers, principal of King's College, by whom he had two sons and a daughter. John, the youngest of the three, was born at Aberdeen on the 3d of June 1724. Having lost his father when only in the seventh year of

---

[1] On obtaining this professorship, he was succeeded in the mathematical chair at Edinburgh by his brother James, likewise an
ninent mathematician, who held that office for thirty-three years, and when he retired in 1725, was succeeded by the celebrated Mac-
urin. A daughter of this Professor James Gregory, a young lady of great beauty and accomplishments, was the victim of an unfor-
nate attachment, which furnished the subject of Mallet's well-known ballad of William and Margaret. In 1707, another brother,
harles, was appointed by Queen Anne professor of mathematics at St Andrews. This office he held with reputation and ability for
irty-two years; and, on his resignation in 1739, was succeeded by his son, who eminently inherited the talents of his family, and
ed in 1763.

[2] *Catoptricæ et Dioptricæ Sphericæ Elementa*, Oxon. 1695, p. 98.

Gregory.

his age, the care of his education devolved on his grandfather Principal Chalmers, and on his elder brother Dr James Gregory, who, upon the resignation of their father a short time before his death, had been appointed to succeed him in the professorship in King's College. He likewise owed much in his infant years, and indeed during the whole course of his studies, to the care and attention of his cousin, the celebrated Dr Reid, afterwards of the university of Glasgow. The rudiments of his classical education he received at the grammar-school of Aberdeen; and under the eye of his grandfather he completed, in King's College, his studies in the Latin and Greek languages, and in the sciences of ethics, mathematics, and natural philosophy. His master in philosophy and in mathematics was Thomas Gordon, professor of philosophy in King's College, who ably filled an academical chair for above half a century.

In 1742 Mr Gregory went to Edinburgh, where the school of medicine was then rising into that celebrity for which it has since been so remarkably distinguished. Here he attended the anatomical lectures of the elder Dr Monro, of Dr Sinclair on the theory of medicine, and of Dr Rutherford on the practice of physic. He heard likewise the prelections of Dr Alston on the materia medica and botany, and of Dr Plummer on chemistry. The Medical Society of Edinburgh, instituted for the free discussion of all questions relative to medicine and philosophy, had begun to meet in 1737. Of this society we find Mr Gregory a member in 1742, at the time when Dr Mark Akenside, his fellow-student and intimate companion, was a member of the same institution.

In the year 1745 our author went to Leyden, and attended the lectures of Professors Gaubius, Albinus, and Van Royen. Whilst at this university he had the honour of receiving from the King's College of Aberdeen, his *alma mater*, an unsolicited degree of doctor of physic; and soon afterwards, on his return from Holland, he was elected professor of philosophy in the same university. In this capacity he read lectures during the years 1747, 1748, and 1749, on mathematics, experimental philosophy, and ethics. In the end of 1749, however, he resigned his professorship of philosophy, his views being turned chiefly to the practice of physic, with which the duties of this professorship, occupying as they did a great portion of his time, too much interfered. Previously, however, to his settling as a physician at Aberdeen, he went for a few months to the Continent; a tour of which the chief motive was probably amusement, though to a mind like his certainly not without advantage in the enlargement of ideas, and an increased knowledge of mankind.

Some time after his return to Scotland, Dr Gregory married, in 1752, Elizabeth, daughter of William Lord Forbes, a young lady who, to the exterior endowments of great beauty and engaging manners, joined a very superior understanding and an uncommon share of wit. With her he received a handsome addition of fortune; and during the whole period of their union, which was only for the space of nine years, he enjoyed the highest portion of domestic happiness. Of her character it is enough to say, that her husband, in the admired little work, A Father's Legacy to his Daughters, the last proof of his affection for them, declares, that "while he endeavours to point out what they should be, he draws but a very faint and imperfect picture of what their mother was." The field of medical practice at Aberdeen being at that time in a great measure pre-occupied by his elder brother Dr James Gregory, and others of some note in their profession, our author determined to try his fortune in London. Thither accordingly he proceeded in 1754; and being already known by reputation as a man of genius, he found an easy introduction to many persons of distinction, both in the literary and polite world. Amongst these may be mentioned George Lord Lyttleton, who became his friend and patron. An acquaintance, which had been founded on a striking similarity of manners, tastes, and dispositions, grew up into a firm and permanent friendship; and to that nobleman, to whom Dr Gregory was accustomed to communicate all his literary productions, the world is indebted for the publication of the Comparative View of the State and Faculties of Man, which made him first known as an author. Dr Gregory likewise enjoyed the friendship of Edward Montagu and his lady, the celebrated champion of the fame of Shakspeare, against the cavils and calumnies of Voltaire.

In 1754 Dr Gregory was chosen fellow of the Royal Society of London; and as he made daily advances in the public esteem, it is not to be doubted that, had he continued his residence in the metropolis, his professional talents would have found their reward in an extensive practice. But the death of his brother, Dr James Gregory, in November 1755, having occasioned a vacancy in the professorship of physic in King's College, Aberdeen, which he was solicited to fill, he returned to his native country in the beginning of the following year, and took upon him the duties of that office, to which he had been elected in his absence.

Here he remained until the end of the year 1764, when, urged by a laudable ambition, and presuming on the reputation he had acquired as affording a reasonable prospect of success in a more extended field of practice, he changed his place of residence for Edinburgh. His friends in that metropolis had represented to him the situation of the medical school as favourable to his views of filling a chair in that university; and this accordingly he obtained in 1766, on the resignation of Dr Rutherford, professor of the practice of physic. In the same year he had the honour of being appointed first physician to his majesty for Scotland on the death of Dr Whytt.

On his first establishment in the university of Edinburgh, Dr Gregory gave lectures on the practice of physic during the years 1767, 1768, and 1769. Afterwards, by agreement with Dr Cullen, professor of the theory of physic, these two eminent men gave alternate courses on the theory and practice of physic. As a public speaker, Dr Gregory's manner was simple, natural, and animated. Without the graces of oratory, which the subject he had to treat in a great degree precluded, he expressed his ideas with uncommon perspicuity, and in a style happily attempered between the formality of studied composition and the ease of conversation. It was his custom to premeditate, for a short time before entering the college, the subject of his lecture, consulting those authors to whom he had occasion to refer, and marking in short notes the arrangement of his intended discourse; then, fully master of his subject, and confident of his own powers, he trusted to his natural facility of expression to convey those opinions which he had maturely deliberated. The only lectures which he committed fully to writing were those introductory discourses which he read at the beginning of his annual course, and which are published under the title of Lectures on the Duties and Qualifications of a Physician. Of these, which were written with no view to publication, many copies were taken by his pupils, and some from the original manuscript, which he freely lent for their perusal. On hearing that a copy had been offered for sale to a bookseller, it became necessary to anticipate a fraudulent, and perhaps a mutilated publication, by authorizing an impression from a corrected copy, of which he gave the profits to a favourite pupil. These lectures were first published in 1770, and afterwards in an enlarged and more perfect form in 1772.

In the same year, 1772, Dr Gregory published Elements of the Practice of Physic, for the use of Students; a work intended solely for his own pupils, and to be used by himself as a text-book to be commented upon in his course of lectures. In an advertisement prefixed to this work, he signified his intention of comprehending in it the whole series of diseases of which he had treated in his Lectures on the Practice of Physic; but this intention he did not live to accomplish, having brought down the work no further than to the end of the class of Febrile Diseases.

Dr Gregory became early a victim to the gout, which began to show itself at irregular intervals even from the eighteenth year of his age. His mother, from whom he inherited that disease, died suddenly in 1770, whilst sitting at table. Dr Gregory had prognosticated for himself a similar death; an event of which, amongst his friends, he often talked, but had no apprehension of the nearness of its approach. In the beginning of the year 1773, whilst in conversation with his son Dr James Gregory, the latter remarked, that having for the three preceding years had no return of an attack, he might expect a pretty severe shock that season; and he received the observation with some degree of anger, as he felt himself then in his usual state of health. The prediction, however, proved but too true; for having gone to bed on the 9th of February 1773, with no apparent disorder, he was found dead in the morning. His death had been instantaneous, and probably in his sleep; for there was not the smallest discomposure of limb or feature.

Gregory, *Dr James*, professor of the Practice of Medicine in the University of Edinburgh, and eldest son of the subject of the preceding notice, was born at Aberdeen in the year 1753, and there received the rudiments of his education. He accompanied his father to Edinburgh in 1764; and after going through the usual course of literary studies at Edinburgh, was for a short time a student at Christ Church College, Oxford, of which his relation Dr David Gregory had been dean. It was there probably that he acquired that taste for classical learning, and that admiration for the character of an accomplished classical scholar, which ever afterwards distinguished him. He entered early on the study of medicine at Edinburgh, and was a student in that faculty at the time of his father's sudden death, in February 1773. The extraordinary exertion which he then made to complete his father's course of lectures, was regarded by many of his friends as sufficient indication of his ability to continue and extend the hereditary reputation of his family. He took the degree of doctor of physic at Edinburgh in 1774, and spent the greater part of the next two years in Holland, France, and Italy. It is worthy of notice, that his most intimate friend and companion on the Continent was Mr A. Macdonald, afterwards lord chief baron of the Court of Exchequer, in London.

After the death of Dr John Gregory, the chair of the Institutes of Medicine (then finally separated from that of the Practice of Medicine, of which Dr Cullen remained professor) was offered to Dr Drummond, who was at that time abroad, and who ultimately declined accepting it. For two winters the class was taught by Dr Duncan, whose appointment, however, was only temporary. In 1776 the chair was again declared vacant, and on the 1st of August of that year Dr Gregory was appointed professor. He began to lecture on the Institutes the next winter session, and in the succeeding year he commenced also the duty of teacher of Clinical Medicine in the Royal Infirmary, and continued to deliver at least one course of clinical lectures annually, for more than twenty years.

From the time of commencing his duties as professor Dr Gregory was continually engaged in medical practice;, but his practice amongst the higher ranks of society was not extensive until many of his pupils had been settled in business, and were desirous of availing themselves of his assistance. For the last twenty-five years of his life he was much engaged in consulting practice; and for the last ten he was decidedly at the head of his profession in Scotland. Indeed, the boldness, originality, and strength of his intellect, and the energy and decision of his character, were so strongly marked in his conversation, that, wherever his professional character was known, it could hardly fail to inspire general confidence.

In 1778 he published his *Conspectus Medicinæ Theoreticæ*, as a text-book for his lectures on the Institutes. This work passed through several editions, both during his lifetime and since his death, and has been very generally admired, partly on account of the accurate view which it affords of the state of medical science at the period when it was composed, and partly for the ease, perspicuity, and elegance of its Latinity. The greater part of the work is occupied by the principles of Therapeutics; and as it must be confessed that there has been less improvement since that time in the investigation of the powers of remedies, than of the principles either of Physiology or Pathology, that portion of it may still be studied with advantage by all medical men.

On the illness of Dr Cullen in 1790, he was appointed joint-professor of the Practice of Medicine; he became sole professor on the death of Dr Cullen in the same year; and continued to deliver lectures on that subject, to audiences almost regularly increasing, until his last illness in 1821. He died on the 2d of April of that year.

As a practitioner and teacher of medicine, it may be stated that Dr Gregory was chiefly distinguished by his clear perception, and constant application, of the truth contained in a maxim which he was accustomed to quote from a favourite Greek author: "The best physician is he who can distinguish what he can do from what he cannot do." He distrusted all theories in regard to the intimate nature of diseased actions, as premature and visionary; but he had early and carefully studied the diagnostic and prognostic symptoms, and the various forms of the most important diseases, and the agency of the most powerful remedies; and, without entering into the minutiæ of morbid anatomy, he had a clear understanding of the changes of structure to be apprehended from disease in the different internal parts of the body. On these points, and their immediate practical bearing, he fixed all his attention. When he thought that these changes were approaching, and could be arrested by active treatment, he urged the truly effectual remedies with the peculiar energy of his character; restrained only by his strong good sense and ample experience, and despising all parade of nicety, or variety of prescription. When he was satisfied that the nature or the stage of the disease did not admit of effectual cure, his decision of character was equally shown in abstaining from useless interference, and confining his views to the relief of suffering.

As a teacher, he was always strongly impressed with the duty of fixing the attention of his pupils on those points in the history of disease, and in the application of remedies, the knowledge of which he had found by experience to be most practically important, and the ignorance of which he thought practically dangerous. The characteristic symptoms and varieties of inflammatory diseases, and the extent to which the antiphlogistic treatment might be carried in opposing them, were, therefore, subjects on which he dwelt with peculiar earnestness; and in regard to the use of those remedies in such diseases, he had acquired, by long and keen observation, a *tact* and decision which probably were never surpassed. On the other hand, in regard to those numerous chronic diseases, where *remedies* are so frequently ineffectual, he was equally zealous in inculcating those means of *prevention* which he thought most effectual and most attainable; and whilst he was incredulous as to the alleged virtue of most medicines in such diseases, he omitted no opportunity of illustrating the efficacy of temperance, even of abstinence, of bodily exertion without fatigue, and mental occupation without anxiety, in averting their approach, or even arresting their progress. From these great practical objects of his labours as a teacher, no consideration ever turned him aside. His extensive reading, particularly of the older authors, never led to pedantic displays of learning; his logical acuteness never beguiled him into useless controversies; his fertility of imagination never carried him beyond the simplest and most practical views of the subjects of which he treated.

As a lecturer, he possessed the great advantages of a command of language, which made him almost independent of any written notes, and of a tenacity of memory which enabled him to detail cases, in illustration of his principles, year after year, from the whole range of his experience, merely from having the names of the patients before him, without the slightest inaccuracy or omission. The commanding energy and quickness of intellect which his lectures displayed, the frank and fearless exposition of his opinions which they contained, the classical allusions with which they abounded, and the genuine humour by which they were often enlivened, rendered them peculiarly attractive and interesting, and acquired for him a remarkable ascendency over the minds of his pupils.

In the practice of the profession he was remarkable for the frankness and candour of his communications with the relations and friends of the sick; and for the zealous and even tender interest, always increasing with the difficulty and danger of the case, which he took in his patients. This made the more impression, as it contrasted with a certain roughness of external manner, and a constitutional hilarity and whimsical humour, which on some occasions, it must be owned, like that of a celebrated fictitious character, made him "not hesitate between his friend and his joke."

His conduct with his professional brethren in consultation was eminently distinguished by candour and liberality, and the total absence of all professional trick. He never attempted to make himself of importance, but was ever ready to give the strongest commendation to the treatment previously pursued, when he thought it judicious; always laying stress on the great and essential points of practice, and never giving an undue importance to favourite nostrums, or remedies of a secondary or frivolous kind. Thus the young practitioner, who was attentive to his duties, and honourable in his conduct, always found in him a zealous friend; those only had to dread coming into collision with him, who were wanting in professional zeal or professional integrity.

Dr Gregory's more intimate friends and connections were strongly attached to him on account of the warmth and steadiness of his attachments, of a generosity of disposition bordering on profusion, and of a high and somewhat aristocratic sense of honour, which made him instinctively shrink from any proceeding liable to the slightest imputation of meanness, selfishness, or duplicity.

He had therefore an utter detestation for all those professional arts by which the favour of the public is sometimes too successfully propitiated; and this was the true origin of various controversies in which he was at different times engaged with his professional brethren, and to which his strong sense of humour, his fondness for logical disputation, and (it must be confessed) a somewhat irascible temper, led him to devote more of his time and attention than their importance deserved. For the interests of the Medical School, and of the medical profession of Edinburgh, the continuance of these disputes was a matter of serious regret; but the feelings which led him to engage in them were too well understood and appreciated, to permit them to occasion him any loss, either of private friendships or of public estimation.

No medical teacher or practitioner of eminence was ever more ready to acknowledge the imperfection of his art, more distrustful of medical theories, or even of the alleged results of medical practice, when not in accordance with his own experience; or more careless of posthumous reputation. But none was ever more solicitous to give, both to his pupils and his patients, the full benefit of those principles of medical science, of the truth and importance of which he was himself convinced; and on this account his professional character had assumed, long before his death, a superiority over most of his contemporaries, of which those who judge of it only from his own contributions to medical science or literature cannot form an adequate conception.

Dr Gregory used to say, that whilst physic had been the business, metaphysics had been the amusement, of his life. Of this predilection we have a highly honourable testimony, in Dr Reid's Dedication to him and to his illustrious friend Mr Dugald Stewart, of his *Essays on the Intellectual Powers*, published in 1785; and, at a much later period of his life, in the cordial friendship which united him with the late Dr Thomas Brown, and the warm interest which he took in the appointment of that eminent metaphysician to the Chair of Moral Philosophy, on Mr Stewart's resignation of it, and retirement from the University. It is proper to add, however, that on some important metaphysical questions the opinions of Dr Brown were different from those of Dr Gregory, and probably never were the subject of discussion between them.

His own metaphysical and literary works are, *A Theory of the Moods of Verbs*, published in the Edinburgh Philosophical Transactions for 1787; and his *Literary and Philosophical Essays*, in two volumes, published in 1792. The main object of the latter work was to explain and defend a new argument on the old controversy as to the liberty or necessity of human actions; and whatever may be thought of the soundness of the argument, no one has ever disputed the acuteness and power of logical reasoning which he displayed in defence of it. It must be admitted, however, that his ideas of metaphysical inquiry were in some respects limited. He regarded metaphysics rather as a field for syllogistic reasoning, than as a subject of inquiry directed to the establishment of general principles by induction; and one of his favourite doctrines, that metaphysics admit of no *discoveries*, if admitted as literally correct, would almost imply that the study can lead to no useful practical results.

He retained throughout life a fervent admiration for the classical authors, and a severe and somewhat fastidious taste in literature, which was formed on the classical models. Several of the lighter and controversial writings with which he amused himself, particularly his Memorials on certain changes in the arrangements of the Royal Infirmary in 1800 and 1803, exhibit very numerous examples of his ready recollection and happy application of quotations from the classics; and a number of Latin epitaphs and inscriptions of various kinds, which he composed at different periods of his life, attest an accuracy of knowledge of the Latin language, and a purity of taste in Latin composition, which few men have the faculty of retaining throughout a lifetime of incessant professional labour.

Dr Gregory was married in 1782, to Miss Mary Ross; but within a few months after her marriage, this lady, to the extreme regret of all her friends, became decidedly consumptive, and survived only two years. After her death her two sisters continued to reside with their brother-in-law, until they both successively sunk under the same cruel disease. In 1796, he married one of the daughters of the late Mr M'Leod of Geanies, by whom he had a large family. His second son devoted himself with zeal and ability to the profession of medicine. He had entered on practice, had already been placed in several responsible situations in Edinburgh, and distinguished himself by some papers on medical subjects, when he was unfortunately carried off by a fever contracted in the course of his duties, in 1832. But other sons survive, and it is hoped that they may still afford another application of the proud and singularly appropriate motto of the family, *Nec deficit alter.*

(A. A. A. A.)

GREIFFENHAGEN, a circle of the Prussian province of Pomerania, and government of Stettin. It extends over 21 square miles, and comprehends three towns and thirty-four villages, with 19,840 inhabitants. The capital is a city of that name, situated on a branch of the river Oder. It contains 4150 inhabitants, depending chiefly on agriculture, on brewing, tanning, and distilling, and some trade by the river.

GREIFSWALDE, a city of Prussia, capital of a circle of the same name, in the province of Pomerania. It is situated on an arm of the sea, is fortified, and has pleasant public walks. It is the seat of a university, well endowed, but not much frequented by students. It contains 8 houses, and 7970 inhabitants, who are engaged in refining salt and sugar, ship-building, and foreign trade. The larger ships anchor below the city, at Wyk. Long. 13. 46. 25. E. Lat. 54. 4. 35. N.

GREISBACH, a bailiwick of the circle of the Lower Danube, in the kingdom of Bavaria, extending over 308 square miles. It contains four market-towns, 146 villages, and 660 hamlets, with 27,870 inhabitants. It is one of the best cultivated districts in the kingdom. The chief town, of the same name, contains only 840 inhabitants.

GREIZ, a city, the capital of the principality of Reuss, of the elder branch. It is surrounded with walls, and contains 566 houses, with 6195 inhabitants. The palace of the prince is on a hill adjoining the city, with a fine ornamental garden and orangery.

GRENADA, an island in the West Indies, situated between the parallels of 12. 20. and 11. 58. N. lat., and 61. 20. and 61. 35. W. long. It was discovered in the year 1498, by Christopher Columbus, who found it possessed by a numerous and warlike people, from whom, however, the Spaniards were attracted by the nobler prize which they had to contend for upon the American continent. The Charaibes remained in peaceful possession of their territory until the year 1650, when Du Parquet, the French governor of Martinique, sent out an expedition, consisting of 200 adventurers, to take possession of it. This they finally effected, first by treachery, and then upon the principle of wholesale extirpation. The inhabitants were divested of their property by a fictitious purchase, and refusing to surrender their natural heritage for a few knives, glass-beads, and other trinkets, a war ensued, which ended in the extermination of the natives. The colony, however, underwent a series of revolutions and calamities, but the result was the establishment of the authority of Du Parquet and his lieutenant. In a few years, however, the island became vested in the crown of France, after the colonists had severely suffered from the cruelty and rapacity of an insolent governor. For many years the colony remained in a state of poverty and depression; and the Abbé Raynal informs us that, in 1700, the island contained no more than 251 whites and 525 blacks, who were employed on three plantations of sugar, and fifty-two of indigo. Grenada surrendered on capitulation to Great Britain in 1762, to which country it was finally ceded by the definitive treaty of peace which took place in the year following. The island having become a British colony, certain stipulations were made in favour of the inhabitants; but it does not seem to have prospered; and it was retaken by the French in 1779. By the general pacification which took place in January 1783, it was restored to Great Britain, to which it has ever since been attached, although the French, during an insurrection of the slaves, which took place towards the close of the last century, attempted again to obtain possession of it. Grenada is computed to be about twenty-five miles in length, and twelve miles in breadth at the centre, but it gradually narrows towards either extremity. It contains about 80,000 acres of land, but the quantity actually under cultivation has never exceeded 60,000. The general aspect of Grenada is extremely lonely, but mountainous and picturesque. The interior and north-west coast consist of continuous ridges of hills, rounded in their outline, and clothed with vast forest trees and brushwood. An irregular range of mountains runs across the island from north to south, which in some parts has an elevation of 3000 feet above the level of the sea. From this main chain several lesser ridges strike off, forming rich and picturesque valleys. The island is in general very fertile and well cultivated.

With regard to the geology of Grenada, a regular definition of the stratification can scarcely be given, on account of the country being rugged and abrupt. The great mass of the mountains consist of sandstone, greywacke, hornblende, and argillaceous schist. The animals of Grenada are few and uninteresting to the naturalist. The medium temperature throughout the year is estimated at eighty-two degrees of Fahrenheit in the low country, but in the more elevated parts it is of course lower. A considerable quantity of rain falls, and throughout the year showers descend. Hurricanes are comparatively mild and infrequent, but shocks of earthquakes are sometimes experienced. Of late years the climate has been materially improved. Grenada is watered by rivers and fresh-water springs, which derive their source from a lake called the Grand Etang, which is situated near the centre of the island, at an elevation of 1740 feet, amidst mountain scenery. Along the coast are numerous safe and handsome bays and harbours. The chief products are sugar, cocoa, coffee, and cotton; indigo and tobacco are also raised, together with luxuriant crops of fruits and vegetables, which here grow in great abundance, and arrive at high perfection. The waters abound with fish, and there is also a profusion of wild game. The island is divided into six parishes, St Patrick, St Andrew, St John, St Mark, St David, and St George. In the last of these is situated the capital, St George, or George Town, which is built upon a peninsula projecting into a spacious bay on the west or lee side of the island, not far from the southern extremity. It is embosomed in an amphitheatre of hills, and chiefly situated on elevations which rise from the bay; the consequence is, that the streets are steep. The houses are well built, and on the whole the town has a handsome appearance. It is divided by a ridge, which, running into the sea, forms on one side what is termed the Carenage, which is a large basin of water, surrounded by wharfs, and in the vicinity of which the principal merchants reside. In this carenage the ships lie landlocked, and in deep water, close to the wharfs. The entrance is defended by a citadel called Fort George, which is built upon a rocky eminence. On the left the land rises gradually to some height, on which elevation the fortifications of Hospital Hill are erected, and a long ridge, which falls towards the middle, connects this fort with Richmond heights, which constitute the background of the scene, and which are also fortified. The ridge which connects Fort George with Hospital Hill also divides the carenage from the larger portion of the town, which contains the market-place, and looks upon the bay. Upon this hill are built some of the principal houses, the church, and the parsonage. At its extremity is the court-house, and, nearly opposite, the Catholic chapel. Besides the carenage, there is another spacious sheet of water, called the Lagoon, which is separated from the former by a reef passable only in boats. This of itself would constitute an excellent harbour, and it was at one time contemplated to join the two, but this has never been effected. The public buildings of George Town are the court-house, which is a fine building, provided with every necessary accommodation; the jail, which is of considerable dimensions, having a yard and tread-mill; the church, a handsome building, with a spire and clock; the Roman Catholic chapel, the Methodist meeting-house, the custom-house, and the offices of the secretary and treasurer. The market-place is a square piece of ground of considerable dimensions, surrounded by houses irregularly built. The other towns of Grenada are, properly speaking, only inconsiderable villages or hamlets, which are generally situated at the bays or shipping places.

Between St Vincent and Grenada there is a cluster of islands called Grenadines, some of which are dependencies of Grenada. Of these, Cariacou is the most important. It constitutes a parish containing 6913 acres of land, and is about nineteen miles in circumference. It is fertile and well cultivated, but it suffers from drought. Cotton was formerly the chief article of cultivation, but sugar is the staple article now raised. In a good season the average produce is upwards of 2,000,000 lbs. The chief town is called Hillsborough: it contains a church and rectory.

The following return shows the different products of Grenada and the Grenadines in 1830: Sugar, 22,100,953 pounds; rum, 890,434 gallons; molasses, 255,679 gallons; coffee, 26,122 pounds; cocoa, 337,903 pounds; cotton, 97,804 pounds. The following is an account of the quantities of the three great articles, sugar, coffee, and rum, imported from Grenada into the united kingdom, in the year 1832: Sugar, 188,231 hundredweights, 1 quarter, 14 pounds; coffee, 8749 pounds; rum, 103,654 proof gallons. The official value of the imports into the united kingdom from Grenada was, in 1806, L.509,010; in 1823, L.387,546; and in 1831, L.303,906. The declared value of British and Irish produce and manufactures exported from the united kingdom to Grenada was, in 1823, L.67,792, and in 1831, L.68,377. The number and tonnage of vessels to and from the united kingdom and Grenada, for the years 1823 and 1831, were as follow:

INWARDS.				OUTWARDS.			
1823.		1831.		1823.		1831.	
Ships.	Tons.	Ships.	Tons.	Ships.	Tons.	Ships.	Tons.
36	11,206	37	11,093	33	10,189	37	10,766

In 1824 the population of Grenada and the Grenadines amounted to 29,648, and in 1832 to 28,439.

GRENAILLE, a name given by the French writers to a preparation of copper, which the Chinese use as a red colour in some of their finest china, particularly for that colour which is called *oil red* or *red in oil*.

GRENOBLE, an arrondissement of the department of the Isère, in France, extending over 1320 square miles. It is divided into twenty cantons, and 217 communes, and contains 177,690 inhabitants. The capital is the city of the same name, situated near the Rachet Mountains, on a beautiful plain, which is watered by the river Isère, after it has been increased by the stream of the Drac. It is surrounded by walls and ditches, and defended by a citadel, which serves the purpose of an arsenal. The cathedral, the episcopal palace, the hall of justice, and the great hospital, are the principal buildings. There is an academy with the power of conferring degrees; a public library of 60,000 volumes; a botanic garden; a museum of natural history, antiquities, and medals; and other establishments appropriate to the purposes of medical, legal, and military education. There are several manufactures carried on in the city. That of gloves, for which it was long celebrated, has fallen off, but still employs many persons. Watchmaking is another employment for a number of persons, who annually make about 10,000 watches. There are, besides, cotton and linen spinning and weaving, with distilleries for brandy, ratafia, and other liqueurs. It has some beautiful public walks near the city. The houses amount to 2406, and the inhabitants to 22,149. Long. 5. 38. 19. E. Lat. 45. 11. 42. N.

GRENVILLE, the Right Honourable WILLIAM WYNDHAM, LORD, one of the most distinguished statesmen of his time, was born on the 25th of October 1759. He was the third son of the Right Honourable George Grenville, prime minister of England in 1763, 1764, and 1765, and of Elizabeth, daughter of Sir William Wyndham, baronet, by Lady Catherine Seymour, and sister of Charles, first earl of Egremont. He received his early education at Eton, where, it seems, he was concerned in the grand rebellion under Foster, when the boys left the school in a body, threw their books into the Thames, and marched to Salt Hill. The young mutineer was, however, persuaded by his father to return; but in a few weeks, it became evident that this act of insubordination had rendered it inexpedient that he should remain longer at the school where it had occurred, and he was in consequence removed to Christ-Church College, Oxford. Here, however, he soon distinguished himself, and, in 1779, gained the chancellor's prize for a composition, in Latin verse, on the subject of the *Vis Electrica*. Having taken his bachelor's degree, he entered himself at one of the inns of court, with the view of qualifying for the bar; but his attention was quickly diverted from the study of law, which few men prosecute from mere inclination, to the more attractive and exciting business of politics. In February 1782 he was, upon a vacancy, returned to parliament for Buckingham; and in the September following, when his brother Earl Temple, afterwards Marquis of Buckingham, was sent to Ireland as lord lieutenant, Mr Grenville accompanied him as private secretary, and was sworn in as a privy councillor of that kingdom. The period of Earl Temple's vice-regal government terminated in June 1783; but in the December ensuing, Mr Grenville accepted office at home, where he was appointed to succeed Mr Burke as paymaster of the army. From this appointment we may date the commencement of his active senatorial career; whilst his industry and acquirements, added to strong natural talents, soon rendered him of consequence in the House of Commons. He became an able coadjutor of Mr Pitt, his cousin-german, who was only a few months his senior. Firm at his post, inflexible in his determination, and retaining in debate the full possession of all his faculties, the youthful minister could scarcely have had a more zealous, active, efficient, and congenial colleague, or one better qualified to perform well the part assigned him, and to promote the views of government, whilst he advanced his own reputation. That he wanted the stately and commanding eloquence of his distinguished relative, may be admitted without any injury to his senatorial character; but, on the other hand, if he could not contend with Mr Pitt in oratorical power and dignity, he far excelled that minister in minuteness of knowledge and accuracy of detail. To Mr Grenville, indeed, the routine of office was almost hereditary: he seemed to have imbibed all the peculiar ideas and methodical habits of his father, even though he was only a boy at the death of that persevering but not very fortunate or popular statesman.

At the general election of 1784, when Mr Pitt had recourse to the bold expedient of a dissolution, he was chosen one of the representatives of the county of Buckingham, after as vigorous and severe a contest as had ever been known; and, in 1790, he was re-elected without opposition. Mr Grenville had scarcely completed his thirtieth ycar when he was appointed to preside over the House of Commons. This event took place on the 5th of January 1789, when he was elected Speaker, on the death of the Right Honourable Charles Wolfran Cornwall. But before four months had elapsed, he was called from the distinguished station to which he had thus been advanced, to fill the more responsible though not more arduous or honourable office of secretary of state for the home department. This was followed by his removal to the House of Lords in virtue of a patent of nobility, dated the 25th of November 1790; and thenceforward he became at once the representative and the echo (*alter ego*) of Mr Pitt in the upper house. But in May 1791, he exchanged the seals of the home for those of the foreign department, which he retained until the resignation of Mr Pitt in February 1801. In the same year, he was also appointed ranger of St James's and of Hyde Park, a post which he held till 1795, when he exchanged it for the lucrative office, or rather sinecure, of auditor of the exchequer. Lord Grenville filled the important office of foreign secretary with equal talent and industry during one of the most arduous periods of British history. For this situation, indeed, both his natural powcrs and his acquired knowledge eminently fitted him. He was skilled in the details of European politics; he had studied, though perhaps not very profoundly, the law of nations; he was well acquainted with modern languages; he could endure the fatigue of prolonged application; and the pursuit of pleasure, if at all indulged in, never interrupted his attention to the duties of his office. He loved business, as his father did, for its own sake; it was to him not so much an instrument of ambition, as a source of amusement; his active mind sought, because it required, continual employment; and neither the pleasures of literature nor the gaieties of society could seduce him from his post. In him there was nothing to dissipate his ideas or to divert his attention, and hence he was able to bring his mind to bear in all its force on the subject before him.

Of these, by far the most important, both in its immediate results and in its remoter consequences, was the state of the relations between Great Britain and France, and the fearful question of peace or war which at length arose out of the mighty convulsion which had taken place in the latter country. Sternly adverse to the principles of which the French Revolution seemed to be merely the practical expression, and apprehensive of the diffusion of the same spirit in this country which had sapped the foundations of the monarchy in the neighbouring kingdom, Lord Grenville appears to have been early prepared to oppose, not a defensive resistance, but an active and armed hostility, to the new order of kings which the Revolution had established in France. Regarding these changes with more perhaps of passion than of political sagacity, with the feelings of an alarmist rather than the cool dispassionate consideration of a statesman, and scared by the apparent magnitude of the danger, viewed as it was by him through an exaggerating medium, he conceived that the opinions which he dreaded could only be controlled or repressed by force, and he contributed his full share to plunge his country into a war which prudence might have avoided, and which no overruling necessity imposed. Hence, in his whole bearing and deportment towards the revolutionary government of France, he displayed a degree of haughtiness, and, in his communications with the French authorities, indulged in a severity of language, which, being marked with all the characters of public defiance and insult, could not fail to provoke hostility in return, and, in fact, accelerated, if they did not actually produce, the war which soon afterwards followed. In his correspondence with M. Chauvelin, who had been the French ambassador at the court of London previously to the death of Louis XVI., and who claimed to be still recognised in the same capacity, even after that unfortunate monarch had lost his life, Lord Grenville threw aside the ordinary language of diplomacy, and, in his letters, gave way to a bitterness of retort, unexampled perhaps in the intercourse of great nations, and thus afforded to M. de Talleyrand, then acting as the political Mentor of Chauvelin, an opportunity of which he did not fail to take advantage, for throwing upon the government of Britain the discredit of being the first to unsheath the sword in a war of opinion. Of the tone and temper of this extraordinary correspondence some idea may be formed from the following communication, ordering the immediate departure from this realm of the representative of the French government:—

"I am charged to notify to you, sir, that the character with which you had been invested at this court, and the functions of which have been so long suspended, being now entirely terminated by the fatal death of his most Christian majesty, you have no longer any public character here. The king can no longer, after such an event, permit your residence here. His majesty has thought fit to order that you should retire from this kingdom within the term of eight days; and I herewith transmit you a copy of the order which his majesty, in his privy council, has given to this effect. I send you a passport for yourself and your suite; and I shall not fail to take all the other necessary steps in order that you may return to France with all the attentions which are due to the character of minister plenipotentiary from his most Christian majesty, which you have exercised at this court."

Notwithstanding this insulting dismission of its accredited representative, the French government immediately dispatched M. Maret, afterwards (under the imperial regime) Duke of Bassano, to endeavour to resume negotiations, and, if possible, to induce this country to remain neutral; but so determined was Lord Grenville not to allow the least opening towards an accommodation, or, in other words, to push matters to extremity, that he persisted in refusing permission to the French envoy to proceed beyond Dover, contrary, as was generally thought at the time, to the opinion of Mr Pitt. The precise amount of responsibility to his country and to posterity which he incurred, in thus cutting off the last chance of peace, and urging the nations of Europe into a sanguinary contest of twenty years' duration, it is not for us to determine. He will be judged at the impartial tribunal of history, when the men of this age, who have been more or less influenced by its prevailing opinions, feelings, prejudices, or animosities, shall have been gathered to the countless generations that went before them, and when the verdict cannot be affected by any of those causes of error which insensibly influence and pervert contemporary judgments.

In 1795, Lord Grenville had an opportunity of displaying at once his loyalty and his talents as an orator, on the occasion of the attack which had been made upon the king, George III. whilst proceeding to the House of Lords to open the session of parliament. He brought in a bill to provide for the due protection and safety of the royal person; and as this measure gave rise to a protracted and stormy debate, it afforded his lordship ample scope for the most loyal exertion of his rhetorical powers. As the war party were then in the ascendant, Lord Grenville had the satisfaction of finding himself supported by a large majority; and therefore he followed up his success by bringing in another bill to suppress seditious societies, and prevent the formation of any such in future. Associations having it for their object to promote a reform in the representation of the people in parliament were then considered as seditious, and proscribed accordingly. Lord Grenville actively co-operated with Mr Pitt in carrying through the union with Ireland, and also united with him in giving to the Irish Catholics those assurances which mainly contributed to the success of the measure, and on which the powerful body in question afterwards founded a direct claim to emancipation. But these two ministers soon discovered that they had promised more than they were able to perform. The king entertained religious scruples which it was found impossible to overcome; their colleagues, supported by all the prejudice and bigotry of the time, took the same view of the matter with his majesty; and the public mind was not yet prepared for that great act of national justice which the Irish Catholics had been led to expect at their hands. Besides, it had become indispensably necessary to make peace with revolutionary France, which had triumphed over the coalitions formed against her under the auspices of Mr Pitt, and had established republican institutions on the basis of victory. In these circumstances, the Pitt ministry resigned, and was succeeded by that of Mr Addington, afterwards Lord Sidmouth, which concluded the short-lived peace, or rather armistice, of Amiens. But as the new administration rested on no solid foundation, and moreover occupied an anomalous position, application was soon afterwards made to Mr Pitt to join the parties then in power. He refused to accede to this proposal, however, unless Lord Grenville were included in the arrangement; and as this condition was rejected, the negotiation proved fruitless. Meanwhile, the incapacity and weakness of the Addington administration became every day more apparent; and as the king entertained the strongest disinclination towards Mr Fox and his party, no long time elapsed before Mr Pitt found himself obliged to yield to the urgent necessities of the state, and resume office. In May 1804, he again took his seat as first lord of the treasury, but without having stipulated for Catholic emancipation, to which he was understood to have been distinctly pledged. Lord Grenville and Mr Windham accordingly refused to join him; and from this time until Mr Pitt's death, his lordship took a prominent part in the ranks of opposition.

On the demise of Mr Pitt was formed that short-lived administration which, though intended to combine "all the talents," and thereby to unite all the means of good government, has been ridiculed by some political writers as anomalous, visionary, impracticable, and stigmatized by others as monstrous and disgraceful. Of this ministry Lord Grenville, who had joined the Whigs in 1804, was placed at the head; whilst Mr Fox, whose thoughts were bent on endeavouring, if possible, to bring about a peace, reserved to himself the situation of foreign secretary, as best suited to the pacific views with which he was animated. The junction of these eminent statesmen in 1804, and afterwards in office, seems to have been dictated by their agreement on some great questions, and their disposition to sacrifice lesser differences of opinion, and all personal considerations, to the important object of advancing those grand principles in which they coincided. But still there were various differences of principle amongst the members of this administration; for not only were Whig and Tory, alarmist and reformer, to coalesce, but during the war, and for the sake of carrying it on towards a better issue, they who were the authors of it were united with its constant and sturdy opponents. Yet some of the wisest men of the time approved of the union, because lesser things should yield to greater; and upon one or two great questions there was a fortunate concurrence of opinion. But there were others who thought differently, and by them its failure was of course ascribed to the heterogeneous and discordant elements included in the attempted union. An important obstacle to its duration, however, was created by the religious prejudices of the monarch, directly opposed as they were to the measure of relief which Lord Grenville considered himself as pledged to bring forward; and, independently of other causes, a party equally zealous with the sovereign in their resistance to the Catholic claims proved too powerful for the continuance in office of a ministry resolved at all hazards to attempt the removal of the disabilities affecting persons of the Roman Catholic persuasion both in Great Britain and in Ireland. The Grenville administration was, accordingly, dismissed, after having been in office only during the short period of thirteen months. We may add here, that Lord Grenville suffered not a little in his popularity by obtaining an act of parliament to enable him to hold, along with the premiership, the profitable but nearly sinecure office of auditor of the exchequer, which had been conferred on him by his kinsman Mr Pitt in 1795, and which he retained until the time of his death.

After the breaking up of this administration, Lord Grenville did not accept of any prominent office in the state. In 1812, when the resignation of Lord Castlereagh and Mr Canning left Lord Liverpool the only secretary of state, performing the business of the three departments, official letters were addressed to Earl Grey and to his lordship, proposing the immediate formation of a combined administration; but nothing came of this advance towards a coalition of parties. Earl Grey and Lord Grenville were both in the country when these communications reached them. The former at once declined all connection with Mr Percival and Lord Liverpool, and therefore did not proceed to town. The latter, who was in Cornwall, set out for London immediately on receipt of the communication which had been addressed to him; but the day after his arrival he declined the proposed alliance, on the ground of his inability to view it in any other light than that of a dereliction of principle. This appears to have been the last tender of office made to his lordship. He continued in opposition to the government during the war; but upon the final defeat of the French in 1814, he congratulated the country on the prospect of peace, and, in the following year, supported ministers in their resolution to depose, if not to outlaw, Napoleon. From this time he ceased to take so prominent a part as he had previously done in parliamentary discussions; but, on important occasions, he came forth with all his wonted vigour, and sometimes, we regret to add, threw the whole weight of his talents and authority into the scale in favour of principles which could scarcely have been expected to receive his countenance and support. In a speech which he delivered, in the House of Lords, upon the 30th November 1819, on the Marquis of Lansdowne's motion for an inquiry into the state of the country, and more particularly into the distress and discontents of the manufacturing districts, he came forth in the character of an alarmist, and, mistaking the discontent arising from severe suffering for the indication of a revolutionary spirit, proposed as the only fitting remedy for the evil an increased restraint on the liberties of the people. The language employed by Lord Grenville on this occasion is no doubt expressive of sincere conviction; but the natural strength of his understanding was unhappily paralysed by panic, and the arguments of the speech are not grounded on facts, but on what he is pleased to term "universal notoriety," whilst the documents produced contradict most of his positions. The ministry of the day, however, were fortunate in obtaining the sanction and co-operation of a statesman like Lord Grenville; and, as his speech on Lord Lansdowne's motion was printed and extensively circulated, they were thereby enabled to reap the full benefit of his support.

Towards the close of the year 1809 Lord Grenville was chosen as chancellor of the university of Oxford. His predecessor, the Duke of Portland, having died on the 30th of October in that year, the candidates who appeared in the field, besides his lordship, were the Duke of

Grenville.

eaufort and Lord Eldon. The election commenced on ie morning of the 13th December; and on the evening f the 14th, when it closed, the numbers declared were, r Lord Grenville 406, for Lord Eldon 303, and for the uke of Beaufort 238, giving a majority for Lord Grenlle of 103. The number of persons entitled to vote mounted to 1282, of whom 1037 polled on this occasion. ome days after his election, his lordship received by dioma the honorary degree of doctor of civil law; and his stallation as chancellor took place on the 3d of January 810.

Lord Grenville was a man of very considerable attainents both in literature and in political science. In 1804 e edited the letters which had been written by the first arl of Chatham to his nephew, Thomas Pitt, afterwards ord Camelford, when at Cambridge. He enriched an lition of Homer, privately printed, with valuable annotions; he translated into Latin several pieces from the reek, the English, and the Italian, which were circulated mongst his friends under the title of *Nugæ Metricæ;* nd, in a pamphlet, he defended his alma mater against e charge of having expelled from her learned prencts the illustrious author of the Essay on Human Unerstanding. Besides several speeches and other lesser ompositions, Lord Grenville also published, 1. A New lan of Finance, as presented to Parliament, with the ables, 1806; 2. A Letter to the Earl of Fingal, 1810; On the supposed direct Advantages of the Sinking und, 1828. This last publication, forming the first part a general Essay on the Sinking Fund, which his lordip, however, did not afterwards complete, is in several spects a remarkable production, and in none more than this, that it contains a manly and statesmanlike avowal a change of views, on the part of the author, regarding e important subject of which it treats. In the preface, ter stating that the portion submitted to the public conins only one part of the essay which had been intended r publication, and that severe illness had stopped the ogress and prevented the completion of his design, his rdship goes on to say: "Under these circumstances, it s not been without much hesitation that I have deterined to lay before the public this portion of a work in respects so very imperfect. I should certainly not ve done so had I consulted only the feelings of an auor. But my original purpose was of a far higher order. was directed to the hope of contributing what might practically useful in a discussion of very urgent intest, and great permanent importance to our country...... is, however, just that I should here distinctly avow, at I have availed myself, without reserve, of the lights hich have been thrown upon this subject by many wrirs of the present age, to whose praise nothing could be ded by my enumeration of them. And I am particuly bound to acknowledge, that it was by the well-known eatise of Dr Hamilton that my thoughts on this matter re, I believe, first directed into their present channel. t I am not aware that the question has ever yet been ced before the public exactly in the same point of view which I have here considered it; and with respect to e distinguished writer whom I have named, there are t a few of the topics on which I have most dwelt, and me others which I have not had occasion particularly notice, respecting which his opinions, if I rightly apehend them, differ, I regret to say it, very much from mine." He adds, that, throughout the inquiry, he has not scrupled to question many long-established and deeply-rooted prepossessions; that truth alone is his object; and that without the free examination of previously received opinion, no branch of human knowledge can ever be advanced. In short, his lordship surrenders as unfounded and fallacious the principle upon which the act of 1786, establishing the sinking fund, was established; and, though he is anxious to guard himself against any imputation of injustice towards the authors of that measure, he nevertheless shows that the views by which they were guided are erroneous, that the only real sinking fund is that which is supported by a surplus revenue, that the effective operations of Mr Pitt's fund were supported only by surplus taxation, that the reductions of debt thus effected are mere exchanges of equivalents, and that these results were in no degree varied by the application of compound interest to the operations of this fund.

Although Lord Grenville was the contemporary of some of the greatest men that have ever adorned this country, yet his talents were not eclipsed in their presence. As a statesman he was remarkable for boldness and perseverance, two qualities which are rarely united; and, though on some subjects he entertained narrow or prejudiced notions, on others he displayed enlarged conceptions combined with sound practical views. As a speaker, he was perhaps one of the most powerful debaters that ever appeared in the House of Lords. There was a commanding energy in his delivery, as well as in his style, which never failed to arrest the attention, and often succeeded in gaining the admiration, even of those who differed from him in opinion. It has been said of him that no orator, perhaps, ever produced so strong an impression by his manner during the first ten minutes of his speech; but the want of variety was a defect which, after a time, began to be perceived, and which in the course of a long address seldom failed to impress itself rather painfully on his hearers. As he always took care to prepare himself on every subject on which he spoke, his speeches were full of matter, and, if deficient in flexibility, he never wanted information. He possessed not the animation, the acuteness, and the indignant sarcasm of Lord Grey; but during a long period he was considered as second only to that noble person as an effective speaker in the Upper House; and, after the year 1804, they were associated as the heads of the opposition, with whom negotiations were carried on during several emergencies, when it became either necessary or politic to make overtures with a view to the formation of a new ministry.

On withdrawing from his parliamentary duties, Lord Grenville spent the evening of a long and active life at his seat of Dropmore, in Buckinghamshire, where he solaced his retirement with the pursuits of elegant literature, and died on the 12th of January 1834, in the seventy-fifth year of his age. Lord Grenville married, on the 18th of July 1792, the Honourable Anne Pitt, only daughter of Thomas, the first Lord Camelford, and sister and sole heiress of the second lord, who was killed in a duel with Mr Best in 1804; but as he left no issue, the barony of Grenville has in consequence become extinct.[1] (A.)

GRESHAM, Sir Thomas, an opulent merchant of London, descended from an ancient and honourable family of Norfolk, was born in 1519. He was, as his father had been before him, appointed king's agent at Antwerp,

---

It has often been said that the secret of the authorship of *Junius*, which is supposed to have been deposited in the shelves of the rary at Stowe, would be disclosed after the death of Lord Grenville, when, as was alleged, there would no longer be any reason for hholding the revelation from the world; and it has further been presumed, that to his nephew, Lord Nugent, would probably be fided the agreeable task of satisfying the public curiosity on this much-agitated question. We understand from good authority, wever, that there is no foundation for this surmise, and that the authorship of the celebrated letters bearing the signature of Junius kely to remain as great a mystery as ever.

Greville.

and in 1551 he removed to that city with his family. This employment was suspended on the accession of Queen Mary; but on a proper representation being made in his favour, it was restored to him. Queen Elizabeth conferred the honour of knighthood upon him, and appointed him her agent in foreign parts. About this time he thought of providing himself in the city with a mansion-house, suited to his station and dignity; and with this view he built a large house on the west side of Bishopsgate Street, afterwards known by the name of *Gresham College.* His father had proposed building a house or exchange for the merchants to meet in, instead of walking in the open street; but this design it was reserved for the son to execute. Sir Thomas in fact went beyond his father. He offered, if the citizens would provide a proper piece of ground, to build a house at his own expense; and this offer being accepted, he fulfilled his promise, and built an exchange upon the plan of that at Antwerp. When the new edifice was opened, the queen, on the 29th of January 1570, came and dined with the founder, and caused a herald with a trumpet to proclaim it by the name of the *Royal Exchange.* In pursuance also of a promise to endow a college for the profession of the seven liberal sciences, he by a testamentary disposition bequeathed his house in London for that purpose; leaving one moiety of the Royal Exchange to the corporation of London, and the other to the mercers' company, for the salaries of seven lecturers in divinity, law, physic, astronomy, geometry, music, and rhetoric, at L.50 per annum each. He left several other considerable benefactions, and died in 1579. As to the college, it was afterwards pulled down in consequence of an application to parliament from the city, and the excise office erected in its stead. The lectures are read, or rather hurried through, in a chamber over the Royal Exchange. Sir Thomas Gresham had the happiness of a mind every way suited to his fortune; he was generous and benign; ready to perform any good action, and to encourage the same disposition in others. He was a great friend and patron of John Fox the martyrologist. He was acquainted with the ancient and several of the modern languages; he had a comprehensive knowledge of all affairs relating to commerce, whether foreign or domestic; and his success as a merchant was proportioned to his general attainments, for in his time he was esteemed the highest commoner in England. He transacted Queen Elizabeth's mercantile affairs so constantly, that he was called *the royal merchant;* and his house was sometimes appointed for the reception of foreign princes upon their arrival in London.

GREVILLE, Fulke, Lord Brooke, a poet and miscellaneous writer, was born in the year 1554, and descended from the noble families of Beauchamps of Powick and Willoughby de Brooke. In company with his cousin Sir Philip Sidney, he began his education at a school in Shrewsbury; whence he went to Oxford, where he remained for some time as a gentleman commoner, and then removed to Trinity College, Cambridge. Having left the university, he visited foreign courts, and thus to his knowledge of the ancient languages added an acquaintance with the modern. On his return to England he was introduced to Queen Elizabeth by his uncle Robert Greville, at that time in her majesty's service; and by means of Sir Henry Sidney, lord president of Wales, he was nominated to some lucrative employments in that principality.

On the accession of King James I. he was installed knight of the bath; and soon afterwards obtained a grant of the ruinous castle of Warwick, which he repaired at a considerable expense, and where he probably resided during the earlier part of this reign. In the year 1614, he was made under-treasurer and chancellor of the exchequer, a member of the privy-council, and gentleman of the bed-chamber; and in 1620 he was raised to the dignity of baron by the style and title of Lord Brooke of Beauchamp's Court. He was also privy-councillor to King Charles I., in the beginning of whose reign he founded an historical lecture in Cambridge. Having thus attained the age of seventy-four, through a life of continued prosperity, and being universally admired as a gentleman and a scholar, he fell by the hand of an assassin, one of his own domestics, who immediately stabbed himself with the same weapon with which he had murdered his master. Notwithstanding Lord Orford's flippant and depreciatory estimate of Lord Brooke's talents, he appears to have cherished a taste for polite learning, particularly for poetry and history. His principal works are, 1. The Life of the renowned Sir Philip Sidney, London, 1652, in 12mo; 2. Certaine Learned and Elegant Workes of the Right Hon. Fulke Lord Brooke, written in his youth and familiar exercise with Sir Philip Sidney, London, 1633; 3. The Remains of Sir Fulke Greville Lord Brooke, being Poems of Monarchy and Religion, never before printed, London, 1670, in 8vo. Lord Orford erroneously attributes to him "Five Yeares of King James, or the condition of the State of England, and the relation it hath to other Provinces," 1643; a work which was evidently written by one of the Presbyterians, and which was republished with additions in 1651, 4to.

GREVIUS. See Græviuſ.

GREW, Nehemiah, the first vegetable anatomist and physiologist of this country, was born at Coventry about the year 1628. He was educated as a Presbyterian; and on the change of the national form of religion, at the restoration of Charles II., he was sent to study at some foreign university, where he took his degree of doctor of physic. He settled first at Coventry, but removed afterwards to London, where he obtained considerable practice as a physician; and at length succeeded Mr Oldenburg in the office of secretary to the Royal Society. In this capacity, pursuant to an order of council, he drew up a catalogue of the natural and artificial rarities belonging to the society, under the title of *Musæum Regalis Societatis,* 1681. Besides several papers in the Philosophical Transactions, he also wrote, 1. The Comparative Anatomy of the Stomach and Guts, folio; 2. The Anatomy of Vegetables, of Roots and of Trunks, 1682, in folio; 3. *Tractatus de Salis Cathartici Natura et Usu;* 4. *Cosmologia Sacra,* or a Discourse of the Universe, as it is the Creature and Kingdom of God, folio. The works of Grew were translated into French and Latin; but, as it appears, by no means correctly, at least in the latter of these languages. He died suddenly, on the 25th of March 1711.

GREY, Lady Jane, an illustrious and unfortunate lady, descended of the blood-royal of England by both parents, was the eldest daughter of Henry Grey marquis of Dorset, and Frances, daughter of Charles Brandon Lord Suffolk, by Mary, dowager of Louis XII. king of France, and youngest daughter of Henry VII. king of England. Born in the year 1537, at Broadgate, Leicestershire, she discovered an early propensity to all kinds of literature; and having a fine genius, improved under the tuition of Elmer, she made surprising progress in the languages, arts, and sciences. She understood and could express herself with propriety in the Latin and Greek tongues; she was well versed in Hebrew, Chaldee, Arabic, French, and Italian; and she performed instrumental music, and was excellent at the needle. We also learn from Chaloner, that she accompanied her performances on a musical instrument, with a voice exquisitely sweet in itself, assisted by all the graces that art could bestow. In the year 1553, the Dukes of Suffolk and Northumberland, who, after the fall of Somerset, had reached the height of power, began, on the decline of the king's health, to think of preventing that reverse of fortune which, as things then stood, they foresaw would happen upon the death of Edward. To attain this end, no other remedy was judged sufficient but a change in the succession of the crown, and transferring it to their own families, by proclaiming Lady Jane Grey queen. The excellent and amiable qualities which had rendered her dear to all who had the happiness to know her, joined to her near affinity to the king, exposed her to become the tool of an ambition notoriously not her own. Upon this account she was married to Lord Guildford Dudley, fourth son of the Duke of Northumberland, but without discovering to her the real object of the match, which was celebrated with great pomp in the latter end of May, and so much to the king's satisfaction, that he contributed bounteously towards the expense. The young king Edward VI. died in July following; and our fair scholar, with infinite reluctance, overpowered by the solicitations of her ambitious friends, allowed herself to be proclaimed Queen of England, on the strength of a deed of settlement extorted from Edward by her father-in-law the Duke of Northumberland, which set aside the succession of Mary, Elizabeth, and Mary Queen of Scots. But her regal pageantry continued only a few days. Queen Mary's undoubted right prevailed; and the unfortunate Lady Jane Grey, with her husband, being committed to the Tower, were, on the 13th of November, arraigned and found guilty of high treason, and, on the 12th of February following, beheaded on Tower-hill. Her magnanimity in this dreadful catastrophe was astonishing. Immediately before her execution, she addressed herself, with amazing composure, to the weeping multitude, acknowledged the justice of the law, and died in charity with that world which she had so much reason to execrate. Her writings are, 1. Four Latin Epistles, three to Bullenger, and one to her sister Lady Catharine, printed in a book entitled *Epistolæ Helveticæ Reformatoribus, vel ad eos scriptæ*, Tiguri, 1742, 8vo; 2. Her Conference with Fleckenham, Ballard; 3. A Letter to Dr Harding, her father's chaplain, printed in the Phœnix (vol. ii. p. 28); 4. A Prayer for her own use during her confinement (see Fox's *Acts and Monuments*); 5. Four Latin Verses, written in prison with a pin; 6. Her Speech on the Scaffold, Ballard.

Grey-Hound. See Mammalia.

GRIERSON, Constantia, one of the most learned women on record, though she died in 1733, at the early age of twenty-seven, was the daughter of poor parents resident in the county of Kelkenny, in Ireland. She was an excellent Greek and Latin scholar, and understood history, divinity, philosophy, and mathematics. She proved her skill in Latin by her dedication of the Dublin edition of Tacitus to Lord Carteret, and by that of Terence to his son, to whom also she addressed a Greek epigram. She wrote many elegant English poems, several of which were inserted by Mrs Barber amongst her own. When Lord Carteret was lord lieutenant of Ireland, he obtained for her husband Mr Grierson the patent office of king's printer; and to reward the uncommon merit of his wife, caused her life to be included in it.

GRIFFON, or Griffin (*Gryphus*, Γρυψ), in the natural history of the ancients, the name of an imaginary bird of prey, of the eagle species, represented with four legs, wings, and a beak; the upper part resembling an eagle, and the lower a lion. This animal, which was supposed to watch over gold mines and hidden treasures, was consecrated to the sun; and the ancient painters represented the chariot of the sun as drawn by griffins. According to Spanheim, those of Jupiter and Nemesis were similarly provided. The griffin of Scripture is that species of the eagle called in Latin *ossifraga*, or osprey. The griffin is frequently seen on ancient medals, and is still borne in escutcheons. Guillim blazons it rampant, alleging, that any very fierce animal may be so blazoned as well as the lion; but Sylvester, Morgan, and others, use the terms *segreiant* instead of rampant. The griffin was also an architectural ornament in constant use amongst the Greeks, and was copied from them, with the other elegancies of architectural enrichment, by the Romans.

GRIMALDI, Francisco, an eminent painter, generally known by the appellation of *Bolognese*, was born at Bologna in 1606, where he became a disciple of Annibal Caracci, and proved an honour to that illustrious master. From the school of Annibal he went to complete his studies at Rome, and improved himself daily by copying the works of those artists in which he observed the greatest excellence. He died of a dropsy at Rome in 1680, and left a considerable fortune to his children. The genius of Grimaldi directed him chiefly to landscape, which he executed most happily. His colouring is strong, and his touch light and delicate; his situations are uncommonly pleasing, and the leafing of his trees is admirable.

GRIMMA, a bailiwick in the circle of Leipsic, in the kingdom of Saxony, containing five cities, ninety-three villages, and 18,460 inhabitants. The capital, of the same name, is a city situated on the Mulda, containing five churches, 560 houses, and 3500 inhabitants. Several manufactures are carried on, for cloth, flannels, hosiery, cotton articles, linen; surgical, mathematical, and musical instruments; and especially tobacco-pipes, of which some millions are annually made.

GRIMSBY, Great, a borough-town of the county of Lincoln, of the hundred of Bradley, in the division of Lindsay, 171 miles from London, and thirty-six from Lincoln. It stands at the mouth of the river Humber, opposite to Hull. The harbour having been injured, the trade declined; but some recent improvements have produced a revival. It is an ancient borough, and now returns one member to parliament, but formerly two, who were chosen by the freemen, which privilege was obtained by being born in the town, or by marriage with the daughter of a freeman. It had formerly two churches, but only one remains, which is large, in the form of a cross, and contains some handsome monuments. There is an excellent corn market on Thursday. The population amounted in 1801 to 1524, in 1811 to 2747, in 1821 to 3064, and in 1831 to 4225.

GRINDELWALD, a town situated in one of the most picturesque valleys of the canton of Berne, in Switzerland. This valley is, however, 3100 feet above the level of the sea, but is surrounded by the lofty Wetterhorn, Schrechhorn, and Grindelwald Mountains. It contains 5000 inhabitants.

GRINDING, or Trituration, the act of breaking or comminuting a solid body, and reducing it into powder.

Grinding is also used to indicate the rubbing or wearing off the irregular parts of the surface of a body, and reducing it to the destined figure, whatever that may be.

Grinding, in cutlery, is an operation universally understood, by which edge-tools are sharpened. According to the usual practice, this operation is attended with considerable inconvenience, occasioned by the extrication of heat from friction. The steel very soon becomes ignited when the friction is performed on a dry stone; and even when immersed in water, the operation must be slow, to prevent the water from being thrown off by the centrifugal force; whilst, on the other hand, if the water be poured on the stone from above by means of a cock, the quantity will be too small to preserve a sufficiently low temperature. But let the quantity of water be ever so great, if the instrument to be sharpened have not its point or edge so held as to meet the stream, it will almost inevitably be rendered softer.

To remedy these defects in the common mode of grinding, Mr Nicholson made an experiment with a grindstone from Newcastle, of a fine grit, ten inches in diameter, with a block of mahogany, having emery on the face of it. The grindstone and block were fixed on an axis, to be applied occasionally between the centres of a strong lathe. Both were cylindrical, and of the same diameter; the wood was grooved in opposite directions, that the emery might be lodged therein. The face of the stone was left smooth, with a trough under it to contain the water. The cylinder of wood was faced with emery and oil, and the stone was used with water. A file was the instrument ground, and it was proposed to efface all the teeth. The mechanism of the lathe produced the rotation, by which the grinding apparatus made five revolutions in a second. The operation of the stone was slow, and the workman found inconvenience from the water in the trough being soon exhausted; but the emery cylinder cut rather faster. The friction operated by quick changes on the whole surface of the file, yet it soon became too hot to be held conveniently by the uncovered hand; and even when it was held with a cloth, such was the rapid increase of heat as to decompose the oil, which emitted an empyreumatic odour. When the stone became dry, the file was tried on the face of it, which soon became blue, and then nearly red hot. After this both cylinders were covered with tallow, and emery was sprinkled upon the wood cylinder, when the same instrument was again held to the stone in rapid motion. The friction at first was scarcely apparent; but the pressure of the tool soon fused the tallow, and the stone cut very fast. When the tool after some time began to be a little heated, it was removed to a new zone of the cylinder, by which means the temperature was diminished. Similar effects accompanied the use of the wooden cylinder.

When oil was used upon the cylinder of wood, the heat occasioned by the friction raised the temperature of the instrument and of the oil; but when tallow instead of oil was employed, most of the heat was absorbed in fusing that substance. The increased capacity of the melted tallow absorbed this heat, which became latent, and did not raise the temperature; and when the tallow already melted began to grow hot, as well as the tool, the employing another zone of consistent tallow reduced the temperature.

GRINSTEAD, East, a borough-town and extensive parish of the county of Sussex, in the hundred of Rushmonden and rape of Pevensey, twenty-nine miles from London. It is situated on an eminence, and its tower is a prominent object to a large extent of country. It was a burgage tenure borough, and returned two members to parliament; but has been disfranchised. The houses were the property of the Duke of Dorset, but are now in possession of the Earl of Plymouth, to whom they descended by marriage. There is a market, chiefly for corn, held on Thursday. The population amounted in 1801 to 2659, in 1811 to 2804, in 1821 to 3153, and in 1831 to 3364. The assizes for the county are held here alternately with Horsham.

GRIPES, in *Medicine*, a colic or painful disorder of the lower belly, occasioned by irritating matters, or by wind in the intestines.

GRISGRIS, a superstition very prevalent amongst the negroes in the interior parts of Africa. The grisgris, according to Le Maire, are certain Arabic characters mixed with magical figures drawn by the marabouts or priests upon paper. Labat affirms that they are nothing else than scraps of the Koran in Arabic; but this is denied by Barbot, who brought over one of these grisgris to Europe, and showed it to a number of persons deeply skilled in oriental learning, none of whom could find in it the least trace of any character they understood. Yet, after all, this might be owing to the badness of the handwriting; and the words are probably of the Mandingo language, though the characters are an attempt to imitate the Arabic. The poorest negro never goes to war without his grisgris, as a charm against wounds; and if it proves ineffectual, the priest transfers the blame on the immorality of his conduct. These priests invent against all kinds of dangers, and provide in favour of all desires and appetites, grisgris, by virtue of which the possessors may obtain or avoid whatever they like or dislike. These, according to the marabouts, defend them from storms, enemies, diseases, pains, and misfortunes; and preserve health, long life, wealth, honour, and merit. No clergy in the world are more honoured and revered by the people than these impostors are by the negroes; nor are any people in the world more impoverished by their priests than the negroes, a grisgris being frequently sold at three slaves and four or five oxen. The grisgris intended for the head is made in the form of a cross, reaching from the forehead to the neck behind, and from ear to ear; nor are the arms and shoulders neglected. Sometimes they are planted in their bonnets in the form of horns; and at other times they are made like serpents, lizards, or some other animals, cut out of a kind of pasteboard. There are not wanting Europeans, otherwise intelligent seamen and merchants, who are in some degree infected with the weakness of the country, and believe that the negro sorcerers have an actual communication with the devil, and that they are filled with the malignant influence of that evil spirit when they are seen to distort their features and muscles, make horrid grimaces, and at last imitate the appearances exhibited by epileptics.

GRISONS, one of the cantons of Switzerland, called by the inhabitants Graubundten. It has been composed out of three confederacies, called the League of God's House, the League of the Ten Bailiwicks, and the Grey League. These, with some other small portions, had long continued independent states, until 1798, when, after invasion by the French, they were formally united into one state, and admitted as such into the Swiss confederation. It is one of the largest of the cantons, being about 3010 square miles in extent. It is bounded by Glarus, St Gall, and Austria, on the east by the Tyrol, on the south by Austrian Italy and the canton Ticino, and on the west by Uri. It is a most picturesque country. The Alps reach the height of 11,000 feet, with a line of perpetual snow of from 8200 to 8400 feet. There are said to be within the canton 240 glaciers and 56 waterfalls. The valleys are strikingly beautiful, and in them both the Rhine and the Inn have their sources. There are five of these greater valleys, distinguished as the Hither Rhine, the Farther Rhine, Engadine, the Albula, and the Brettegau, and nearly 150 smaller valleys are connected with them, each with its peculiar features. The chief products are those of the dairy, which are exchanged for corn, of which only half as much is raised as the consumption requires. The chief trade is by the passes of the Alps with Milan. The inhabitants are about 83,000, of whom 40,000 speak a lingua-franca, the old Romana rustica; about 30,000 speak German, and 13,000 Italian. The Roman Catholic church has 33,000 adherents, with six ministers and eighty-six parish churches. The Protestants are 50,000, of the Helvetic confession, and have six colleges, with 132 parish churches; but the pastors are so poor that they are often compelled to have recourse to manual labour or trade to support themselves. The government is a pure democracy. The three divisions, as in old times, are still adhered to, and deputies, twenty-one from each portion, meet, and all have separate presidents, and are assisted by councils annually elected. The contingent of men furnished by the cantons to the Swiss confederacy is 1600, and of money 12,000 francs. The annual revenue was, in 1831, L.21,590, and the expenditure L.20,100. The public debt is now nearly extinguished. Chur is the capital of the whole, as well as of

Groningen
||
Gronovius.

the League of God's House; but the League of the Bailiwick has for its capital the town of Davos, and that of the Grey League the town of Dissentis. Chur contains 350 inhabitants, and is on the great road from Germany to Lombardy.

GRIST, in country affairs, denotes corn ground, or ready for grinding.

GRIT, or Gritstone, a kind of stone which is used for building, and for millstones or grindstones, and sometimes for filtrating water.

GROAT, an English money of account, equal to fourpence. Other nations, as the Dutch, Poles, Saxons, Bohemians, and French, have likewise their groats, groots, grochen, gros, and the like. In the Saxon times, no silver coin bigger than a penny was struck in England, nor after the Conquest, till the reign of Edward III., who, about the year 1351, coined grosses or great pieces, which went for fourpence each; and so the matter stood till the reign of Henry VIII., who, in 1504, first coined shillings.

Groats, in country affairs, oats after the husks are taken off, or great oatmeal.

GROCERS were anciently such persons as engrossed all merchandise that was vendible; but now they are incorporated, form one of the companies of the city of London, and deal in sugar, foreign fruits, spices, and other articles.

GRODNO, one of the provinces of West Russia, formerly a part of Lithuania. It is bounded on the north by Wilna, on the east by Minsk, on the south by Volhynia, on the south-west by Poland, and on the west by Bialystock. It extends over 11,792 square miles, and is divided into eight circles, containing 108 towns and 936 villages, with 842,500 inhabitants. The latter consist of Lithuanians, Poles, Russians, Jews, Germans, and gipsies. The nobility are chiefly Poles, the traders are Jews or Poles, the merchants Germans, and the labourers and peasants Lithuanians. The chief city, of the same name, is situated on the river Niemen. It is an ancient town, with palaces of the great Lithuanian nobles, now in a state of decay. It contains twelve churches, of which nine are Catholic, one Greek, and two Lutheran, with 800 houses and 5000 inhabitants. Long. 23. 46. 20. E. Lat. 53. 40. 48. N.

GROENLAND, or Greenland. See Greenland.

GROGRAM, a kind of stuff made of silk and mohair.

GROIN, that part of the abdomen next the thigh.

Groin, amongst builders, is the angular curve formed by the intersection of two semicylinders or arches, and is either regular or irregular. A regular groin is when the intersecting arches, whether semicircular or semielliptical, are of the same diameters and heights. An irregular groin is where one of the arches is semicircular and the other semielliptical.

GROLL, or Groenloo, a town of the Netherlands, in the circle of Zutphen, and province of Guelderland. It stands on the river Slink, and is strongly fortified as a frontier town on the side of Westphalia. It contains 2100 inhabitants.

GRONENBACH, a bailiwick of the circle of the Upper Danube, in the kingdom of Bavaria, extending over 115 square miles. It contains three market-towns, fifty-two villages, and 155 detached agricultural establishments, and 11,492 inhabitants. It is a poor district, mostly covered with woods. The capital, of the same name, has only a population of about 1000 persons.

GRONINGEN, one of the provinces of the Netherlands. It is bounded on the north by the German Ocean, on the east by the mouth of the Ems, the Dollart, and the kingdom of Hanover, on the south by the province of Drenthe, and on the west by that of Friesland. It extends over 806 square miles, and contains 159,321 inhabitants. On the shore there is a tract of land from eighteen to twenty miles in breadth, which, by being well drained and embanked, bears excellent crops of oats and some barley, and feeds a great number of cows. The butter and cheese is however inferior to what is produced in the provinces of Holland and Friesland. The land farther from the shore is generally sandy heath, producing much turf, and yielding with much care, on a large extent, a supply of potatoes. The province is divided into three circles, viz. Groningen, Windshotten, and Apingadam.

Groningen, a city, the capital of the province of the same name, in the Netherlands. It stands on the rivers Hunse and Aa, the waters of both which run through the city, and fill the ditches which surround the walls. It is a well-built town, very strongly fortified, with broad streets and good houses. It contains 6000 dwellings, and in 1819 27,800 inhabitants, who were lessened by the fatal fever which visited the province in 1826, so as in 1831 to be only 26,069. There are manufactures of linen and woollen goods. The university contains nineteen professors, and commonly 200 students. The commerce chiefly consists of the export of oats, butter, cheese, and turf. Long. 6. 34. E. Lat. 53. 10. N.

Groningen, a town of the Prussian province of Saxony, in the circle of Oschersleben. It stands on the river Bode, and contains 421 houses, with 2354 inhabitants, employed in flax and wool spinning. Long. 11. 6. 27. E. Lat. 51. 36. 3. N.

GRONOVIUS, the Latinized form of Gronov, John Frederick, a learned scholar and critic, was born at Hamburg on the 10th of September 1611. His father, who was councillor to the Duke of Holstein, having been appointed syndic or town-clerk of Bremen, carried his son to that city, where he went through his early studies with great distinction. He then visited the universities of Leipsic and Iena, and proceeded to Altdorf, where he studied law under the learned professors who had conferred celebrity on that school. After the death of his father he returned to Bremen, and having settled his affairs, he, in 1634, repaired to Groningen to enjoy the benefit of the society and instructions of Antony Mathieu, a great jurisconsult, and the friend of his family. Here, however, he remained only a short time. For, being desirous to extend his knowledge by travel, he visited the principal cities of Holland, in order to converse with the learned and explore the libraries; passed, with the same design, into England in 1639; and the year following proceeded to France. He stopped several months at Paris; received the degree of doctor of law at Angers; and then travelled into Italy, whence he returned, through Switzerland and Germany, to Deventer, where he was offered the chair of literature and history. In 1658, he succeeded Daniel Heinsius, the celebrated professor of belles-lettres in the university of Leyden, and died in that city on the 28th of December 1671. Gronovius was a man of equal learning and modesty, and, as he was naturally disinclined to controversy, he avoided those literary disputes by which so many then sought to obtain distinction. For a correct list of his numerous works, we refer to the *Biblioth. Erudit. Præcoc.* of Klefeker, and to the *Dictionaire* of Chauffèpié, and shall only mention the following: 1. Diatribe in Statii poetæ Sylvas, Hague, 1637, in 8vo; 2. De Sesterciis sive subsesivorum Pecuniæ veteris Græcæ et Romanæ libri iv. Deventer, 1643, in 4to; 3. Observationum libri iv. Deventer, 1662, in 12mo; 4. Laudatio funebris Joannis Golii, Leyden, 1668, in 8vo; 5. De Musæo Alexandrino Exercitationes Academicæ, inserted in the eighth volume of the *Thesaurus Antiquitatum Græcarum;* 6. Lectiones Plautinæ, quibus non tantum fabulæ Plautinæ et Terentianæ, verum etiam Cæsar, Cicero, Livius illustrantur, Amsterdam, 1740, in 8vo; 7. Notes on the treatise of Grotius *De Jure Belli et Pacis.* Gronovius also revised

Gronovius.

the text, and published editions with notes, of Titus Livius, Statius, Pliny the Elder, Justin, Tacitus, the Senecas, Aulus Gellius, Phædrus, and Paulinus, almost all of which form part of the *Variorum* collection. (A.)

Gronovius, *James*, son of the preceding, and one of the most laborious philologers of the seventeenth century, was born at Deventer on the 20th of October 1645. At an early age he had read all the masterpieces of antiquity, and appreciated their beauties; but this precocious discernment was not so much the result of natural genius as of obstinate perseverance. Having resolved to travel through part of Europe to acquire knowledge, and visit the old friends of his father, he came over to England, where he remained several months, during which he occupied himself in collating the manuscripts in the libraries of Oxford and Cambridge. He then returned to Leyden, and there published, in the year 1670, an edition of Polybius, with notes, amongst which he inserted those that Casaubon had on his death-bed bequeathed to him. This first editorial effort did him much honour, and well merited the offer, which was in consequence made him, of a chair in the academy of Deventer. But entertaining the intention of continuing his travels, he declined the proffered situation, and almost immediately set out for Paris, where he met with a most distinguished reception. The death of his father obliged him to return a second time to Leyden; but as soon as he had arranged his affairs, he again set out, along with M. Paats, ambassador of the states-general, to Spain; and having seen all that is curious or interesting in that country, he embarked for Italy. The Grand Duke of Tuscany retained him in his states by appointing him professor in the university of Pisa; and Gronovius profited by the facility he had of visiting Florence, to form a connection with Magliabecchi, who placed at his disposal all the treasures of the Medicean library. At the end of two years he prevailed on the grand duke to accept his resignation; visited Venice and Padua; and traversed Germany on his way to Deventer, where it was his intention to settle. But scarcely had he arrived in that city when the curators of the university of Leyden tendered him a chair, and pressed their offer so urgently that he was induced to accept. His opening discourse increased the high idea which had been formed of his knowledge; and the curators, to testify their desire of retaining him, immediately raised his salary to four hundred florins. Gronovius was very sensible of this mark of esteem, and constantly refused the propositions which were made to draw him to Kiel, to Padua, and to other universities of Germany and Italy. If he inherited the erudition of his father, he had neither his gentleness nor his moderation. Never was there a man fonder of disputation, or more unjust towards the adversaries whom, for the most part, he raised up against himself by his asperity and haughtiness. It would be tedious, if not disgusting, to enter into details respecting the quarrels he had to maintain with Fabretti on the sense of some passages in Livy; with Feller and Perizonius as to the manner of Judas's death; with Vossius on Pomponius Mela; with Bentley and John Leclerc on the corrections of Menander; with Kuster on Suidas, &c. The scurrility he indulged in these discussions, which did not always terminate to his advantage, and his exorbitant vanity, caused him to be compared to Scioppius, and procured for him the unenviable distinction of a place in the work of Mencken on the Empiricism of the Learned. But though the temper of Gronovius was thus violent, his heart was sound, and he loved his children with so much tenderness that the grief occasioned by the loss of his daughter accelerated his own death, which took place at Leyden on the 21st of October 1716, in the seventy-first year of his age. In the Memoirs of Niceron will be found a notice of his life, followed by a catalogue of his works, forty-six in number. The most celebrated, as well as the most important, of these, is the *Thesaurus Antiquitatum Græcarum*, Leyden, 1697 and the following years, in 13 vols. folio. For this invaluable collection he adopted the plan traced out by Grævius in the *Thesaurus Antiquitatum Romanarum*, Utrecht, 1694, in 12 vols. folio. Both works ought to be united; and, to form a complete collection of antiquities, there should be added, 1. *Novus Thesaurus Antiquitatum Romanarum*, by Sallengre, Hague, 1716, in 3 vols. folio; 2. *Utriusque Thesauri Nova Supplementa*, by Polleni, Venice, 1737, in 5 vols. folio; 3. *Inscriptiones Antiquæ totius Orbis Romani*, by Gruter, Amsterdam, 1707, in 4 vols. folio; 4. *Lexicon Antiquitatum Romanarum*, by Pitiscus, Leuwarden, 1713, in 2 vols. folio. Gronovius published new editions of several authors already commented on by his father, such as Seneca the tragic poet, Aulus Gellius, Phædrus, and others; and he also edited Macrobius, Polybius, Tacitus, Pomponius Mela, Cicero, Ammianus Marcellinus, Quintus Curtius, Suetonius, Arrian, Minutius Felix, Herodotus, Cebes, and some ancient geographers; the poem of Manetho on the stars; the *Dactylotheca* of Gorlæus; the *Lexicon* of Harpocration, &c. the greater part of which, enriched with corrections and notes, form part of the *Variorum* collection, though, in general, not held in much estimation. The other productions of Gronovius consist of Theses, Discourses, and Diatribes, of which a list will be found in the Memoirs of Niceron, and also in the *Biblioth. Erudit. Præcocium* of Klefeker. (A.)

GROOM, a name particularly applied to several superior officers belonging to the king's household, as groom of the chamber, groom of the stole.

Groom is more particularly used for a servant appointed to attend on horses in the stable. The word is formed from the Flemish *grom*, a boy.

GROOTE EYLANDT, a large island on the north coast of New Holland, and on the western shore of the Gulf of Carpentaria. It was so called by the Dutch navigators who first visited this gulf, and is about sixty miles from north to south. It is generally barren and unproductive on the coast; but towards the interior is covered with wood. It extends from lat. 13. 39. to 14. 17. S.

GROOVE, amongst miners, is the shaft or pit sunk into the earth, sometimes in the vein, and sometimes not.

Groove, amongst joiners, the channel made by their plough in the edge of a moulding, style, or rail, to put their panels in, in wainscotting.

GROSE, Francis, born about the year 1731, was the son of Francis Grose, a jeweller of Richmond, by whom the coronation crown of George II. was filled up. Young Grose obtained an independent fortune by the death of his father, which happened in the year 1769. He was then paymaster and adjutant in the Surrey militia, but dissipation so far prevented him for some time from giving proper attention to his duty, that, in his own humorous mode of expressing himself, he kept but two books of accounts, his right and left hand pockets. The losses which this thoughtless conduct occasioned him awakened his dormant talents, and he resolved to turn his attention to literary pursuits. Having received a classical education, he united to it an excellent taste for drawing, which induced him to commence his *Views of Antiquities in England and Wales*. He began this work in numbers in 1773, and completed it in 1776; and by it he obtained both reputation and profit, which last his unpardonable prodigality had rendered extremely welcome. In 1777 he added to his English Views other two volumes, including the islands of Guernsey and Jersey, finished in 1778. All his expectations were fully gratified by the publication of this work; and during the remainder of his life he continued to publish others, which in general increased his reputaon as an author, and tended to augment his substance. n the summer of 1789 he paid a visit to Scotland, and in 790 began to publish in numbers, the Views taken by im in that country. He next proceeded to Ireland, with view to give a similar description of that country; but n the 6th of May 1791, whilst at Dublin, in the house of Ir Horne, he was suddenly seized at table with an apolectic fit, and immediately expired. He was buried in Drumcondra churchyard, near Dublin. Although his lierature was very respectable, it was exceeded by his ood humour, his convivial turn of mind, and his friendly isposition. Both at home and abroad he was always in e best company, and his knowledge of the world was o extensive that his conversation was useful and enteraining. He was free from the malignity and pride of ome authors; for as he felt the independence of his own alents, he scorned to depreciate those of others. Of the ost careless, open, and artless disposition, he was often e prey of the designing, and more than once embarrassd himself by placing too implicit confidence in the probity f others. A tale of distress never failed to touch his heart, nd to bedew his cheek with tears of commiseration. His orks are, 1. The Antiquities of England and Wales, in 8 ols. 4to and 8vo; 2. The Antiquities of Scotland, in 2 vols. to and 8vo; 3. The Antiquities of Ireland, in 2 vols. 4to nd 8vo, a posthumous work edited by Mr Ledwieh, 1794; . A Treatise on ancient Armour and Weapons, 1785, in to; 5. A Classical Dictionary of the Vulgar Tongue, 785, in 8vo; 6. Military Antiquities, being a History of e English Army from the Conquest to the present time, 786, 1788, in 2 vols. 4to; 7. The History of Dover astle by the Rev. William Darell, 1786, in 4to; 8. A rovincial Glossary, with a Collection of Local Proverbs nd Popular Superstitions, 1788, in 8vo; 9. Rules for rawing Caricatures, 1788, in 8vo; 10. Supplement to e Treatise on ancient Armour and Weapons, 1789, in to; 11. A Guide to Health, Beauty, Honour, and Riches, eing a collection of humorous advertisements, pointing ut the means to obtain these blessings, with a suitable ntroductory preface, 8vo; 12. The Olio, a Collection of ssays, Jests, and small pieces of Poetry, highly characeristic of Grose, though not made by him, nor all of his omposition, 1793, in 8vo.

GROSS, amongst us, means twelve dozen.

Gross Weight, is the weight of merchandise and goods ith the dust and dross, as also of the bag, cask, chest, c. in which they are contained; and out of this gross eight allowance is to be made for tare and tret.

Gross
||
Grotesque.

Gross, or *Grossus*, in our ancient law writers, denotes a thing absolute, and not depending on another. Thus, *villein in gross, villanus in grosso*, was a servant who did not belong to the land, but immediately to the person of the lord; or a servile person not appended or annexed to the lord or manor, or an accessory of the tenures as an appurtenant, but, like other personal goods and chattels of his lord, at his lord's pleasure and disposal.

GROSSASPERN, a town of Austria, in the province of the Lower Ens. It is situated on an arm of the Danube, and remarkable for the battle fought there on the 22d and 23d July 1809, which led to the capture of Vienna by the French. It contains 110 houses, and 710 inhabitants.

GROSSCHANAU, a town of the circle of Lausatia, in the kingdom of Saxony. It is situated on the Lousebaeh, and is one of the chief seats of the linen manufacture, especially for damask tablecloths and napkins. It is 1000 feet above the level of the sea. The population is 4600.

GROSSENHAIN, a bailiwick of the circle of Meisen, in the kingdom of Saxony. It contains two cities, two market-towns, and 229 villages, with 24,729 inhabitants. It is a fruitful district, but much of it is covered with forests. The capital, of the same name, is a city standing on the river Roder, which runs to the Elbe. It contains 620 houses, and about 5000 inhabitants, amongst whom are calico printers, weavers, dyers, stocking makers, and other trades. Lat. 51. 18. 6. N.

GROSSWARDEIN, a city of Hungary, in the circle of the Hither Theiss. It is strongly fortified, and is the seat of a bishop, and of the several civil and military boards of the circle. There is a Catholic ecclesiastical seminary, with ten professors, and several religious houses for both males and females. It contains 1200 houses, with 6768 inhabitants. Several natural warm springs in the city are visited by patients. It has considerable trade in the products of its vicinity, the chief of which is wine; and marble is furnished from some valuable quarries. Long. 21. 50. 45. E. Lat. 47. 2. 50. N.

GROTESQUE, in sculpture and painting, something whimsical, extravagant, and monstrous, consisting either of things which are merely imaginary, and have no existence in nature, or of things so distorted as to excite surprise and ridicule. The name arises from the circumstance that figures of this kind were anciently much used to adorn the *grottoes* in which the tombs of eminent persons or families were enclosed. Such was that of Ovid, whose grotto was discovered near Rome more than a century ago.
